Chapter 1

Introduction

1.1 Scope

IEEE Std. 1003.1-200x defines a standard operating system interface and environment, including a command interpreter (or ‘‘shell’’), and common utility programs to support applications portability at the source code level. It is intended to be used by both applications developers and system implementors.

IEEE Std. 1003.1-200x comprises three major components (each in an associated volume):

1. General terms, concepts, and interfaces common to all volumes of IEEE Std. 1003.1-200x, including utility conventions and C language header definitions, are included in the Base Definitions volume of IEEE Std. 1003.1-200x.
2. Definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery, are included in the System Interfaces volume of IEEE Std. 1003.1-200x.
3. Definitions for a standard source code-level interface to command interpretation services (a ‘‘shell’’) and common utility programs for application programs are included in the Shell and Utilities volume of IEEE Std. 1003.1-200x.

The following areas are outside of the scope of IEEE Std. 1003.1-200x:

- Graphics interfaces
- Database management system interfaces
- Record I/O considerations
- Object or binary code portability
- System configuration and resource availability

IEEE Std. 1003.1-200x describes the external characteristics and facilities that are of importance to applications developers, rather than the internal construction techniques employed to achieve these capabilities. Special emphasis is placed on those functions and facilities that are needed in a wide variety of commercial applications.

The facilities provided in IEEE Std. 1003.1-200x are drawn from the following base documents:

- IEEE Std. 1003.1-1996 (POSIX-1) (incorporating IEEE Stds. 1003.1-1990, 1003.1b-1993, 1003.1c-1995, and 1003.1i-1995)
- The following amendments to the POSIX.1-1990 standard:
  - IEEE P1003.1a draft standard (Additional System Services)
  - IEEE Std. 1003.1d-1999 (Additional Realtime Extensions)
  - IEEE Std. 1003.1g-2000 (Protocol-Independent Interfaces (PII))
  - IEEE Std. 1003.1j-2000 (Advanced Realtime Extensions)
  - IEEE Std. 1003.1q-2000 (Tracing)

- IEEE Std. 1003.2-1992 (POSIX-2) (includes IEEE Std. 1003.2a-1992)
- The following amendment to the ISO POSIX-2: 1993 standard:
  - — IEEE P1003.2b draft standard (Additional Utilities)
  - — IEEE Std. 1003.2d-1994 (Batch Environment)
- Open Group Technical Standard, February 1997, System Interface Definitions, Issue 5 (XBD5) (ISBN: 1-85912-186-1, C605)
- Open Group Technical Standard, February 1997, Commands and Utilities, Issue 5 (XCU5) (ISBN: 1-85912-191-8, C604)
- Open Group Technical Standard, February 1997, System Interfaces and Headers, Issue 5 (XSH5) (in 2 Volumes) (ISBN: 1-85912-181-0, C606)

  Note: XBD5, XCU5, and XSH5 are collectively referred to as the *Base Specifications*.
- Open Group Technical Standard, January 2000, Networking Services, Issue 5.2 (XNS5.2) (ISBN: 1-85912-241-8, C808)
- ISO / IEC 9899: 1999, Programming Languages — C.

IEEE Std. 1003.1-200x uses the *Base Specifications* as its organizational basis and adds the following additional functionality to them drawn from the base documents above:

- Normative text from the ISO POSIX-1: 1996 standard and the ISO POSIX-2: 1993 standard not included in the *Base Specifications*
- The amendments to the POSIX.1-1990 standard and the ISO POSIX-2: 1993 standard listed above, except for parts of IEEE Std. 1003.1g-2000
- Portability Considerations
- Additional rationale and notes

The following features, marked legacy or obsolescent in the base documents, are not carried forward into IEEE Std. 1003.1-200x. Other features from the base documents marked legacy or obsolescent are carried forward unless otherwise noted.

From XSH5, the following legacy interfaces, headers, and external variables are not carried forward:

advance( ), *brk*( ), *chroot*( ), *compile*( ), *cuserid*( ), *gamma*( ), *getdtablesize*( ), *getpagesize*( ), *getpass*( ), *getw*( ), *putw*( ), *re_comp*( ), *re_exec*( ), *regcmp*( ), *sbrk*( ), *sigstack*( ), *wait3*( ), **<re_comp.h>**, **<regexp.h>**, **<varargs.h>**, *loc1*, *__loc1*, *loc2*, *locs*

From XCU5, the following legacy utilities are not carried forward:

calendar, *cancel*, *cc*, *col*, *cpio*, *cu*, *dircmp*, *dis*, *egrep*, *fgrep*, *line*, *lint*, *lpstat*, *mail*, *pack*, *pcat*, *pg*, *spell*, *sum*, *tar*, *unpack*, *uulog*, *uuname*, *uupick*, *uuto*

In addition, legacy features within non-legacy reference pages (for example, headers) are not carried forward.

From the ISO POSIX-1: 1996 standard, the following obsolescent features are not carried forward:

Page 112, CLK_TCK
Page 197 *tcgetattr*( ) rate returned option

From the ISO POSIX-2: 1993 standard, obsolescent features within the following pages are not carried forward:

Page 75 zero-length prefix within PATH
Page 156, 159 *set*,
Page 178, *awk*, use of no argument and no parentheses with length
Page 259, *ed*
Page 272, *env*
Page 282, *find* –**perm**[–]*onum*,
Page 295-296, *egrep*
Page 299-300, *head*
Page 305-306, *join*
Page 309-310, *kill*
Page 431-433, 435-436, *sort*
Page 444-445, *tail*
Page 453, 455-456, *touch*
Page 464-465, *tty*
Page 472, *uniq*
Page 515-516, *ex*
Page 542-543, *expand*
Page 563-565, *more*
Page 574-576, *newgrp*
Page 578, *nice*
Page 594-596, *renice*
Page 597-598, *split*
Page 600-601, *strings*
Page 624-625, *vi*
Page 693, *lex*

The *c89* utility (which specified a compiler for the C Language specified by the ISO/IEC 9899:1990 standard) has been replaced by a *c99* utility (which specifies a compiler for the C Language specified by the ISO/IEC 9899:1999 standard).

From XSH5, text marked OH has been reviewed on a case-by-case basis and removed where appropriate. The XCU5 text marked OF, OP, PI, and UN has been reviewed on a case-by-case basis and removed where appropriate

For the networking interfaces, the base document is the XNS, Issue 5.2 specification. The following parts of the XNS, Issue 5.2 specification are out of scope and not included in IEEE Std. 1003.1-200x:

- Part 3 (XTI)
- Part 4 (Appendixes)

Since there is much duplication between the XNS, Issue 5.2 specification and IEEE Std. 1003.1g-2000, material only from the following sections of IEEE Std. 1003.1g-2000 has been considered for inclusion:

- General terms related to sockets (Clause 2.2.2)
- Socket concepts (Clauses 5.1 through 5.3, inclusive)
- The *pselect*( ) function (Clauses 6.2.2.1 and 6.2.3)
- The *isfdtype*( ) function (Clause 5.4.8)
- The **<sys/select.h>** header (Clause 6.2)

Emphasis is placed on standardizing existing practice for existing users, with changes and additions limited to correcting deficiencies in the following areas:

- Issues raised by IEEE or ISO/IEC Interpretations against IEEE Std. 1003.1 and IEEE Std. 1003.2
- Issues raised in corrigenda for the *Base Specifications* and working group resolutions from The Open Group
- Corrigenda and resolutions passed by The Open Group for the XNS, Issue 5.2 specification
- Changes to make the text self-consistent with the additional material merged
- A reorganization of the options in order to facilitate profiling, both for smaller profiles such as IEEE Std 1003.13, and larger profiles such as the Single UNIX Specification
- Alignment with the ISO/IEC 9899:1999 standard

1.2 Conformance

Conformance requirements for IEEE Std. 1003.1-200x are defined in Chapter 2 (on page 19).

1.3 Normative References

The following standards contain provisions which, through references in this text, constitute provisions of this volume of IEEE Std. 1003.1-200x. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this volume of IEEE Std. 1003.1-200x are encouraged to investigate the possibility of applying the most recent editions of the standards listed below. Members of IEC and ISO maintain registers of currently valid International Standards.

Notes to Reviewers

This section with side shading will not appear in the final copy. - Ed.

The following list will be updated.

ANS X3.9-1978
(Reaffirmed 1989) American National Standard Programming Language FORTRAN.[1]

ISO / IEC 646
ISO / IEC 646: 1991, Information Processing — ISO 7-bit Coded Character Set for Information Interchange.[2]

ISO 4217
ISO 4217: 1995, Codes for the Representation of Currencies and Funds.

ISO / IEC 4873
ISO / IEC 4873: 1991, Information Technology — ISO 8-bit Code for Information Interchange — Structure and Rules for Implementation.

ISO 8601
ISO 8601: 1988, Data Elements and Interchange Formats — Information Interchange — Representation of Dates and Times.

ISO 8859-1
ISO 8859-1: 1988, Information Processing — 8-bit Single-byte Coded Graphic Character Sets — Part 1: Latin Alphabet No. 1.

ISO 8859-2
ISO 8859-2: 1987, Information Processing — 8-bit Single-byte Coded Graphic Character Sets — Part 2: Latin Alphabet No. 2.

ISO / IEC 9899
ISO / IEC 9899: 1999, Programming Languages — C.

ISO / IEC 9945-1
ISO / IEC 9945-1: 200x, Information Technology — Portable Operating System Interface (POSIX) — Part 1: System Application Program Interface (API) [C Language] (identical to ANSI / IEEE Std 1003.1-200x).[3]

---

1. ANSI documents can be obtained from the Sales Department, American National Standards Institute, 1430 Broadway, New York, NY 10018, U.S.A.
2. ISO / IEC documents can be obtained from the ISO office: 1 Rue de Varembé, Case Postale 56, CH-1211, Genève 20, Switzerland / Suisse
3. This standard is available from the IEEE Service Center, 445 Hoes Lane, P.O. Box 1331, Piscataway, NJ 08855-1331, U.S.A. Tel: 1 (800) 678-IEEE or +1 (908) 981-1393.

ISO/IEC 9945-2

ISO/IEC 9945-2:1993, Information Technology — Portable Operating System Interface (POSIX) — Part 2: Shell and Utilities.

ISO/IEC 10646-1

ISO/IEC 10646-1:1993, Information Technology — Universal Multiple-Octet Coded Character Set (UCS) — Part 1: Architecture and Basic Multilingual Plane.

ISO/IEC 14519:1999

ISO/IEC 14519:1999, Information Technology — POSIX Ada Language Interfaces — Binding for System Application Program Interface (API) — Realtime Extensions.

1.4 Terminology

For the purposes of IEEE Std. 1003.1-200x, the following terminology definitions apply:

can

Describes a permissible optional feature or behavior available to the user or application. The feature or behavior is mandatory for an implementation that conforms to IEEE Std. 1003.1-200x. An application can rely on the existence of the feature or behavior.

implementation-defined

Describes a value or behavior that is not defined by IEEE Std. 1003.1-200x but is selected by an implementor. The value or behavior may vary among implementations that conform to IEEE Std. 1003.1-200x. An application should not rely on the existence of the value or behavior. An application that relies on such a value or behavior cannot be assured to be portable across conforming implementations.

The implementor shall document such a value or behavior so that it can be used correctly by an application.

legacy

Describes a feature or behavior that is being retained for compatibility with older applications, but which has limitations which make it inappropriate for developing portable applications. New applications should use alternative means of obtaining equivalent functionality.

may

Describes a feature or behavior that is optional for an implementation that conforms to IEEE Std. 1003.1-200x. An application should not rely on the existence of the feature or behavior. An application that relies on such a feature or behavior cannot be assured to be portable across conforming implementations.

To avoid ambiguity, the opposite of *may* is expressed as *need not*, instead of *may not*.

shall

For an implementation that conforms to IEEE Std. 1003.1-200x, describes a feature or behavior that is mandatory. An application can rely on the existence of the feature or behavior.

For an application or user, describes a behavior that is mandatory.

should

For an implementation that conforms to IEEE Std. 1003.1-200x, describes a feature or behavior that is recommended but not mandatory. An application should not rely on the existence of the feature or behavior. An application that relies on such a feature or behavior cannot be assured to be portable across conforming implementations.

For an application, describes a feature or behavior that is recommended programming practice for optimum portability.

undefined

Describes the nature of a value or behavior not defined by IEEE Std. 1003.1-200x which results from use of an invalid program construct or invalid data input.

The value or behavior may vary among implementations that conform to IEEE Std. 1003.1-200x. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

unspecified

Describes the nature of a value or behavior not specified by IEEE Std. 1003.1-200x which results from use of a valid program construct or valid data input.

The value or behavior may vary among implementations that conform to IEEE Std. 1003.1-200x. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

1.5 Portability

Some of the utilities in the Shell and Utilities volume of IEEE Std. 1003.1-200x and functions in the System Interfaces volume of IEEE Std. 1003.1-200x describe functionality that might not be fully portable to systems meeting the requirements for POSIX conformance (see the Base Definitions volume of IEEE Std. 1003.1-200x, Chapter 2, Conformance).

Where optional, enhanced, or reduced functionality is specified, the text is shaded and a code in the margin identifies the nature of the option, extension, or warning (see Section 1.5.1). For maximum portability, an application should avoid such functionality.

Unless the primary task of a utility is to produce textual material on its standard output, application developers should not rely on the format or content of any such material that may be produced. Where the primary task *is* to provide such material, but the output format is incompletely specified, the description is marked with the OF margin code and shading. Application developers are warned not to expect that the output of such an interface on one system is any guide to its behavior on another system.

1.5.1 Codes

The codes and their meanings are as follows. See also Section 1.5.2 (on page 17).

ADV Advisory Information
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the ADV margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the ADV margin legend.

AIO Asynchronous Input and Output
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the AIO margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the AIO margin legend.

BAR Barriers
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the BAR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the BAR margin legend.

BE Batch Environment Services and Utilities
The functionality described is optional.

Where applicable, utilities are marked with the BE margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the BE margin legend.

CD C-Language Development Utilities
The functionality described is optional.

Where applicable, utilities are marked with the CD margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the CD margin legend.

CPT **Process CPU-Time Clocks**
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the CPT margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the CPT margin legend.

CS **Clock Selection**
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the CS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the CS margin legend.

CX **Extension to the ISO C standard**
The functionality described is an extension to the ISO C standard. Application writers may make use of an extension as it is supported on all IEEE Std. 1003.1-200x-conforming systems.

FD **FORTRAN Development Utilities**
The functionality described is optional.

Where applicable, utilities are marked with the FD margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the FD margin legend.

FR **FORTRAN Runtime Utilities**
The functionality described is optional.

Where applicable, utilities are marked with the FR margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the FR margin legend.

FSC **File Synchronization**
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the FSC margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the FSC margin legend.

IP6 **IPV6**
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the IP6 margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the IP6 margin legend.

MAN **Mandatory in the Next Draft**
This is an interim draft code used to aid reviewers during the development of IEEE Std. 1003.1-200x. It denotes a feature that was previously an option or extension that is being brought into the mandatory base functionality. This margin code will be removed from the final draft.

MF **Memory Mapped Files**
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MF margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MF margin legend.

ML Process Memory Locking

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the ML margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the ML margin legend.

MLR Range Memory Locking

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MLR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MLR margin legend.

MON Monotonic Clock

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MON margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MON margin legend.

MPR Memory Protection

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MPR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MPR margin legend.

MSG Message Passing

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MSG margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MSG margin legend.

OB Obsolescent

The functionality described may be withdrawn in a future version of this volume of IEEE Std. 1003.1-200x. Strictly Conforming POSIX Applications and Strictly Conforming XSI Applications shall not use obsolescent features.

OF Output Format Incompletely Specified

The functionality described is an XSI extension. The format of the output produced by the utility is not fully specified. It is therefore not possible to post-process this output in a consistent fashion. Typical problems include unknown length of strings and unspecified field delimiters.

OH Optional Header

In the SYNOPSIS section of some interfaces in the System Interfaces volume of IEEE Std. 1003.1-200x an included header is marked as in the following example:

OH
```
#include <sys/types.h>
#include <grp.h>
struct group *getgrnam(const char *name);
```

This indicates that the marked header is not required on XSI-conformant systems.

PIO Prioritized Input and Output

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the PIO margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the PIO margin legend.

PS Process Scheduling

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the PS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the PS margin legend.

RTS Realtime Signals Extension

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the RTS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the RTS margin legend.

SD Software Development Utilities

The functionality described is optional.

Where applicable, utilities are marked with the SD margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the SD margin legend.

SEM Semaphores

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SEM margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SEM margin legend.

SHM Shared Memory Objects

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SHM margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SHM margin legend.

SIO Synchronized Input and Output

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SIO margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SIO margin legend.

SPI Spin Locks

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SPI margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SPI margin legend.

SPN Spawn

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SPN margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SPN margin legend.

SS Process Sporadic Server

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SS margin legend.

TCT Thread CPU-Time Clocks

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TCT margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TCT margin legend.

THR Threads

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the THR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the THR margin legend.

TMO Timeouts

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TMO margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TMO margin legend.

TMR Timers

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TMR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TMR margin legend.

TPI Threads Priority Inheritance

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TPI margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TPI margin legend.

TPP Thread Priority Protection

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TPP margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TPP margin legend.

TPS Thread Execution Scheduling

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TPS margin legend for the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TPS margin legend.

TRC Trace

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TRC margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TRC margin legend.

TEF Trace Event Filter

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TEF margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TEF margin legend.

TRL Trace Log

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TRL margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TRL margin legend.

TRI Trace Inherit

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TRI margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TRI margin legend.

TSA Thread Stack Address Attribute

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TPS margin legend for the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSA margin legend.

TSF **Thread-Safe Functions**
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TSF margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSF margin legend.

TSH **Thread Process-Shared Synchronization**
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TSH margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSH margin legend.

TSP **Thread Sporadic Server**
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TSP margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSP margin legend.

TSS **Thread Stack Address Size**
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TSS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSS margin legend.

TYM **Typed Memory Objects**
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TYM margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TYM margin legend.

UN **Possibly Unsupportable Feature**
The functionality described is an XSI extension. It need not be possible to implement the required functionality (as defined) on all conformant systems and the functionality need not be present. This may, for example, be the case where the conformant system is hosted and the underlying system provides the service in an alternative way.

UP **User Portability Utilities**
The functionality described is optional.

Where applicable, utilities are marked with the UP margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the UP margin legend.

XSI **Extension**
The functionality described is an XSI extension. Functionality marked XSI is also an extension to the ISO C standard. Application writers may confidently make use of an extension on all systems supporting the X/Open System Interfaces Extension.

If an entire SYNOPSIS section is shaded and marked with one XSI, all the functionality described in that reference page is an extension. See Section 3.441 (on page 117).

XSR XSI STREAMS

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the XSR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the XSR margin legend.

1.5.2 Margin Code Notation

Some of the functionality described in IEEE Std. 1003.1-200x depends on support of more than one option, or independently may depend on several options. The following notation for margin codes is used to denote the following cases:

- A feature dependent on one or two options.

  In this case, margin codes have a <space> separator; for example:

  MF This feature requires support for only the Memory Mapped Files option.

  MF SHM This feature requires support for both the Memory Mapped Files and the Shared Memory Objects options; that is, an application which uses this feature is portable only between implementations that provide both options.

- A feature dependent on either of the options denoted.

  In this case, margin codes have a '|' separator to denote the logical OR; for example:

  MF|SHM This feature is dependent on support for either the Memory Mapped Files option or the Shared Memory Objects option; that is, an application which uses this feature is portable between implementations that provide any (or all) of the options.

- A feature dependent on more than two options.

  The following special notations are used:

  code1 ADV (MF|SHM) This feature requires support of the Advisory Informtion option and either the Memory Mapped Files or Shared Memory Objects option.

  code2 MF|SHM|MPR This feature requires support of either the Memory Mapped Files, Shared Memory Objects, or Memory Protection options.

Where large sections of text are dependent on support for an option, a lead-in text block is provided and shaded accordingly; for example:

TRC This section describes extensions to support tracing of user applications. This functionality is dependent on support of the Trace option (and the rest of this section is not further shaded for this option).

Chapter 2

Conformance

2.1 Implementation Conformance

2.1.1 Requirements

A *conforming implementation* shall meet all of the following criteria:

1. The system shall support all utilities, functions, and facilities defined within IEEE Std. 1003.1-200x that are required for POSIX conformance (see Section 2.1.3 (on page 20)). These interfaces shall support the functional behavior described herein.
2. The system may support one or more options as described under Section 2.1.5 (on page 25). When an implementation claims that an option is supported, all of its constituent parts shall be provided.
3. The system may support the X/Open System Interface Extension (XSI) as described under Section 2.1.4 (on page 23).
4. The system may provide additional utilities, functions, or facilities not required by IEEE Std. 1003.1-200x. Non-standard extensions of the utilities, functions, or facilities specified in IEEE Std. 1003.1-200x should be identified as such in the system documentation. Non-standard extensions, when used, may change the behavior of utilities, functions, or facilities defined by IEEE Std. 1003.1-200x. The conformance document shall define an environment in which an application can be run with the behavior specified by IEEE Std. 1003.1-200x. In no case shall such an environment require modification of a Strictly Conforming POSIX Application (see Section 2.2.1 (on page 38)).

2.1.2 Documentation

A conformance document with the following information shall be available for an implementation claiming conformance to IEEE Std. 1003.1-200x. The conformance document shall have the same structure as IEEE Std. 1003.1-200x, with the information presented in the appropriate sections and subsections. Sections and subsections that consist solely of subordinate section titles, with no other information, are not required. The conformance document shall not contain information about extended facilities or capabilities outside the scope of IEEE Std. 1003.1-200x.

The conformance document shall contain a statement that indicates the full name, number, and date of the standard that applies. The conformance document may also list international software standards that are available for use by a Conforming POSIX Application. Applicable characteristics where documentation is required by one of these standards, or by standards of government bodies, may also be included.

The conformance document shall describe the limit values found in the headers **<limits.h>** (on page 281) and **<unistd.h>** (on page 437), stating values, the conditions under which those values may change, and the limits of such variations, if any.

The conformance document shall describe the behavior of the implementation for all implementation-defined features defined in IEEE Std. 1003.1-200x. This requirement shall be met by listing these features and providing either a specific reference to the system documentation or providing full syntax and semantics of these features. When the value or behavior in the

implementation is designed to be variable or customized on each instantiation of the system, the implementation provider shall document the nature and permissible ranges of this variation.

The conformance document may specify the behavior of the implementation for those features where IEEE Std. 1003.1-200x states that implementations may vary or where features are identified as undefined or unspecified.

The conformance document shall not contain documentation other than that specified in the preceding paragraph except where such documentation is specifically allowed or required by other provisions of IEEE Std. 1003.1-200x.

The phrases ‘‘shall document’’ or ‘‘shall be documented’’ in IEEE Std. 1003.1-200x mean that documentation of the feature shall appear in the conformance document, as described previously, unless there is an explicit reference in the conformance document to show where the information can be found in the system documentation.

The system documentation should also contain the information found in the conformance document.

2.1.3 POSIX Conformance

A conforming implementation shall meet the following criteria for POSIX conformance.

2.1.3.1 POSIX System Interfaces

- The system shall set the symbolic constant _POSIX_BASE to a value other than –1.
- The system shall support the following symbolic constants, reflecting mandatory Profiling Option Groups for IEEE Std. 1003.1-200x (see Section 2.1.5 (on page 25)):
  - — _POSIX_C_LANG_SUPPORT
  - — _POSIX_DEVICE_IO
  - — _POSIX_DEVICE_SPECIFIC
  - — _POSIX_FD_MGMT
  - — _POSIX_FIFO
  - — _POSIX_FILE_ATTRIBUTES
  - — _POSIX_FILE_SYSTEM
  - — _POSIX_JOB_CONTROL
  - — _POSIX_MULTIPLE_PROCESS
  - — _POSIX_PIPE
  - — _POSIX_SIGNALS
  - — _POSIX_SINGLE_PROCESS
  - — _POSIX_SYSTEM_DATABASE
  - — _POSIX_USER_GROUPS
  - — _POSIX_NETWORKING
- The system may support one or more Profiling Option Groups (see Section 2.1.5.1 (on page 25)) denoted by the following symbolic constants:

660 — _POSIX_C_LANG_SUPPORT_R

661 — _POSIX_FILE_LOCKING

662 — _POSIX_SYSTEM_DATABASE_R

663 — _POSIX_USER_GROUPS_R

664 • Although all implementations conforming to IEEE Std. 1003.1-200x support all the features
665 described below, there may be system-dependent or file system-dependent configuration
666 procedures that can remove or modify any or all of these features. Such configurations
667 should not be made if strict compliance is required.

668 The following symbolic constants shall either be undefined or defined with a value other
669 than –1. If a constant is undefined, an application should use the *sysconf*( ), *pathconf*( ), or
670 *fpathconf*( ) functions, or the *getconf* utility, to determine which features are present on the
671 system at that time or for the particular path name in question.

672 — _POSIX_CHOWN_RESTRICTED

673 The use of *chown*( ) is restricted to a process with appropriate privileges, and to changing
674 the group ID of a file only to the effective group ID of the process or to one of its
675 supplementary group IDs.

676 — _POSIX_NO_TRUNC

677 Path name components longer than {NAME_MAX} generate an error.

678 • The following symbolic constants shall be defined with a value other than –1:

679 — _POSIX_JOB_CONTROL |

680 — _POSIX_SAVED_IDS |

681 — _POSIX_VDISABLE |

682 **Note:** The symbols above represent historical options that are no longer allowed as |
683 options, but are retained here for backwards-compatibility of applications. |

684 • The system may support one or more options (see Section 2.1.6 (on page 32)) denoted by the |
685 following symbolic constants:

686 — _POSIX_ADVISORY_INFO

687 — _POSIX_ASYNCHRONOUS_IO

688 — _POSIX_BARRIERS

689 — _POSIX_CLOCK_SELECTION

690 — _POSIX_CPUTIME

691 — _POSIX_FSYNC

692 — _POSIX_IPV6

693 — _POSIX_MAPPED_FILES

694 — _POSIX_MEMLOCK

695 — _POSIX_MEMLOCK_RANGE

696 — _POSIX_MEMORY_PROTECTION

697 — _POSIX_MESSAGE_PASSING

698 — _POSIX_MONOTONIC_CLOCK
699 — _POSIX_PRIORITIZED_IO
700 — _POSIX_PRIORITY_SCHEDULING
701 — _POSIX_RAW_SOCKETS
702 — _POSIX_REALTIME_SIGNALS |
703 — _POSIX_SEMAPHORES
704 — _POSIX_SHARED_MEMORY_OBJECTS
705 — _POSIX_SPAWN
706 — _POSIX_SPIN_LOCKS
707 — _POSIX_SPORADIC_SERVER
708 — _POSIX_SYNCHRONIZED_IO
709 — _POSIX_THREAD_ATTR_STACKADDR
710 — _POSIX_THREAD_CPUTIME
711 — _POSIX_THREAD_ATTR_STACKSIZE
712 — _POSIX_THREAD_PRIO_INHERIT
713 — _POSIX_THREAD_PRIO_PROTECT
714 — _POSIX_THREAD_PRIORITY_SCHEDULING
715 — _POSIX_THREAD_PROCESS_SHARED
716 — _POSIX_THREAD_SAFE_FUNCTIONS
717 — _POSIX_THREAD_SPORADIC_SERVER
718 — _POSIX_THREADS
719 — _POSIX_TIMEOUTS
720 — _POSIX_TIMERS
721 — _POSIX_TRACE |
722 — _POSIX_TRACE_EVENT_FILTER |
723 — _POSIX_TRACE_INHERIT |
724 — _POSIX_TRACE_LOG |
725 — _POSIX_TYPED_MEMORY_OBJECTS |

726 If any of the symbolic constants _POSIX_TRACE_EVENT_FILTER, _POSIX_TRACE_LOG, or |
727 _POSIX_TRACE_INHERIT is defined to have a value other than –1, then the symbolic |
728 constant _POSIX_TRACE shall also be defined to have a value other than –1. |

729 XSI • The system may support the XSI extensions (see Section 2.1.5.2 (on page 27)) denoted by the
730 following symbolic constants:

731 — _XOPEN_CRYPT
732 — _XOPEN_LEGACY

733 — _XOPEN_REALTIME

734 — _XOPEN_REALTIME_THREADS

735 — _XOPEN_UNIX

736 *2.1.3.2 POSIX Shell and Utilities*

737 • The system shall provide all the mandatory utilities in the Shell and Utilities volume of
738 IEEE Std. 1003.1-200x with all the functional behavior described therein.

739 • The system shall support the Large File capabilities described in the Shell and Utilities
740 volume of IEEE Std. 1003.1-200x.

741 • The system may support one or more options (see Section 2.1.6 (on page 32)) denoted by the
742 following symbolic constants. (The literal names below apply to the *getconf* utility.)

743 — POSIX2_C_DEV

744 — POSIX2_CHAR_TERM

745 — POSIX2_FORT_DEV

746 — POSIX2_FORT_RUN

747 — POSIX2_LOCALEDEF

748 — POSIX2_PBS

749 — POSIX2_PBS_ACCOUNTING

750 — POSIX2_PBS_LOCATE

751 — POSIX2_PBS_MESSAGE

752 — POSIX2_PBS_TRACK

753 — POSIX2_SW_DEV

754 — POSIX2_UPE

755 • The system may support the XSI extensions (see Section 2.1.4).

756 Additional language bindings and development utility options may be provided in other related
757 standards or in a future version of IEEE Std. 1003.1-200x. In the former case, additional symbolic
758 constants of the same general form as shown in this subsection should be defined by the related
759 standard document and made available to the application without requiring
760 IEEE Std. 1003.1-200x to be updated.

761 ## 2.1.4 XSI Conformance

762 XSI IEEE Std. 1003.1-200x describes utilities, functions, and facilities offered to application programs
763 by the X/Open System Interface (XSI). An XSI-conforming implementation shall meet the
764 criteria for POSIX conformance and the following requirements.

765 *2.1.4.1 XSI System Interfaces*

766 • The system shall support all the functions and headers defined in IEEE Std. 1003.1-200x as
767 part of the XSI extension denoted by the symbolic constant _XOPEN_UNIX and any
768 extensions marked with the XSI extension marking (see Section 1.5.1 (on page 10)).

769 • The system shall support the *mmap*( ), *munmap*( ), and *msync*( ) functions.

- The system shall support the following options defined within IEEE Std. 1003.1-200x (see Section 2.1.6 (on page 32)):
  - — _POSIX_FSYNC
  - — _POSIX_MAPPED_FILES
  - — _POSIX_MEMORY_PROTECTION
  - — _POSIX_THREAD_ATTR_STACKADDR
  - — _POSIX_THREAD_ATTR_STACKSIZE
  - — _POSIX_THREAD_PROCESS_SHARED
  - — _POSIX_THREAD_SAFE_FUNCTIONS
  - — _POSIX_THREADS
- The system shall support the following Profiling Option Groups (see Section 2.1.5.1 (on page 25)) defined within IEEE Std. 1003.1-200x:
  - — _POSIX_C_LANG_SUPPORT_R
  - — _POSIX_FILE_LOCKING
  - — _POSIX_SYSTEM_DATABASE_R
  - — _POSIX_USER_GROUPS_R
- The system may support the following XSI Option Groups (see Section 2.1.5.2 (on page 27)) defined within IEEE Std. 1003.1-200x:
  - — _XOPEN_CRYPT
  - — _XOPEN_LEGACY
  - — _XOPEN_REALTIME
  - — _XOPEN_REALTIME_THREADS

2.1.4.2 *XSI Shell and Utilities Conformance*

- The system shall support all the utilities defined in the Shell and Utilities volume of IEEE Std. 1003.1-200x as part of the XSI extension denoted by the XSI marking in the SYNOPSIS section, and any extensions marked with the XSI extension marking (see Section 1.5.1 (on page 10)) within the text.
- The system shall support the User Portability Utilities option.
- The system shall support creation of locales (see Chapter 7 (on page 143)).
- The C-language Development utility *c99* shall be supported.
- The XSI Development Utilities option may be supported. It consists of the following software development utilities:

admin	*delta*	*rmdel*	*val*			
cflow	*get*	*sact*	*what*			
ctags	*m4*	*sccs*				
cxref	*prs*	*unget*				

- Within the utilities that are provided, functionality marked by the codes OF, OP, PI, or UN (see Section 1.5.1 (on page 10)) need not be provided.

2.1.5 Option Groups

An Option Group is a group of related functions or options defined within the System Interfaces volume of IEEE Std. 1003.1-200x.

If an implementation supports an Option Group, then the system shall support the functional behavior described herein.

If an implementation does not support an Option Group, then the system need not support the functional behavior described herein.

2.1.5.1 Profiling Option Groups

The following Option Groups are defined to support profiling. These Option Groups allow profiles to subset the System Interfaces volume of IEEE Std. 1003.1-200x by defining sets of functions, denoted by the following symbolic constants:

_POSIX_C_LANG_SUPPORT: General C Library Support
abs( ), *acos*( ), *asctime*( ), *asin*( ), *atan*( ), *atan2*( ), *atof*( ), *atoi*( ), *atol*( ), *bsearch*( ), *calloc*( ), *ceil*( ), *cos*( ), *cosh*( ), *ctime*( ), *exp*( ), *fabs*( ), *floor*( ), *fmod*( ), *free*( ), *frexp*( ), *gmtime*( ), *idexp*( ), *isalnum*( ), *isalpha*( ), *iscntrl*( ), *isdigit*( ), *isgraph*( ), *islower*( ), *isprint*( ), *ispunct*( ), *isspace*( ), *isupper*( ), *isxdigit*( ), *localtime*( ), *log*( ), *log10*( ), *longjmp*( ), *malloc*( ), *mktime*( ), *modf*( ), *pow*( ), *qsort*( ), *rand*( ), *realloc*( ), *setjmp*( ), *sin*( ), *sinh*( ), *sqrt*( ), *srand*( ), *strcat*( ), *strchr*( ), *strcmp*( ), *strcpy*( ), *strcspn*( ), *strlen*( ), *strncat*( ), *strncmp*( ), *strncpy*( ), *strpbkr*( ), *strrchr*( ), *strspn*( ), *strstr*( ), *strtok*( ), *tan*( ), *tanh*( ), *tolower*( ), *toupper*( )

_POSIX_C_LANG_SUPPORT_R: Thread-Safe C-Language Support
asctime_r( ), *ctime_r*( ), *gmtime_r*( ), *localtime_r*( ), *readdir_r*( ), *rand_r*( ), *strtok_r*( )

_POSIX_DEVICE_IO: Device Input and Output
close( ), *clearerr*( ), *getc*( ), *getchar*( ), *gets*( ), *fclose*( ), *fdopen*( ), *feof*( ), *ferror*( ), *fflush*( ), *fgetc*( ), *fgets*( ), *fileno*( ), *fopen*( ), *fprintf*( ), *fputc*( ), *fputs*( ), *fread*( ), *freopen*( ), *fscanf*( ), *fwrite*( ), *open*( ), *perror*( ), *printf*( ), *putc*( ), *putchar*( ), *puts*( ), *read*( ), *sprintf*( ), *scanf*( ), *sscanf*( ), *setbuf*( ), *ungetc*( ), *write*( )

_POSIX_DEVICE_SPECIFIC: General Terminal Interface
cfgetospeed( ), *cfsetispeed*( ), *cfsetospeed*( ), *ctermid*( ), *isatty*( ), *tcgetattr*( ), *tcsetattr*( ), *tcsendbreak*( ), *tcdrain*( ), *tcflush*( ), *tcflow*( ), *ttyname*( )

_POSIX_DEVICE_SPECIFIC_R: Thread-Safe General Terminal Interface
ttyname_r( )

_POSIX_FD_MGMT: File Descriptor
dup( ), *dup2*( ), *fcntl*( ), *fseek*( ), *ftell*( ), *lseek*( ), *rewind*( )

_POSIX_FIFO: FIFO
mkfifo( )

_POSIX_FILE_ATTRIBUTES: File Attributes
chmod( ), *chown*( ), *umask*( )

_POSIX_FILE_LOCKING: Thread-Safe Stdio Locking
flockfile( ), *ftrylockfile*( ), *funlockfile*( ), *getc_unlocked*( ), *getchar_unlocked*( ), *putc_unlocked*( ), *putchar_unlocked*( )

_POSIX_FILE_SYSTEM: File System
access( ), *chdir*( ), *closedir*( ), *creat*( ), *fpathconf*( ), *fstat*( ), *getcwd*( ), *link*( ), *mkdir*( ), *opendir*( ), *pathconf*( ), *readdir*( ), *remove*( ), *rename*( ), *rewinddir*( ), *rmdir*( ), *stat*( ), *tmpfile*( ), *tmpnam*( ), *unlink*( ), *utime*( )

853 _POSIX_JOB_CONTROL: Job Control
854 *setpgid*( ), *tcgetpgrp*( ), *tcsetpgrp*( )

855 _POSIX_MULTIPLE_PROCESS: Multiple Process
856 *_exit*( ), *assert*( ), *exit*( ), *execl*( ), *execle*( ), *execlp*( ), *execv*( ), *execve*( ), *execvp*( ), *fork*( ), *getenv*( ),
857 *getpid*( ), *getppid*( ), *setlocale*( ), *sleep*( ), *times*( ), *wait*( ), *waitpid*( )

858 _POSIX_NETWORKING: Networking
859 *accept*( ), *bind*( ), *connect*( ), *endhostent*( ), *endnetent*( ), *endprotoent*( ), *endservent*( ), *getaddrinfo*( ),
860 *gethostbyaddr*( ), *gethostbyname*( ), *gethostent*( ), *gethostname*( ), *getipnodebyaddr*( ),
861 *getipnodebyname*( ), *getnameinfo*( ), *getnetbyaddr*( ), *getnetbyname*( ), *getnetent*( ), *getpeername*( ),
862 *getprotobyname*( ), *getprotobynumber*( ), *getprotoent*( ), *getservbyname*( ), *getservbyport*( ),
863 *getservent*( ), *getsockname*( ), *getsockopt*( ), *htonl*( ), *htons*( ), *if_freenameindex*( ), *if_indextoname*( ),
864 *if_nameindex*( ), *if_nametoindex*( ), *inet_addr*( ), *inet_lnaof*( ), *inet_makeaddr*( ), *inet_netof*( ),
865 *inet_network*( ), *inet_ntoa*( ), *listen*( ), *ntohl*( ), *ntohs*( ), *recv*( ), *recvfrom*( ), *recvmsg*( ), *send*( ),
866 *sendmsg*( ), *sendto*( ), *sethostent*( ), *setnetent*( ), *setprotoent*( ), *setservent*( ), *setsockopt*( ),
867 *shutdown*( ), *socket*( ), *socketpair*( )

868 _POSIX_PIPE: Pipe
869 *pipe*( )

870 _POSIX_SIGNALS: Signal
871 *abort*( ), *alarm*( ), *kill*( ), *pause*( ), *sigaction*( ), *sigaddset*( ), *sigdelset*( ), *sigemptyset*( ), *sigfillset*( ),
872 *sigismember*( ), *siglongjmp*( ), *sigpending*( ), *sigprocmask*( ), *sigsuspend*( ), *sigsetjmp*( )

873 _POSIX_SINGLE_PROCESS: Single Process
874 *sysconf*( ), *time*( ), *uname*( )

875 _POSIX_SYSTEM_DATABASE: System Database
876 *getgrgid*( ), *getgrnam*( ), *getpwnam*( ), *getpwuid*( )

877 _POSIX_SYSTEM_DATABASE_R: Thread-Safe System Database
878 *getgrgid_r*( ), *getgrnam_r*( ), *getpwuid_r*( ), *getpwnam_r*( )

879 _POSIX_USER_GROUPS: User and Group
880 *geteuid*( ), *getegid*( ), *getgid*( ), *getgroups*( ), *getlogin*( ), *getpgrp*( ), *getuid*( ), *setgid*( ), *setsid*( ),
881 *setuid*( )

882 _POSIX_USER_GROUPS_R: Thread-Safe User and Group
883 *getlogin_r*( )

884 Many of these profiling option groups provide basic system functionality that other profiling |
885 option groups and options depend upon.[4] All of the mandatory profiling option groups (listed in |
886 Section 2.1.3.1 (on page 20)) shall be supported by an implementation conforming to |
887 IEEE Std. 1003.1-200x. If a profile of IEEE Std. 1003.1-200x does not require an implementation to |
888 provide all of the mandatory profiling option groups or does not require an implementation to |
889 provide an option or profiling option group that provides features required by another option or |
890 profiling option group,[5] the profile shall specify[6] all of the following: |

891 ——————— |

892 4. As an example, the File System profiling option group provides underlying support for path name resolution and file creation | | |
893 which are needed by any interface in IEEE Std. 1003.1-200x that parses a *path* argument. If a profile requires support for the | | |
894 Device Input and Output profiling option group but does not require support for the File System profiling option group, the | | |
895 profile must specify how path name resolution is to behave in that profile, how the O_CREAT flag to *open*( ) is to be handled (and | | |
896 the use of the character 'a' in the *mode* argument of *fopen*( ) when a file name argument names a file that does not exist), and | | |
897 specify lots of other details. | | |

898 5. As an example, IEEE Std. 1003.1-200x requires that implementations claiming to support the Range Memory Locking option also | | |
899 support the Process Memory Locking option. A profile could require that the Range Memory Locking option had to be supplied | | |
900 without requiring that the Process Memory Locking option be supplied as long as the profile specifies everything an application | | |
901 writer or system implementor would have to know to build an application or implementation conforming to the profile. | | |

- Restricted or altered behavior of interfaces defined by IEEE Std. 1003.1-200x that may differ on an implementation of the profile
- Additional behaviors that may produce undefined or unspecified results
- Additional implementation-defined behavior that implementations shall be required to document in the profile's conformance document

if any of the above is a result of the profile not providing an interface required by IEEE Std. 1003.1-200x.

2.1.5.2 XSI Option Groups

XSI The following Option Groups are defined to support the definition of XSI conformance within the System Interfaces volume of IEEE Std. 1003.1-200x:

Encryption

The Encryption Option Group is denoted by the symbolic constant _XOPEN_CRYPT. It includes the following functions:

crypt( ), *encrypt*( ), *setkey*( )

These functions are marked CRYPT.

Due to U.S. Government export restrictions on the decoding algorithm, implementations are restricted in making these functions available. All the functions in the Encryption Option Group may therefore return [ENOSYS] or, alternatively, *encrypt*( ) shall return [ENOSYS] for the decryption operation.

An implementation that claims conformance to this Option Group shall set the symbolic constant _XOPEN_CRYPT to a value other than –1.

Realtime

The Realtime Option Group is denoted by the symbolic constant _XOPEN_REALTIME.

This Option Group includes a set of realtime functions drawn from options within IEEE Std. 1003.1-200x (see Section 2.1.6 (on page 32)).

Where entire functions are included in the Option Group, the NAME section is marked with REALTIME. Where additional semantics have been added to existing pages, the new material is identified by use of the appropriate margin legend for the underlying option defined within IEEE Std. 1003.1-200x.

An implementation that claims conformance to this Option Group shall set the symbolic constant _XOPEN_REALTIME to a value other than –1.

This Option Group consists of the set of the following options from within IEEE Std. 1003.1-200x (see Section 2.1.6 (on page 32)):

---

6. Note that the profile could just specify that any use of the features not specified by the profile would produce undefined or unspecified results.

- _POSIX_ASYNCHRONOUS_IO
- _POSIX_FSYNC
- _POSIX_MAPPED_FILES
- _POSIX_MEMLOCK
- _POSIX_MEMLOCK_RANGE
- _POSIX_MEMORY_PROTECTION
- _POSIX_MESSAGE_PASSING
- _POSIX_PRIORITIZED_IO
- _POSIX_PRIORITY_SCHEDULING
- _POSIX_REALTIME_SIGNALS
- _POSIX_SEMAPHORES
- _POSIX_SHARED_MEMORY_OBJECTS
- _POSIX_SYNCHRONIZED_IO
- _POSIX_TIMERS

If the symbolic constant _XOPEN_REALTIME is defined to have a value other than −1, then the following symbolic constants shall be defined by the implementation to have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x:

- _POSIX_ASYNCHRONOUS_IO
- _POSIX_MEMLOCK
- _POSIX_MEMLOCK_RANGE
- _POSIX_MESSAGE_PASSING
- _POSIX_PRIORITY_SCHEDULING
- _POSIX_REALTIME_SIGNALS
- _POSIX_SEMAPHORES
- _POSIX_SHARED_MEMORY_OBJECTS
- _POSIX_SYNCHRONIZED_IO
- _POSIX_TIMERS

The functionality associated with _POSIX_MAPPED_FILES, _POSIX_MEMORY_PROTECTION, and _POSIX_FSYNC is always supported on XSI-conformant systems.

Support of _POSIX_PRIORITIZED_IO on XSI-conformant systems is optional. If this functionality is supported, then _POSIX_PRIORITIZED_IO shall be set to a value other than −1. Otherwise, it shall be undefined.

If _POSIX_PRIORITIZED_IO is supported, then asynchronous I/O operations performed by *aio_read*(), *aio_write*(), and *lio_listio*() shall be submitted at a priority equal to the scheduling priority of the process minus *aiocbp->aio_reqprio*. The implementation shall also document for which files I/O prioritization is supported.

Advanced Realtime

An implementation that claims conformance to this Option Group shall also support the Realtime Option Group.

Where entire functions are included in the Option Group, the NAME section is marked with ADVANCED REALTIME. Where additional semantics have been added to existing pages, the new material is identified by use of the appropriate margin legend for the underlying option defined within IEEE Std. 1003.1-200x.

This Option Group consists of the set of the following options from within IEEE Std. 1003.1-200x (see Section 2.1.6 (on page 32)):

- _POSIX_ADVISORY_INFO
- _POSIX_CLOCK_SELECTION
- _POSIX_CPUTIME
- _POSIX_MONOTONIC_CLOCK
- _POSIX_SPAWN
- _POSIX_SPORADIC_SERVER
- _POSIX_TIMEOUTS
- _POSIX_TYPED_MEMORY_OBJECTS

If the implementation supports the Advanced Realtime Option Group, then the following symbolic constants shall be defined by the implementation to have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x:

- _POSIX_ADVISORY_INFO
- _POSIX_CLOCK_SELECTION
- _POSIX_CPUTIME
- _POSIX_MONOTONIC_CLOCK
- _POSIX_SPAWN
- _POSIX_SPORADIC_SERVER
- _POSIX_TIMEOUTS
- _POSIX_TYPED_MEMORY_OBJECTS

If the symbolic constant _POSIX_SPORADIC_SERVER is defined, then the symbolic constant _POSIX_PRIORITY_SCHEDULING shall also be defined by the implementation to have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

If the symbolic constant _POSIX_CPUTIME is defined, then the symbolic constant _POSIX_TIMERS shall also be defined by the implementation to have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

If the symbolic constant _POSIX_MONOTONIC_CLOCK is defined, then the symbolic constant _POSIX_TIMERS shall also be defined by the implementation to have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

If the symbolic constant _POSIX_CLOCK_SELECTION is defined, then the symbolic constant _POSIX_TIMERS shall also be defined by the implementation to have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

Realtime Threads

The Realtime Threads Option Group is denoted by the symbolic constant _XOPEN_REALTIME_THREADS.

This Option Group consists of the set of the following options from within IEEE Std. 1003.1-200x (see Section 2.1.6 (on page 32)):

- _POSIX_THREAD_PRIO_INHERIT
- _POSIX_THREAD_PRIO_PROTECT
- _POSIX_THREAD_PRIORITY_SCHEDULING

Where applicable, whole pages are marked REALTIME THREADS, together with the appropriate option margin legend for the SYNOPSIS section (see Section 1.5.1 (on page 10)).

An implementation that claims conformance to this Option Group shall set _XOPEN_REALTIME_THREADS to a value other than –1.

If the symbol _XOPEN_REALTIME_THREADS is defined to have a value other than –1, then the symbols shall also be defined by the implementation to have the value 200ymmL, the date of

approval of IEEE Std. 1003.1-200x:

- _POSIX_THREAD_PRIO_INHERIT
- _POSIX_THREAD_PRIO_PROTECT
- _POSIX_THREAD_PRIORITY_SCHEDULING

Advanced Realtime Threads

An implementation that claims conformance to this Option Group shall also support the Realtime Threads Option Group.

Where entire functions are included in the Option Group, the NAME section is marked with ADVANCED REALTIME THREADS. Where additional semantics have been added to existing pages, the new material is identified by use of the appropriate margin legend for the underlying option defined within IEEE Std. 1003.1-200x.

This Option Group consists of the set of the following options from within IEEE Std. 1003.1-200x (see Section 2.1.6 (on page 32)):

- _POSIX_BARRIERS
- _POSIX_SPIN_LOCKS
- _POSIX_THREAD_CPUTIME
- _POSIX_THREAD_SPORADIC_SERVER

If the symbolic constant _POSIX_THREAD_SPORADIC_SERVER is defined, then the symbolic constant _POSIX_THREAD_PRIORITY_SCHEDULING shall also be defined by the implementation to have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

If the symbolic constant _POSIX_THREAD_CPUTIME is defined, then the symbolic constant _POSIX_TIMERS shall also be defined by the implementation to have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

If the symbolic constant _POSIX_BARRIERS is defined, then the symbolic constants _POSIX_THREADS and _POSIX_THREAD_SAFE_FUNCTIONS shall also be defined by the implementation to have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

If the symbolic constant _POSIX_SPIN_LOCKS is defined, then the symbolic constants _POSIX_THREADS and _POSIX_THREAD_SAFE_FUNCTIONS shall also be defined by the implementation to have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

If the implementation supports the Advanced Realtime Threads Option Group, then the following symbolic constants shall be defined by the implementation to have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x:

- _POSIX_BARRIERS
- _POSIX_SPIN_LOCKS
- _POSIX_THREAD_CPUTIME
- _POSIX_THREAD_SPORADIC_SERVER

Tracing

This Option Group includes a set of tracing functions drawn from options within IEEE Std. 1003.1-200x (see Section 2.1.6 (on page 32)).

Where entire functions are included in the Option Group, the NAME section is marked with TRACING. Where additional semantics have been added to existing pages, the new material is identified by use of the appropriate margin legend for the underlying option defined within IEEE Std. 1003.1-200x.

This Option Group consists of the set of the following options from within IEEE Std. 1003.1-200x (see Section 2.1.6 (on page 32)):

- _POSIX_TRACE
- _POSIX_TRACE_EVENT_FILTER
- _POSIX_TRACE_LOG
- _POSIX_TRACE_INHERIT

If the implementation supports the Tracing Option Group, then the following symbolic constants shall be defined by the implementation to have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x:

- _POSIX_TRACE
- _POSIX_TRACE_EVENT_FILTER
- _POSIX_TRACE_LOG
- _POSIX_TRACE_INHERIT

XSI STREAMS

The XSI STREAMS Option Group is denoted by the symbolic constant _XOPEN_STREAMS.

This Option Group includes functionality related to STREAMS, a uniform mechanism for implementing networking services and other character-based I/O as described in the System Interfaces volume of IEEE Std. 1003.1-200x, Section 2.6, STREAMS.

It includes the following functions:

fattach( ), *fdetach*( ), *getmsg*( ), *ioctl*( ), *isastream*( ), *putmsg*( ), *putpmsg*( )

and the **<stropts.h>** header.

Where applicable, whole pages are marked STREAMS, together with the appropriate option margin legend for the SYNOPSIS section (see Section 1.5.1 (on page 10)). Where additional semantics have been added to existing pages, the new material is identified by use of the appropriate margin legend for the underlying option defined within IEEE Std. 1003.1-200x.

Legacy

The Legacy Option Group is denoted by the symbolic constant _XOPEN_LEGACY.

The Legacy Option Group includes the functions and headers which were mandatory in previous versions of IEEE Std. 1003.1-200x but are optional in this version.

These functions and headers are retained in IEEE Std. 1003.1-200x because of their widespread use. Application writers should not rely on the existence of these functions or headers in new applications, but should follow the migration path detailed in the APPLICATION USAGE sections of the relevant pages.

Various factors may have contributed to the decision to mark a function or header LEGACY. In all cases, the specific reasons for the withdrawal of a function or header are documented on the

relevant pages.

Once a function or header is marked LEGACY, no modifications are made to the specifications of such functions or headers other than to the APPLICATION USAGE sections of the relevant pages.

The functions and headers which form this Option Group are as follows:

bcmp( ), *bcopy*( ), *bzero*( ), *ecvt*( ), *fcvt*( ), *ftime*( ), *gcvt*( ), *getwd*( ), *index*( ), *mktemp*( ), *rindex*( ), *utimes*( )

An implementation that claims conformance to this Option Group shall set the macro _XOPEN_LEGACY to a value other than –1.

2.1.6 Options

The following symbolic constants reflect implementation options for IEEE Std. 1003.1-200x. These symbols can be used by the application to determine which optional facilities are present on the implementation. The *sysconf*( ) function defined in the System Interfaces volume of IEEE Std. 1003.1-200x or the *getconf* utility defined in the Shell and Utilities volume of IEEE Std. 1003.1-200x can be used to retrieve the value of each symbol on each specific implementation.

Where an option is not supported, the associated utilities, functions, or facilities need not be present.

Margin codes are defined for each option (see Section 1.5.1 (on page 10)).

2.1.6.1 System Interfaces

ADV _POSIX_ADVISORY_INFO
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Advisory Information option.

AIO _POSIX_ASYNCHRONOUS_IO
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Asynchronous Input and Output option.

BAR _POSIX_BARRIERS
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Barriers option.

CS _POSIX_CLOCK_SELECTION
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Clock Selection option.

CPT _POSIX_CPUTIME
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Process CPU-Time Clocks option.

FSC _POSIX_FSYNC
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the File Synchronization option.

IP6 _POSIX_IPV6
If this symbol is defined, then the implementation supports the functions and additional semantics in the IPV6 option.

MF _POSIX_MAPPED_FILES
If this symbolic constant is defined, then the implementation supports the functions and

additional semantics in the Memory Mapped Files option.

ML _POSIX_MEMLOCK
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Process Memory Locking option.

MLR _POSIX_MEMLOCK_RANGE
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Range Memory Locking option.

MPR _POSIX_MEMORY_PROTECTION
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Memory Protection option.

MSG _POSIX_MESSAGE_PASSING
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Message Passing option.

MON _POSIX_MONOTONIC_CLOCK
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Monotonic Clock option.

PIO _POSIX_PRIORITIZED_IO
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Prioritized Input and Output option.

PS _POSIX_PRIORITY_SCHEDULING
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Process Scheduling option.

RTS _POSIX_REALTIME_SIGNALS
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Realtime Signals Extension option.

SEM _POSIX_SEMAPHORES
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Semaphores option.

SHM _POSIX_SHARED_MEMORY_OBJECTS
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Shared Memory Objects option.

SH _POSIX_SHELL
If this symbolic constant is defined, then the implementation supports the *sh* utility command line interpretor specified by the Shell and Utilities volume of IEEE Std. 1003.1-200x.

SPN _POSIX_SPAWN
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Spawn option.

SPI _POSIX_SPIN_LOCKS
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Spin Locks option.

SS _POSIX_SPORADIC_SERVER
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Process Sporadic Server option.

SIO _POSIX_SYNCHRONIZED_IO
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Synchronized Input and Output option.

TSA _POSIX_THREAD_ATTR_STACKADDR
If this symbolic constant is defined, then the implementation supports the additional semantics in the Thread Stack Address Attribute option.

TSS _POSIX_THREAD_ATTR_STACKSIZE
If this symbolic constant is defined, then the implementation supports the additional semantics in the Thread Stack Address Size option.

TCT _POSIX_THREAD_CPUTIME
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Thread CPU-Time Clocks option.

TPI _POSIX_THREAD_PRIO_INHERIT
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Threads Priority Inheritance option.

TPP _POSIX_THREAD_PRIO_PROTECT
If this symbolic constant is defined, then the implementation supports the additional semantics in the Thread Priority Protection option.

TPS _POSIX_THREAD_PRIORITY_SCHEDULING
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Thread Execution Scheduling option.

TSH _POSIX_THREAD_PROCESS_SHARED
If this symbolic constant is defined, then the implementation supports the additional semantics in the Thread Process-Shared Synchronization option.

TSF _POSIX_THREAD_SAFE_FUNCTIONS
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Thread-Safe Functions option.

TSP _POSIX_THREAD_SPORADIC_SERVER
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Thread Sporadic Server option.

THR _POSIX_THREADS
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Threads option.

TMO _POSIX_TIMEOUTS
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Timeouts option.

TMR _POSIX_TIMERS
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Timers option.

TRC _POSIX_TRACE
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Trace option.

TEF _POSIX_TRACE_EVENT_FILTER
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Trace Event Filter option.

TRL _POSIX_TRACE_LOG
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Trace Log option.

TRI _POSIX_TRACE_INHERIT
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Trace Inherit option.

TYM _POSIX_TYPED_MEMORY_OBJECTS
If this symbolic constant is defined, then the implementation supports the functions and additional semantics in the Typed Memory Objects option.

2.1.6.2 Shell and Utilities

Each of these symbols shall be considered valid names by the implementation. Each shall be defined on the system with a value of 1 if the corresponding option is supported; otherwise, the symbol shall be undefined.

The literal names shown below apply only to the *getconf* utility.

CD POSIX2_C_DEV
The system supports the C-Language Development Utilities option.

The utilities in the C-Language Development Utilities option are used for the development of C-language applications, including compilation or translation of C source code and complex program generators for simple lexical tasks and processing of context-free grammars.

The utilities listed below may be provided by a conforming system; however, any system claiming conformance to the C-Language Development Utilities option shall provide all of the utilities listed.

c99
lex
yacc

POSIX2_CHAR_TERM
The system supports the Terminal Characteristics option. This value need not be present on a system not supporting the User Portability Utilities option.

Where applicable, the dependency is noted within the description of the utility.

This option applies only to systems supporting the User Portability Utilities option. If supported, then the system supports at least one terminal type capable of all operations described in IEEE Std. 1003.1-200x; see Section 10.2 (on page 211).

FD POSIX2_FORT_DEV
The system supports the FORTRAN Development Utilities option.

The *fort77* FORTRAN compiler is the only utility in the FORTRAN Development Utilities option. This is used for the development of FORTRAN language applications, including compilation or translation of FORTRAN source code.

The *fort77* utility may be provided by a conforming system; however, any system claiming conformance to the FORTRAN Development Utilities option shall provide the *fort77* utility.

FR POSIX2_FORT_RUN
The system supports the FORTRAN Runtime Utilities option.

The *asa* utility is the only utility in the FORTRAN Runtime Utilities option.

The *asa* utility may be provided by a conforming system; however, any system claiming conformance to the FORTRAN Runtime Utilities option shall provide the *asa* utility.

POSIX2_LOCALEDEF

The system supports the Locale Creation Utilities option.

If supported, the system supports the creation of locales as described in the *localedef* utility.

The *localedef* utility may be provided by a conforming system; however, any system claiming conformance to the Locale Creation Utilities option shall provide the *localedef* utility.

BE POSIX2_PBS

The system supports the Batch Environment Services and Utilities option (see the Shell and Utilities volume of IEEE Std. 1003.1-200x, Chapter 3, Batch Environment Services).

Note: The Batch Environment Services and Utilities option is a combination of mandatory and optional batch services and utilities. The POSIX_PBS symbolic constant implies the system supports all the mandatory batch services and utilities.

POSIX2_PBS_ACCOUNTING

The system supports the Batch Accounting option.

POSIX2_PBS_CHECKPOINT

The system supports the Batch Checkpoint/Restart option.

POSIX2_PBS_LOCATE

The system supports the Locate Batch Job Request option.

POSIX2_PBS_MESSAGE

The system supports the Batch Job Message Request option.

POSIX2_PBS_TRACK

The system supports the Track Batch Job Request option.

SD POSIX2_SW_DEV

The system supports the Software Development Utilities option.

The utilities in the Software Development Utilities option are used for the development of applications, including compilation or translation of source code, the creation and maintenance of library archives, and the maintenance of groups of inter-dependent programs.

The utilities listed below may be provided by the conforming system; however, any system claiming conformance to the Software Development Utilities option shall provide all of the utilities listed here.

ar
make
nm
strip

UP POSIX2_UPE

The system supports the User Portability Utilities option.

The utilities in the User Portability Utilities option shall be implemented on all systems that claim conformance to this option. Certain utilities are noted as having features that cannot be implemented on all terminal types; if the POSIX2_CHAR_TERM option is supported, the

system shall support all such features on at least one terminal type; see Section 10.2 (on page 211).

Some of the utilities are required only on systems that also support the Software Development Utilities option, or the character-at-a-time terminal option (see Section 10.2 (on page 211)); such utilities have this noted in their DESCRIPTION sections. All of the other utilities listed are required only on systems that claim conformance to the User Portability Utilities option.

2.2 Application Conformance

All applications claiming conformance to IEEE Std. 1003.1-200x shall use only language-dependent services for the C programming language described in Section 2.3 (on page 40), shall use only the utilities and facilities defined in the Shell and Utilities volume of IEEE Std. 1003.1-200x, and shall fall within one of the following categories.

2.2.1 Strictly Conforming POSIX Application

A Strictly Conforming POSIX Application is an application that requires only the facilities described in IEEE Std. 1003.1-200x. Such an application:

1. Shall accept any implementation behavior that results from actions it takes in areas described in IEEE Std. 1003.1-200x as *implementation-defined* or *unspecified*, or where IEEE Std. 1003.1-200x indicates that implementations may vary
2. Shall not perform any actions that are described as producing *undefined* results
3. For symbolic constants, shall accept any value in the range permitted by IEEE Std. 1003.1-200x, but shall not rely on any value in the range being greater than the minimums listed or being less than the maximums listed in IEEE Std. 1003.1-200x
4. Shall not use facilities designated as *obsolescent*
5. Is required to tolerate and permitted to adapt to the presence or absence of optional facilities whose availability is indicated by Section 2.1.3 (on page 20)
6. For the C programming language, shall not produce any output dependent on any behavior described in the ISO C standard as *unspecified*, *undefined*, or *implementation-defined*, unless the System Interfaces volume of IEEE Std. 1003.1-200x specifies the behavior
7. For the C programming language, shall not exceed any minimum implementation limit defined in the ISO C standard, unless the System Interfaces volume of IEEE Std. 1003.1-200x specifies a higher minimum implementation limit
8. For the C programming language, shall define _POSIX_C_SOURCE to be 200xxxL before any header is included

Within IEEE Std. 1003.1-200x, any restrictions placed upon a Conforming POSIX Application shall restrict a Strictly Conforming POSIX Application.

2.2.2 Conforming POSIX Application

2.2.2.1 ISO/IEC Conforming POSIX Application

An ISO/IEC Conforming POSIX Application is an application that uses only the facilities described in IEEE Std. 1003.1-200x and approved Conforming Language bindings for any ISO or IEC standard. Such an application shall include a statement of conformance that documents all options and limit dependencies, and all other ISO or IEC standards used.

2.2.2.2 <National Body> Conforming POSIX Application

A <National Body> Conforming POSIX Application differs from an ISO/IEC Conforming POSIX Application in that it also may use specific standards of a single ISO/IEC member body referred to here as *<National Body>*. Such an application shall include a statement of conformance that documents all options and limit dependencies, and all other <National Body> standards used.

2.2.3 Conforming POSIX Application Using Extensions

A Conforming POSIX Application Using Extensions is an application that differs from a Conforming POSIX Application only in that it uses non-standard facilities that are consistent with IEEE Std. 1003.1-200x. Such an application shall fully document its requirements for these extended facilities, in addition to the documentation required of a Conforming POSIX Application. A Conforming POSIX Application Using Extensions shall be either an ISO/IEC Conforming POSIX Application Using Extensions or a <National Body> Conforming POSIX Application Using Extensions (see Section 2.2.2.1 (on page 38) and Section 2.2.2.2 (on page 38)).

2.2.4 Strictly Conforming XSI Application

A Strictly Conforming XSI Application is an application that requires only the facilities described in IEEE Std. 1003.1-200x. Such an application:

1. Shall accept any implementation behavior that results from actions it takes in areas described in IEEE Std. 1003.1-200x as *implementation-defined* or *unspecified*, or where IEEE Std. 1003.1-200x indicates that implementations may vary
2. Shall not perform any actions that are described as producing *undefined* results
3. For symbolic constants, shall accept any value in the range permitted by IEEE Std. 1003.1-200x, but shall not rely on any value in the range being greater than the minimums listed or being less than the maximums listed
4. Shall not use facilities designated as *obsolescent*
5. Is required to tolerate and permitted to adapt to the presence or absence of optional facilities whose availability is indicated by Section 2.1.4 (on page 23)
6. For the C programming language, shall not produce any output dependent on any behavior described in the ISO C standard as *unspecified*, *undefined*, or *implementation-defined*, unless the System Interfaces volume of IEEE Std. 1003.1-200x specifies the behavior
7. For the C programming language, shall not exceed any minimum implementation limit defined in the ISO C standard, unless the System Interfaces volume of IEEE Std. 1003.1-200x specifies a higher minimum implementation limit
8. For the C programming language, shall define _XOPEN_SOURCE to be 600 before any header is included

Within IEEE Std. 1003.1-200x, any restrictions placed upon a Conforming POSIX Application shall restrict a Strictly Conforming XSI Application.

2.2.5 Conforming XSI Application Using Extensions

A Conforming XSI Application Using Extensions is an application that differs from a Strictly Conforming XSI Application only in that it uses non-standard facilities that are consistent with IEEE Std. 1003.1-200x. Such an application shall fully document its requirements for these extended facilities, in addition to the documentation required of a Strictly Conforming XSI Application.

2.3 Language-Dependent Services for the C Programming Language

Implementors seeking to claim conformance using the ISO C standard shall claim POSIX conformance as described in Section 2.1.3 (on page 20), C Language Binding (C Standard Language-Dependent System Support).

2.4 Other Language-Related Specifications

IEEE Std. 1003.1-200x is currently specified in terms of the shell command language and ISO C. Bindings to other programming languages are being developed.

If conformance to IEEE Std. 1003.1-200x is claimed for implementation of any programming language, the implementation of that language shall support the use of external symbols distinct to at least 31 bytes in length in the source program text. (That is, identifiers that differ at or before the thirty-first byte shall be distinct.) If a national or international standard governing a language defines a maximum length that is less than this value, the language-defined maximum shall be supported. External symbols that differ only by case shall be distinct when the character set in use distinguishes uppercase and lowercase characters and the language permits (or requires) uppercase and lowercase characters to be distinct in external symbols.

1433 *Chapter 3*

Definitions

1434 3.1 Abortive Release

1435 An abrupt termination of a network connection that may result in the loss of data.

1436 3.2 Absolute Path Name

1437 A path name beginning with a single or more than two slashes; see also Section 3.268 (on page
1438 86).

1439 **Note:** Path Name Resolution is defined in detail in Section 4.9 (on page 123).

1440 3.3 Access Mode

1441 A particular form of access permitted to a file.

1442 3.4 Additional File Access Control Mechanism

1443 An implementation-defined mechanism that is layered upon the access control mechanisms |
1444 defined here, but which do not grant permissions beyond those defined herein, although they |
1445 may further restrict them. |

1446 **Note:** File Access Permissions are defined in detail in Section 4.3 (on page 121).

1447 3.5 Address Space

1448 The memory locations that can be referenced by a process or the threads of a process.

1449 3.6 Advisory Information

1450 An interface that advises the implementation on (portable) application behavior so that it can |
1451 optimize the system. |

3.7 Affirmative Response

An input string that matches one of the responses acceptable to the *LC_MESSAGES* category keyword **yesexpr**, matching an extended regular expression in the current locale.

Note: The *LC_MESSAGES* category is defined in detail in Section 7.3.6 (on page 174).

3.8 Alert

To cause the user's terminal to give some audible or visual indication that an error or some other event has occurred. When the standard output is directed to a terminal device, the method for alerting the terminal user is unspecified. When the standard output is not directed to a terminal device, the alert is accomplished by writing the <alert> character to standard output (unless the utility description indicates that the use of standard output produces undefined results in this case).

3.9 Alert Character (<alert>)

A character that in the output stream should cause a terminal to alert its user via a visual or audible notification. The <alert> character is the character designated by `'\a'` in the C language. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the alert function.

3.10 Alias Name

In the shell command language, a word consisting solely of underscores, digits, and alphabetics from the portable character set and any of the following characters: `'!'`, `'%'`, `','`, `'@'`.

Implementations may allow other characters within alias names as an extension.

Note: The Portable Character Set is defined in detail in Section 6.1 (on page 133).

3.11 Alignment

A requirement that objects of a particular type be located on storage boundaries with addresses that are particular multiples of a byte address

Note: See also the ISO C standard, § B3.

3.12 Alternate File Access Control Mechanism

An implementation-defined mechanism that is independent of the access control mechanisms defined herein, and which if enabled on a file may either restrict or extend the permissions of a given user. IEEE Std. 1003.1-200x defines when such mechanisms can be enabled and when they are disabled.

Note: File Access Permissions are defined in detail in Section 4.3 (on page 121).

3.13 Alternate Signal Stack

Memory associated with a thread, established upon request by the implementation for a thread, separate from the thread signal stack, in which signal handlers responding to signals sent to that thread may be executed.

3.14 Ancillary Data

Protocol-specific, local system-specific, or optional information. The information can be both local or end-to-end significant, header information, part of a data portion, protocol-specific, and implementation or system-specific.

3.15 Angle Brackets

The characters '<' (left-angle-bracket) and '>' (right-angle-bracket). When used in the phrase ''enclosed in angle brackets'', the symbol '<' immediately precedes the object to be enclosed, and '>' immediately follows it. When describing these characters in the portable character set, the names <less-than-sign> and <greater-than-sign> are used.

3.16 Application

A computer program that performs some desired function.

3.17 Application Address

Endpoint address of a specific application.

3.18 Application Program Interface (API)

The definition of syntax and semantics for providing computer system services.

3.19 Appropriate Privileges

An implementation-defined means of associating privileges with a process with regard to the function calls, function call options, and the commands that need special privileges. There may be zero or more such means. These means (or lack thereof) are described in the conformance document.

Note: Function calls are defined in the System Interfaces volume of IEEE Std. 1003.1-200x, and commands are defined in the Shell and Utilities volume of IEEE Std. 1003.1-200x.

3.20 Argument

In the shell command language, a parameter passed to a utility as the equivalent of a single string in the *argv* array created by one of the *exec* functions. An argument is one of the options, option-arguments, or operands following the command name.

Note: The Utility Argument Syntax is defined in detail in Section 12.1 (on page 227) and the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.9.1.1, Command Search and Execution.

In the C language, an expression in a function call expression or a sequence of preprocessing tokens in a function-like macro invocation.

3.21 Arm (a Timer)

To start a timer measuring the passage of time, enabling notifying a process when the specified time or time interval has passed.

3.22 Assignment

NEW DEF REQUIRED.

Note: Variable Assignment is defined in detail in Section 4.16 (on page 127).

3.23 Asterisk

The character '*'.

3.24 Async-Cancel-Safe Function

A function that may be safely invoked by an application while the asynchronous form of cancelation is enabled. No function is async-cancel-safe unless explicitly described as such.

3.25 Asynchronous Events

Events that occur independently of the execution of the application.

3.26 Asynchronous Input and Output

A functionality enhancement to allow an application process to queue data input and output commands with asynchronous notification of completion. This facility includes in its scope the requirements of supercomputer applications.

3.27 Async-Signal-Safe Function

A function that may be invoked, without restriction, from signal-catching functions. No function is async-signal-safe unless explicitly described as such.

3.28 Asynchronously-Generated Signal

A signal that is not attributable to a specific thread. Examples are signals sent via *kill*(), signals sent from the keyboard, and signals delivered to process groups. Being asynchronous is a property of how the signal was generated and not a property of the signal number. All signals may be generated asynchronously.

Note: The *kill*() function is defined in detail in the System Interfaces volume of IEEE Std. 1003.1-200x.

3.29 Asynchronous I/O Operation

An I/O operation that does not of itself cause the thread requesting the I/O to be blocked from further use of the processor.

This implies that the process and the I/O operation may be running concurrently.

3.30 Asynchronous I/O Completion

For an asynchronous read or write operation, when a corresponding synchronous read or write would have completed and when any associated status fields have been updated.

3.31 Authentication

The process of validating a user or process to verify that the user or process is not a counterfeit.

3.32 Authorization

The process of verifying that a user or process has permission to use a resource in the manner requested.

To ensure security, the user or process would also need to be authenticated before granting access.

3.33 Background Job

See *Background Process Group* in Section 3.35.

3.34 Background Process

A process that is a member of a background process group.

3.35 Background Process Group (or Background Job)

Any process group, other than a foreground process group, that is a member of a session that has established a connection with a controlling terminal.

3.36 Backquote

The character '`', also known as a *grave accent*.

3.37 Backslash

The character '\', also known as a *reverse solidus*.

3.38 Backspace Character (<backspace>)

A character that, in the output stream, should cause printing (or displaying) to occur one column position previous to the position about to be printed. If the position about to be printed is at the beginning of the current line, the behavior is unspecified. The <backspace> character is the character designated by '\b' in the C language. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the backspace function. The <backspace> character defined here is not necessarily the ERASE special character.

Note: Special Characters are defined in detail in Section 11.1.9 (on page 217).

3.39 Barrier

A synchronization object that allows multiple threads to synchronize at a particular point in their execution.

3.40 Base Character

One of the set of characters defined in the Latin alphabet. In Western European languages other than English, these characters are commonly used with diacritical marks (accents, cedilla, and so on) to extend the range of characters in an alphabet.

3.41 Basename

The final, or only, file name in a path name.

3.42 Basic Regular Expression (BRE)

A regular expression (see Section 3.318 (on page 95)) used by the majority of utilities that select strings from a set of character strings.

Note: Basic Regular Expressions are described in detail in Section 9.3 (on page 198).

3.43 Batch Access List

A list of user IDs and group IDs of those users and groups authorized to place batch jobs in a batch queue.

A batch access list is associated with a batch queue. A batch server uses the batch access list of a batch queue as one of the criteria in deciding to put a batch job in a batch queue.

3.44 Batch Administrator

A person who is authorized to use all restricted batch services.

3.45 Batch Client

A computational entity that utilizes batch services by making requests of batch servers.

Batch clients often provide the means by which users access batch services, although a batch server may act as a batch client by virtue of making requests of another batch server.

3.46 Batch Destination

The batch server in a batch system to which a batch job should be sent for processing.

Acceptance of a batch job at a batch destination is the responsibility of a receiving batch server. A batch destination may consist of a batch server-specific portion, a network-wide portion, or both. The batch server-specific portion is referred to as the *batch queue*. The network-wide portion is referred to as a *batch server name*.

3.47 Batch Destination Identifier

A string that identifies a specific batch destination.

A string of characters in the portable character set used to specify a particular batch destination.

Note: The Portable Character Set is defined in detail in Section 6.1 (on page 133).

3.48 Batch Directive

A line from a file that is interpreted by the batch server. The line is usually in the form of a comment and is an additional means of passing options to the *qsub* utility.

Note: The *qsub* utility is defined in detail in the Shell and Utilities volume of IEEE Std. 1003.1-200x.

3.49 Batch Job

A set of computational tasks for a computing system.

Batch jobs are managed by batch servers.

Once created, a batch job may be executing or pending execution. A batch job that is executing has an associated session leader (a process) that initiates and monitors the computational tasks of the batch job.

3.50 Batch Job Attribute

A named data type whose value affects the processing of a batch job.

The values of the attributes of a batch job affect the processing of that job by the batch server that manages the batch job.

The attributes defined for a batch job are called the batch job attributes.

3.51 Batch Job Identifier

A unique name for a batch job. A name that is unique among all other batch job identifiers in a batch system and that identifies the batch server to which the batch job was originally submitted.

3.52 Batch Job Name

A label that is an attribute of a batch job. The batch job name is not necessarily unique.

3.53 Batch Job Owner

The *username@hostname* of the user submitting the batch job, where *username* is a user name (see also Section 3.428 (on page 115)) and *hostname* is a network host name.

3.54 Batch Job Priority

An attribute used in selecting a batch job for execution.

A value specified by the user that may be used by an implementation to determine the order in which batch jobs are selected to be executed. Job priority has a numeric value in the range –1 024 to 1 023.

Note: The batch job priority is not the execution priority (nice value) of the batch job.

3.55 Batch Job State

An attribute of a batch job.

The state of a batch job determines the types of requests that the batch server that manages the batch job can accept for the batch job. Valid states include QUEUED, RUNNING, HELD, WAITING, EXITING, and TRANSITING.

3.56 Batch Name Service

A service that assigns batch names that are unique within the batch name space, and that can translate a unique batch name into the location of the named batch entity.

3.57 Batch Name Space

The environment within which a batch name is known to be unique.

3.58 Batch Node

A host containing part or all of a batch system.

A batch node is a host meeting at least one of the following conditions:

- Capable of executing a batch client
- Contains a routing batch queue
- Contains an execution batch queue

3.59 Batch Operator

A person who is authorized to use some, but not all, restricted batch services.

3.60 Batch Queue

A manageable object that represents a set of batch jobs and is managed by a single batch server.

Note: Each batch job managed by a batch server is a member of a single batch queue managed by that server.

Such a set of batch jobs is called a batch queue largely for historical reasons. Jobs are selected from the batch queue for execution based on attributes such as priority, resource requirements, and hold conditions.

Two types of batch queue are described in IEEE Std. 1003.1-200x: *routing batch queues* and *execution batch queues.*

3.61 Batch Queue Attribute

A named data type whose value affects the processing of all batch jobs that are members of the batch queue.

A batch queue has attributes that affect the processing of batch jobs that are members of the batch queue.

The attributes defined for a batch queue are called the batch batch queue attributes.

3.62 Batch Queue Position

The place a batch job occupies in a batch queue.

This place is relative to other batch jobs in the batch queue and defined in part by submission time and its priority; see also Section 3.63.

3.63 Batch Queue Priority

The maximum job priority allowed for any batch job in a given batch queue.

The batch queue priority is set and may be changed by users with appropriate privilege. The priority is bounded in an implementation-defined manner.

3.64 Batch Rerunability

An attribute of a batch job.

If a batch job may be rerun from the beginning after an abnormal termination without affecting the validity of the results, the batch job is said to be rerunable.

3.65 Batch Restart

Resume the processing of a batch job from the point of the last checkpoint. Typically, this is done if the batch job has been interrupted because of a system failure.

3.66 Batch Server

A computational entity that provides batch services.

3.67 Batch Server Name

A string that identifies a specific server in a network.

A string of characters in the portable character set used to specify a particular server in a network.

Note: The Portable Character Set is defined in detail in Section 6.1 (on page 133).

3.68 Batch Service

Computational and organizational services performed by a batch system on behalf of batch jobs.

Batch services are of two types: *requested* and *deferred*.

Note: Batch Services are listed in the Shell and Utilities volume of IEEE Std. 1003.1-200x, Table 3-5, Batch Services Summary.

3.69 Batch Service Request

A solicitation of services from a batch client to a batch server.

A batch service request may entail the exchange of any number of messages between the batch client and the batch server.

When naming specific types of service requests, the term request is qualified by the type of request, as in *Queue Batch Job Request* and *Delete Batch Job Request*.

3.70 Batch Submission

The process by which a batch client requests that a batch server create a batch job via a *Queue Job Request* to perform a specified computational task.

3.71 Batch System

A collection of one or more batch servers.

3.72 Batch Target User

The name of a user on the batch destination batch server.

The target user is the user name under whose account the batch job is to execute on the destination batch server.

3.73 Batch User

A person who is authorized to make use of batch services.

3.74 Bind

Assign a network address to an endpoint.

3.75 Blank Character (<blank>)

One of the characters that belong to the **blank** character class as defined via the *LC_CTYPE* category in the current locale. In the POSIX locale, a <blank> character is either a <tab> or a <space> character.

3.76 Blank Line

A line consisting solely of zero or more <blank> characters terminated by a <newline> character; see also Section 3.146 (on page 66).

3.77 Blocked Process (or Thread)

A process (or thread) that is waiting for some condition (other than the availability of a processor) to be satisfied before it can continue execution.

3.78 Blocking

Executing with O_NONBLOCK not set; see also Section 3.242 (on page 82).

3.79 Block-Mode Terminal

A terminal device operating in a mode incapable of the character-at-a-time input and output operations described by some of the standard utilities.

Note: Output Devices and Terminal Types are defined in detail in Section 10.2 (on page 211).

3.80 Block Special File

A file that refers to a device. A block special file is normally distinguished from a character special file by providing access to the device in a manner such that the hardware characteristics of the device are not visible.

3.81 Braces

The characters '{' (left brace) and '}' (right brace), also known as *curly braces*. When used in the phrase ''enclosed in (curly) braces'' the symbol '{' immediately precedes the object to be enclosed, and '}' immediately follows it. When describing these characters in the portable character set, the names <left-brace> and <right-brace> are used.

3.82 Brackets

The characters '[' (left-bracket) and ']' (right-bracket), also known as *square brackets*. When used in the phrase ''enclosed in (square) brackets'' the symbol '[' immediately precedes the object to be enclosed, and ']' immediately follows it. When describing these characters in the portable character set, the names <left-square-bracket> and <right-square-bracket> are used.

3.83 Break Value

The address at which dynamic memory allocation starts.

3.84 Broadcast

The transfer of data from one endpoint to several endpoints, as described in RFC 919 and RFC 922.

3.85 Built-In Utility (or Built-In)

A utility implemented within a shell. The utilities referred to as *special built-ins* have special qualities. Unless qualified, the term built-in includes the special built-in utilities. *Regular built-ins* are not required to be actually built into the shell on the implementation, but they do have special command-search qualities.

Note: Special Built-In Utilities are defined in detail in the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.15, Special Built-In Utilities.

Regular Built-In Utilities are defined in detail in the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.9.1.1, Command Search and Execution.

3.86 Byte

An individually addressable unit of data storage that is equal to or larger than an octet, used to store a character or a portion of a character; see also Section 3.89 (on page 56). A byte is composed of a contiguous sequence of bits, the number of which is implementation-defined. The least significant bit is called the *low-order* bit; the most significant is called the *high-order* bit.

Note: The definition of *byte* is actually from the ISO C standard. It has been reworded slightly to clarify its intent without introducing the ISO C standard terminology ‘‘basic execution character set’’, which is inapplicable to IEEE Std. 1003.1-200x. It deviates intentionally from the usage of *byte* in some international standards, where it is used as a synonym for *octet* (always eight bits). A byte may be larger than eight bits so that it can be an integral portion of larger data objects that are not evenly divisible by eight bits (such as a 36-bit word that contains four 9-bit bytes).

3.87 Byte Input/Output Functions

The functions that perform byte-oriented input from streams or byte-oriented output to streams: *fgetc*( ), *fgets*( ), *fprintf*( ), *fputc*( ), *fputs*( ), *fread*( ), *fscanf*( ), *fwrite*( ), *getc*( ), *getchar*( ), *gets*( ), *printf*( ), *putc*( ), *putchar*( ), *puts*( ), *scanf*( ), *ungetc*( ), *vfprintf*( ), and *vprintf*( ).

Note: Functions are defined in detail in the System Interfaces volume of IEEE Std. 1003.1-200x.

3.88 Carriage-Return Character (<carriage-return>)

A character that in the output stream indicates that printing should start at the beginning of the same physical line in which the <carriage-return> character occurred. The <carriage-return> character is the character designated by `'\r'` in the C language. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the movement to the beginning of the line.

3.89 Character

A sequence of one or more bytes representing a single graphic symbol or control code.

Note: This term corresponds to the ISO C standard term multi-byte character, where a single-byte character is a special case of a multi-byte character. Unlike the usage in the ISO C standard, *character* here has no necessary relationship with storage space, and *byte* is used when storage space is discussed.

See the definition of the Portable Character Set in Section 6.1 (on page 133) for a further explanation of the graphical representations of characters, or *glyphs*, as opposed to character encodings.

3.90 Character Array

An array of elements of type **char**.

3.91 Character Class

A named set of characters sharing an attribute associated with the name of the class. The classes and the characters that they contain are dependent on the value of the *LC_CTYPE* category in the current locale.

Note: The *LC_CTYPE* category is defined in detail in Section 7.3.1 (on page 147).

3.92 Character Set

A finite set of different characters used for the representation, organization, or control of data.

3.93 Character Special File

A file that refers to a device. One specific type of character special file is a terminal device file.

Note: The General Terminal Interface is defined in detail in Chapter 11 (on page 213).

3.94 Character String

A contiguous sequence of characters terminated by and including the first null byte.

3.95 Child Process

A new process created (by *fork*( ) or *spawn*( )) by a given process. A child process remains the child of the creating process as long as both processes continue to exist.

Note: The *fork*( ) and *spawn*( ) functions are defined in detail in the System Interfaces volume of IEEE Std. 1003.1-200x.

3.96 Circumflex

The character '^'.

3.97 Clock

A software or hardware object that can be used to measure the apparent or actual passage of time.

The current value of the time measured by a clock can be queried and, possibly, set to a value within the legal range of the clock.

3.98 Clock Jump

The difference between two successive distinct values of a clock, as observed from the application via one of the ''get time'' operations.

3.99 Clock Tick

An interval of time; an implementation-defined number of these occur each second. Clock ticks are one of the units that may be used to express a value found in type **clock_t**.

3.100 Coded Character Set

A set of unambiguous rules that establishes a character set and the one-to-one relationship between each character of the set and its bit representation.

3.101 Codeset

The result of applying rules that map a numeric code value to each element of a character set. An element of a character set may be related to more than one numeric code value but the reverse is not true. However, for state-dependent encodings the relationship between numeric code values to elements of a character set may be further controlled by state information. The character set may contain fewer elements than the total number of possible numeric code values; that is, some code values may be unassigned.

Note: Character Encoding is defined in detail in Section 6.2 (on page 136).

3.102 Collating Element

The smallest entity used to determine the logical ordering of character or wide-character strings; see also Section 3.105 (on page 59). A collating element consists of either a single character, or two or more characters collating as a single entity. The value of the *LC_COLLATE* category in the current locale determines the current set of collating elements.

3.103 Collating Element Order

The relative order of collating elements as determined by the setting of the *LC_COLLATE* category in the current locale.

The collating element order is used in range expressions in REs and is determined by the order in which collating elements are specified between **order_start** and **order_end** keywords in the *LC_COLLATE* category.

3.104 Collation

The logical ordering of character or wide-character strings according to defined precedence rules. These rules identify a collation sequence between the collating elements, and such additional rules that can be used to order strings consisting of multiple collating elements.

3.105 Collation Sequence

The relative order of collating elements as determined by the setting of the *LC_COLLATE* category in the current locale. The collation sequence is used for sorting and is determined from the collating weights assigned to each collating element. In the absence of weights, the collation sequence is also the collating element order.

Multi-level sorting is accomplished by assigning elements one or more collation weights, up to the limit {COLL_WEIGHTS_MAX}. On each level, elements may be given the same weight (at the primary level, called an equivalence class; see also Section 3.152 (on page 66)) or be omitted from the sequence. Strings that collate equal using the first assigned weight (primary ordering) are then compared using the next assigned weight (secondary ordering), and so on.

Note: {COLL_WEIGHTS_MAX} is defined in detail in **<limits.h>**.

3.106 Column Position

A unit of horizontal measure related to characters in a line.

It is assumed that each character in a character set has an intrinsic column width independent of any output device. Each printable character in the portable character set has a column width of one. The standard utilities, when used as described in IEEE Std. 1003.1-200x, assume that all characters have integral column widths. The column width of a character is not necessarily related to the internal representation of the character (numbers of bits or bytes).

The column position of a character in a line is defined as one plus the sum of the column widths of the preceding characters in the line. Column positions are numbered starting from 1.

3.107 Command

A directive to the shell to perform a particular task.

Note: Shell Commands are defined in detail in the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.9, Shell Commands.

3.108 Command Language Interpreter

An interface that interprets sequences of text input as commands. It may operate on an input stream or it may interactively prompt and read commands from a terminal. It is possible for applications to invoke utilities through a number of interfaces, which are collectively considered to act as command interpreters. The most obvious of these are the *sh* utility and the *system*( ) function, although *popen*( ) and the various forms of *exec* may also be considered to behave as interpreters.

Note: The *sh* utility is defined in detail in the Shell and Utilities volume of IEEE Std. 1003.1-200x.

The *system*( ), *popen*( ), and *exec* functions are defined in detail in the System Interfaces volume of IEEE Std. 1003.1-200x.

3.109 Composite Graphic Symbol

A graphic symbol consisting of a combination of two or more other graphic symbols in a single character position, such as a diacritical mark and a base character.

3.110 Condition Variable

A synchronization object which allows a thread to suspend execution, repeatedly, until some associated predicate becomes true. A thread whose execution is suspended on a condition variable is said to be blocked on the condition variable.

3.111 Connection

An association established between two or more endpoints for the transfer of data

3.112 Connection Mode

The transfer of data in the context of a connection; see also Section 3.113.

3.113 Connectionless Mode

The transfer of data other than in the context of a connection; see also Section 3.112 and Section 3.126 (on page 62).

3.114 Control Character

A character, other than a graphic character, that affects the recording, processing, transmission, or interpretation of text.

3.115 Control Operator

In the shell command language, a token that performs a control function. It is one of the following symbols:

```
&    &&    (    )    ;    ;;    newline    |    ||
```

The end-of-input indicator used internally by the shell is also considered a control operator.

Note: Token Recognition is defined in detail in the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.3, Token Recognition.

3.116 Controlling Process

The session leader that established the connection to the controlling terminal. If the terminal subsequently ceases to be a controlling terminal for this session, the session leader ceases to be the controlling process.

3.117 Controlling Terminal

A terminal that is associated with a session. Each session may have at most one controlling terminal associated with it, and a controlling terminal is associated with exactly one session. Certain input sequences from the controlling terminal cause signals to be sent to all processes in the process group associated with the controlling terminal.

Note: The General Terminal Interface is defined in detail in Chapter 11 (on page 213).

3.118 Conversion Descriptor

A per-process unique value used to identify an open codeset conversion.

3.119 Core File

A file of unspecified format that may be generated when a process terminates abnormally.

3.120 CPU Time (Execution Time)

The time spent executing a process or thread, including the time spent executing system services on behalf of that process or thread. If the Threads option is supported, then the value of the CPU-time clock for a process is implementation-defined. With this definition the sum of all the execution times of all the threads in a process might not equal the process execution time, even in a single-threaded process, because implementations may differ in how they account for time during context switches or for other reasons.

3.121 CPU-Time Clock

A clock that measures the execution time of a particular process or thread.

3.122 CPU-Time Timer

A timer attached to a CPU-time clock.

3.123 Current Job

In the context of job control, the job that will be used as the default for the *fg* or *bg* utilities. There is at most one current job; see also Section 3.205 (on page 76).

3.124 Current Working Directory

See *Working Directory* in Section 3.438 (on page 117).

3.125 Cursor Position

The line and column position on the screen denoted by the terminal's cursor.

3.126 Datagram

A unit of data transferred from one endpoint to another in connectionless mode service.

3.127 Data Segment

Memory associated with a process, that can contain dynamically allocated data.

3.128 Deferred Batch Service

A service that is performed as a result of events that are asynchronous with respect to requests.

Note: Once a batch job has been created, it is subject to deferred services.

3.129 Device

A computer peripheral or an object that appears to the application as such.

3.130 Device ID

A non-negative integer used to identify a device.

3.131 Directory

A file that contains directory entries. No two directory entries in the same directory have the same name.

3.132 Directory Entry (or Link)

An object that associates a file name with a file. Several directory entries can associate names with the same file.

3.133 Directory Stream

A sequence of all the directory entries in a particular directory. An open directory stream may be implemented using a file descriptor.

3.134 Disarm (a Timer)

To stop a timer from measuring the passage of time, disabling any future process notifications (until the timer is armed again).

3.135 Display

To output to the user's terminal. If the output is not directed to a terminal, the results are undefined.

3.136 Dollar Sign

The character '$'.

3.137 Dot

In the context of naming files, the file name consisting of a single dot character ('.').

Note: In the context of shell special built-in utilities, see *dot* in the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.15, Special Built-In Utilities.

Path Name Resolution is defined in detail in Section 4.9 (on page 123).

3.138 Dot-Dot

The file name consisting solely of two dot characters ("..").

Note: Path Name Resolution is defined in detail in Section 4.9 (on page 123).

3.139 Double-Quote

The character '"', also known as *quotation-mark*.

Note: The *double* adjective in this term refers to the two strokes in the character glyph. IEEE Std. 1003.1-200x never uses the term double-quote to refer to two apostrophes or quotation marks.

3.140 Downshifting

The conversion of an uppercase character that has a single-character lowercase representation into this lowercase representation.

3.141 Driver

A module that controls data transferred to and received from devices.

Note: Drivers are traditionally written to be a part of the system implementation, although they are frequently written separately from the writing of the implementation. A driver may contain processor-specific code, and therefore be non-portable.

3.142 Effective Group ID

An attribute of a process that is used in determining various permissions, including file access permissions; see also Section 3.190 (on page 73).

3.143 Effective User ID

An attribute of a process that is used in determining various permissions, including file access permissions; see also Section 3.427 (on page 115).

3.144 Eight-Bit Transparency

The ability of a software component to process 8-bit characters without modifying or utilizing any part of the character in a way that is inconsistent with the rules of the current coded character set.

3.145 Empty Directory

A directory that contains, at most, directory entries for dot and dot-dot, and has exactly one link to it in dot-dot. No other links to the directory may exist. It is unspecified whether an implementation can ever consider the root directory to be empty.

3.146 Empty Line

A line consisting of only a <newline> character; see also Section 3.76 (on page 53).

3.147 Empty String (or Null String)

A string whose first byte is a null byte.

3.148 Empty Wide-Character String

A wide-character string whose first element is a null wide-character code.

3.149 Encoding Rule

The rules used to convert between wide-character codes and multi-byte character codes.

Note: Stream Orientation and Encoding Rules are defined in detail in the System Interfaces volume of IEEE Std. 1003.1-200x, Section 2.5.2, Stream Orientation and Encoding Rules.

3.150 Entire Regular Expression

The concatenated set of one or more BREs or EREs that make up the pattern specified for string selection.

Note: Regular Expressions are defined in detail in Chapter 9 (on page 195).

3.151 Epoch

The time zero hours, zero minutes, zero seconds, on January 1, 1970 Coordinated Universal Time.

Note: See also Seconds Since the Epoch defined in Section 4.12 (on page 125).

3.152 Equivalence Class

A set of collating elements with the same primary collation weight.

Elements in an equivalence class are typically elements that naturally group together, such as all accented letters based on the same base letter.

The collation order of elements within an equivalence class is determined by the weights assigned on any subsequent levels after the primary weight.

3.153 Era

An alternative method for counting and displaying years.

Note: The *LC_TIME* category is defined in detail in Section 7.3.5 (on page 168).

3.154 Event Management

The mechanism that enables applications to register for and be made aware of external events such as data becoming available for reading.

3.155 Executable File

A regular file acceptable as a new process image file by the equivalent of the *exec* family of functions, and thus usable as one form of a utility. The standard utilities described as compilers can produce executable files, but other unspecified methods of producing executable files may also be provided. The internal format of an executable file is unspecified, but a conforming application cannot assume an executable file is a text file.

3.156 Execute

In the Shell and Utilities volume of IEEE Std. 1003.1-200x, to perform command search and execution actions; see also Section 3.202 (on page 75).

Note: Command Search and Execution is defined in detail in the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.9.1.1, Command Search and Execution.

3.157 Execution Time

See *CPU Time* in Section 3.120 (on page 62).

3.158 Execution Time Monitoring

A set of execution time monitoring primitives that allow online measuring of thread and process execution times.

3.159 Expand

In the shell command language, when not qualified, the act of applying word expansions.

Note: Work Expansions are defined in detail in the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.6, Word Expansions.

3.160 Extended Regular Expression (ERE)

A regular expression (see also Section 3.318 (on page 95)) that is an alternative to the Basic Regular Expression using a more extensive syntax, occasionally used by some utilities.

Note: Extended Regular Expressions are described in detail in Section 9.4 (on page 203).

3.161 Extended Security Controls

Implementation-defined security controls allowed by the file access permission and appropriate privilege (see also Section 3.19 (on page 44)) mechanisms, through which an implementation can support different security policies from those described in IEEE Std. 1003.1-200x.

Note: See also Extended Security Controls defined in Section 4.2 (on page 121).

File Access Permissions are defined in detail in Section 4.3 (on page 121).

3.162 Feature Test Macro

A macro used to determine whether a particular set of features is included from a header.

Note: See also the System Interfaces volume of IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment.

3.163 Field

In the shell command language, a unit of text that is the result of parameter expansion, arithmetic expansion, command substitution, or field splitting. During command processing, the resulting fields are used as the command name and its arguments.

Note: Parameter Expansion is defined in detail in the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.6.2, Parameter Expansion.

Arithmetic Expansion is defined in detail in the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.6.4, Arithmetic Expansion.

Command Substitution is defined in detail in the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.6.3, Command Substitution.

Field Splitting is defined in detail in the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.6.5, Field Splitting.

For further information on command processing, see the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.9.1, Simple Commands.

3.164 FIFO Special File (or FIFO)

A type of file with the property that data written to such a file is read on a first-in-first-out basis.

Note: Other characteristics of FIFOs are described in the System Interfaces volume of IEEE Std. 1003.1-200x, *lseek*( ), *open*( ), *read*( ), and *write*( ).

3.165 File

An object that can be written to, or read from, or both. A file has certain attributes, including access permissions and type. File types include regular file, character special file, block special file, FIFO special file, symbolic link, socket, and directory. Other types of files may be supported by the implementation.

3.166 File Description

See *Open File Description* in Section 3.255 (on page 84).

3.167 File Descriptor

A per-process unique, non-negative integer used to identify an open file for the purpose of file access. The value of a file descriptor is from zero to {OPEN_MAX}. A process can have no more than {OPEN_MAX} file descriptors open simultaneously. File descriptors may also be used to implement message catalog descriptors and directory streams; see also Section 3.255 (on page 84).

Note: {OPEN_MAX} is defined in detail in **<limits.h>**.

3.168 File Group Class

The property of a file indicating access permissions for a process related to the group identification of a process. A process is in the file group class of a file if the process is not in the file owner class and if the effective group ID or one of the supplementary group IDs of the process matches the group ID associated with the file. Other members of the class may be implementation-defined.

3.169 File Mode

An object containing the *file mode bits* and file type of a file.

Note: File mode bits and file types are defined in detail in **<sys/stat.h>**.

3.170 File Mode Bits

A file's file permission bits, set-user-ID-on-execution bit (S_ISUID), and set-group-ID-on-execution bit (S_ISGID).

Note: File Mode Bits are defined in detail in **<sys/stat.h>**.

3.171 File Name

A name consisting of 1 to {NAME_MAX} bytes used to name a file. The characters composing the name may be selected from the set of all character values excluding the slash character and the null byte. The file names dot and dot-dot have special meaning. A file name is sometimes referred to as a *path name component*.

Note: Path Name Resolution is defined in detail in Section 4.9 (on page 123).

3.172 File Name Portability

File names should be constructed from the portable file name character set because the use of other characters can be confusing or ambiguous in certain contexts. (For example, the use of a colon (':') in a path name could cause ambiguity if that path name were included in a *PATH* definition.)

3.173 File Offset

The byte position in the file where the next I/O operation begins. Each open file description associated with a regular file, block special file, or directory has a file offset. A character special file that does not refer to a terminal device may have a file offset. There is no file offset specified for a pipe or FIFO.

3.174 File Other Class

The property of a file indicating access permissions for a process related to the user and group identification of a process. A process is in the file other class of a file if the process is not in the file owner class or file group class.

3.175 File Owner Class

The property of a file indicating access permissions for a process related to the user identification of a process. A process is in the file owner class of a file if the effective user ID of the process matches the user ID of the file.

3.176 File Permission Bits

Information about a file that is used, along with other information, to determine whether a process has read, write, or execute/search permission to a file. The bits are divided into three parts: owner, group, and other. Each part is used with the corresponding file class of processes. These bits are contained in the file mode.

Note: File modes are defined in detail in **<sys/stat.h>**.

File Access Permissions are defined in detail in Section 4.3 (on page 121).

3.177 File Serial Number

A per-file system unique identifier for a file.

3.178 File System

A collection of files and certain of their attributes. It provides a name space for file serial numbers referring to those files.

3.179 File Type

See *File* in Section 3.165 (on page 69).

3.180 Filter

A command whose operation consists of reading data from standard input or a list of input files and writing data to standard output. Typically, its function is to perform some transformation on the data stream.

3.181 First Open (of a File)

When a process opens a file that is not currently an open file within any process.

3.182 Flow Control

The mechanism employed by a communications provider that constrains a sending entity to wait until the receiving entities can safely receive additional data without loss.

3.183 Foreground Job

See *Foreground Process Group* in Section 3.185.

3.184 Foreground Process

A process that is a member of a foreground process group.

3.185 Foreground Process Group (or Foreground Job)

A process group whose member processes have certain privileges, denied to processes in background process groups, when accessing their controlling terminal. Each session that has established a connection with a controlling terminal has at most one process group of the session as the foreground process group of that controlling terminal.

Note: The General Terminal Interface is defined in detail in Chapter 11.

3.186 Foreground Process Group ID

The process group ID of the foreground process group.

3.187 Form-Feed Character (<form-feed>)

A character that in the output stream indicates that printing should start on the next page of an output device. The <form-feed> character is the character designated by `'\f'` in the C language. If the <form-feed> character is not the first character of an output line, the result is unspecified. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the movement to the next page.

3.188 Graphic Character

A member of the **graph** character class of the current locale.

Note: The **graph** character class is defined in detail in Section 7.3.1 (on page 147).

3.189 Group Database

A system database of implementation-defined format that contains at least the following information for each group ID:

- Group name
- Numerical group ID
- List of users allowed in the group

The list of users allowed in the group is used by the *newgrp* utility.

Note: The *newgrp* utility is defined in detail in the Shell and Utilities volume of IEEE Std. 1003.1-200x.

3.190 Group ID

A non-negative integer, which can be contained in an object of type **gid_t**, that is used to identify a group of system users. Each system user is a member of at least one group. When the identity of a group is associated with a process, a group ID value is referred to as a real group ID, an effective group ID, one of the supplementary group IDs, or a saved set-group-ID.

3.191 Group Name

A string that is used to identify a group; see also Section 3.189. To be portable across conforming systems, the value is composed of characters from the portable file name character set. The hyphen should not be used as the first character of a portable group name.

3.192 Hard Limit

A system resource limitation that may be reset to a lesser or greater limit by a privileged process. A non-privileged process is restricted to only lowering its hard limit.

3.193 Hard Link

The relationship between two directory entries that represent the same file; see also Section 3.132 (on page 63). The result of an execution of the *ln* utility (without the **–s** option) or the *link*( ) function. This term is contrasted against symbolic link; see also Section 3.374 (on page 104).

3.194 Home Directory

The directory specified by the *HOME* environment variable.

3.195 Host Byte Order

The arrangement of bytes in any **int** type when using a specific machine architecture.

Note: Two common methods of byte ordering are big-endian and little-endian. Big-endian is a format for storage of binary data in which the most significant byte is placed first, with the rest in descending order. Little-endian is a format for storage or transmission of binary data in which the least significant byte is placed first, with the rest in ascending order.

3.196 Incomplete Line

A sequence of one or more non-<newline> characters at the end of the file.

3.197 Inf

A value representing infinity that can be stored in a floating type. Not all systems support the Inf value.

3.198 Instrumented Application

An application that contains at least one call to the trace point function *posix_trace_event*( ). Each process of an instrumented application has a mapping of trace event names to trace event type identifiers. This mapping is used by the trace stream that is created for that process.

3.199 Interactive Shell

A processing mode of the shell that is suitable for direct user interaction.

3.200 Internationalization

The provision within a computer program of the capability of making itself adaptable to the requirements of different native languages, local customs, and coded character sets.

3.201 Interprocess Communication

A functionality enhancement to add a high-performance, deterministic interprocess communication facility for local communication.

3.202 Invoke

To perform command search and execution actions, except that searching for shell functions and special built-in utilities is suppressed; see also Section 3.156 (on page 67).

Note: Command Search and Execution is defined in detail in the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.9.1.1, Command Search and Execution.

3.203 Job

A set of processes, comprising a shell pipeline, and any processes descended from it, that are all in the same process group.

Note: See also the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.9.2, Pipelines.

3.204 Job Control

A facility that allows users selectively to stop (suspend) the execution of processes and continue (resume) their execution at a later point. The user typically employs this facility via the interactive interface jointly supplied by the terminal I/O driver and a command interpreter.

3.205 Job Control Job ID

A handle that is used to refer to a job. The job control job ID can be any of the forms shown in the following table:

Table 3-1 Job Control Job ID Formats

Job Control Job ID	Meaning
%%	Current job.
%+	Current job.
%–	Previous job.
%*n*	Job number *n*.
%*string*	Job whose command begins with *string*.
%?*string*	Job whose command contains *string*.

3.206 Last Close (of a File)

When a process closes a file, resulting in the file not being an open file within any process.

3.207 Line

A sequence of zero or more non-<newline> characters plus a terminating <newline> character.

3.208 Linger

Wait for a period of time before terminating a connection, to allow outstanding data to be transferred.

3.209 Link

See *Directory Entry* in Section 3.132 (on page 63).

3.210 Link Count

The number of directory entries that refer to a particular file.

3.211 Local Customs

The conventions of a geographical area or territory for such things as date, time, and currency formats.

3.212 Local Interprocess Communication (Local IPC)

The transfer of data between processes in the same system.

3.213 Locale

The definition of the subset of a user's environment that depends on language and cultural conventions.

Note: Locales are defined in detail in Chapter 7 (on page 143).

3.214 Localization

The process of establishing information within a computer system specific to the operation of particular native languages, local customs, and coded character sets.

3.215 Login

The unspecified activity by which a user gains access to the system. Each login is associated with exactly one login name.

3.216 Login Name

A user name that is associated with a login.

3.217 Map

To create an association between a page-aligned range of the address space of a process and some memory object, such that a reference to an address in that range of the address space results in a reference to the associated memory object. The mapped memory object is not necessarily memory-resident.

3.218 Marked Message

A STREAMs message on which a certain flag is set. Marking a message gives the application protocol-specific information. An application can use *ioctl*( ) to determine whether a given message is marked.

Note: The *ioctl*( ) function is defined in detail in the System Interfaces volume of IEEE Std. 1003.1-200x.

3.219 Matched

A state applying to a sequence of zero or more characters when the characters in the sequence correspond to a sequence of characters defined by a BRE or ERE pattern.

Note: Regular Expressions are defined in detail in Chapter 9 (on page 195).

3.220 Memory Mapped Files and Shared Memory Objects

A performance improvement facility to allow for programs to access files as part of the address space and for separate application programs to have portions of their address space commonly accessible.

3.221 Memory Object

One of:

- A file
- A shared memory object
- A typed memory object

When used in conjunction with *mmap*( ), a memory object appears in the address space of the calling process.

Note: The *mmap*( ) function is defined in detail in the System Interfaces volume of IEEE Std. 1003.1-200x.

3.222 Memory-Resident

Managed by the implementation in such a way as to provide an upper bound on memory access times.

3.223 Message

In the context of programmatic message passing, information that can be transferred between processes or threads by being added to and removed from a message queue. A message consists of a fixed-size message buffer.

3.224 Message Catalog

In the context of providing natural language messages to the user, a file or storage area containing program messages, command prompts, and responses to prompts for a particular native language, territory, and codeset.

3.225 Message Catalog Descriptor

In the context of providing natural language messages to the user, a per-process unique value used to identify an open message catalog. A message catalog descriptor may be implemented using a file descriptor.

3.226 Message Queue

In the context of programmatic message passing, an object to which messages can be added and removed. Messages may be removed in the order in which they were added or in priority order.

3.227 Mode

A collection of attributes that specifies a file's type and its access permissions.

Note: File Access Permissions are defined in detail in Section 4.3 (on page 121).

3.228 Monotonic Clock

A clock whose value cannot be set via *clock_settime*( ) and which cannot have negative clock jumps.

3.229 Mount Point

Either the system root directory or a directory for which the *st_dev* field of structure **stat** differs from that of its parent directory.

Note: The **stat** structure is defined in detail in **<sys/stat.h>**.

3.230 Multi-Character Collating Element

A sequence of two or more characters that collate as an entity. For example, in some coded character sets, an accented character is represented by a non-spacing accent, followed by the letter. Other examples are the Spanish elements *ch* and *ll*.

3.231 Mutex

A synchronization object used to allow multiple threads to serialize their access to shared data. The name derives from the capability it provides; namely, mutual-exclusion. The thread that has locked a mutex becomes its owner and remains the owner until that same thread unlocks the mutex.

3.232 Name

In the shell command language, a word consisting solely of underscores, digits, and alphabetics from the portable character set. The first character of a name is not a digit.

Note: The Portable Character Set is defined in detail in Section 6.1 (on page 133).

3.233 Named STREAM

A STREAMS-based file descriptor that is attached to a name in the file system name space. All subsequent operations on the named STREAM act on the STREAM that was associated with the file descriptor until the name is disassociated from the STREAM.

3.234 NaN (Not a Number)

A value that can be stored in a floating type but that is not a valid floating point number. Not all systems support the NaN value.

3.235 Native Language

A computer user's spoken or written language, such as American English, British English, Danish, Dutch, French, German, Italian, Japanese, Norwegian, or Swedish.

3.236 Negative Response

An input string that matches one of the responses acceptable to the *LC_MESSAGES* category keyword **noexpr**, matching an extended regular expression in the current locale.

Note: The *LC_MESSAGES* category is defined in detail in Section 7.3.6 (on page 174).

3.237 Network

A collection of interconnected hosts.

Note: The term network in IEEE Std. 1003.1-200x is used to refer to the network of hosts. The term batch system is used to refer to the network of batch servers.

3.238 Network Address

A network-visible identifier used to designate specific endpoints in a network. Specific endpoints on host systems have addresses, and host systems may also have addresses.

3.239 Network Byte Order

The way of representing any **int** type such that, when transmitted over a network via a network endpoint, the **int** type is transmitted as an appropriate number of octets with the most significant octet first, followed by any other octets in descending order of significance.

Note: This order is more commonly known as big-endian ordering.

3.240 Newline Character (<newline>)

A character that in the output stream indicates that printing should start at the beginning of the next line. The <newline> character is the character designated by '\n' in the C language. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the movement to the next line.

3.241 Nice Value

A number used as advice to the system to alter process scheduling. Numerically smaller values give a process additional preference when scheduling a process to run. Numerically larger values reduce the preference and make a process less likely to run. Typically, a process with a smaller nice value runs to completion more quickly than an equivalent process with a higher nice value. The symbol {NZERO} specifies the default nice value of the system.

3.242 Non-Blocking

A property of an open file description that causes it to either perform the requested action or return an indication that the action could not be immediately performed, in either case returning without delay (other than normal scheduling delays) from the call.

Note: The exact semantics are dependent on the type of file associated with the open file. For data reads from devices such as ttys and FIFOs, a successful return usually indicates that data sufficient to satisfy the read was immediately available. Similarly, for writes, that space to perform (at least part of) the write was available, and for networking not to await protocol events (for example, acknowledgements) to occur.

3.243 Non-Spacing Characters

A character, such as a character representing a diacritical mark in the ISO/IEC 6937:1994 standard coded character set, which is used in combination with other characters to form composite graphic symbols.

3.244 NUL

A character with all bits set to zero.

3.245 Null Byte

A byte with all bits set to zero.

3.246 Null Pointer

The value that is obtained by converting the number 0 into a pointer; for example, (**void** *) 0. The C language guarantees that this value does not match that of any legitimate pointer, so it is used by many functions that return pointers to indicate an error.

3.247 Null String

See *Empty String* in Section 3.147 (on page 66).

3.248 Null Wide-Character Code

A wide-character code with all bits set to zero.

3.249 Number Sign

The character '#', also known as *hash sign*.

3.250 Object File

A regular file containing the output of a compiler, formatted as input to a linkage editor for linking with other object files into an executable form. The methods of linking are unspecified and may involve the dynamic linking of objects at runtime. The internal format of an object file is unspecified, but a conforming application cannot assume an object file is a text file.

3.251 Octet

Unit of data representation that consists of eight contiguous bits.

3.252 Offset Maximum

An attribute of an open file description representing the largest value that can be used as a file offset.

3.253 Opaque Address

An address such that the entity making use of it requires no details about its contents or format.

3.254 Open File

A file that is currently associated with a file descriptor.

3.255 Open File Description

A record of how a process or group of processes is accessing a file. Each file descriptor refers to exactly one open file description, but an open file description can be referred to by more than one file descriptor. A file offset, file status, and file access modes are attributes of an open file description.

3.256 Operand

An argument to a command that is generally used as an object supplying information to a utility necessary to complete its processing. Operands generally follow the options in a command line.

Note: Utility Argument Syntax is defined in detail in Section 12.1 (on page 227).

3.257 Operator

In the shell command language, either a control operator or a redirection operator.

3.258 Option

An argument to a command that is generally used to specify changes in the utility's default behavior.

Note: Utility Argument Syntax is defined in detail in Section 12.1 (on page 227).

3.259 Option-Argument

A parameter that follows certain options. In some cases an option-argument is included within the same argument string as the option—in most cases it is the next argument.

Note: Utility Argument Syntax is defined in detail in Section 12.1 (on page 227).

3.260 Orientation

A stream has one of three orientations: unoriented, byte-oriented, or wide-oriented.

Note: For further information, see the System Interfaces volume of IEEE Std. 1003.1-200x, Section 2.5.2, Stream Orientation and Encoding Rules.

3.261 Orphaned Process Group

A process group in which the parent of every member is either itself a member of the group or is not a member of the group's session.

3.262 Page

The granularity of process memory mapping or locking.

Physical memory and memory objects can be mapped into the address space of a process on page boundaries and in integral multiples of pages. Process address space can be locked into memory (made memory-resident) on page boundaries and in integral multiples of pages.

3.263 Page Size

The size, in bytes, of the system unit of memory allocation, protection, and mapping. On systems that have segment rather than page-based memory architectures, the term page means a segment.

3.264 Parameter

In the shell command language, an entity that stores values. There are three types of parameters: variables (named parameters), positional parameters, and special parameters. Parameter expansion is accomplished by introducing a parameter with the `'$'` character.

Note: See also the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.5, Parameters and Variables.

In the C language, an object declared as part of a function declaration or definition that acquires a value on entry to the function, or an identifier following the macro name in a function-like macro definition.

3.265 Parent Directory

When discussing a given directory, the directory that both contains a directory entry for the given directory and is represented by the path name dot-dot in the given directory.

When discussing other types of files, a directory containing a directory entry for the file under discussion.

This concept does not apply to dot and dot-dot.

3.266 Parent Process

The process which created (or inherited) the process under discussion.

3.267 Parent Process ID

An attribute of a new process identifying the parent of the process. The parent process ID of a process is the process ID of its creator, for the lifetime of the creator. After the creator's lifetime has ended, the parent process ID is the process ID of an implementation-defined system process.

3.268 Path Name

A character string that is used to identify a file. In the context of IEEE Std. 1003.1-200x, a path name consists of, at most, {PATH_MAX} bytes, including the terminating null byte. It has an optional beginning slash, followed by zero or more file names separated by slashes. A path name may optionally contain one or more trailing slashes. Multiple successive slashes are considered to be the same as one slash.

Note: Path Name Resolution is defined in detail in Section 4.9 (on page 123).

3.269 Path Name Component

See *File Name* in Section 3.171 (on page 70).

3.270 Path Prefix

A path name, with an optional ending slash, that refers to a directory.

3.271 Pattern

A sequence of characters used either with regular expression notation or for path name expansion, as a means of selecting various character strings or path names, respectively.

Note: Regular Expressions are defined in detail in Chapter 9 (on page 195).

See also the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.6.6, Path Name Expansion.

The syntaxes of the two types of patterns are similar, but not identical; IEEE Std. 1003.1-200x always indicates the type of pattern being referred to in the immediate context of the use of the term.

3.272 Period

The character '.'. The term period is contrasted with dot (see also Section 3.137 (on page 64)), which is used to describe a specific directory entry.

3.273 Permissions

Attributes of an object that determine the privilege necessary to access or manipulate the object.

Note: File Access Permissions are defined in detail in Section 4.3 (on page 121).

3.274 Persistence

A mode for semaphores, shared memory, and message queues requiring that the object and its state (including data, if any) are preserved after the object is no longer referenced by any process.

Persistence of an object does not imply that the state of the object is maintained across a system crash or a system reboot.

3.275 Pipe

An object accessed by one of the pair of file descriptors created by the *pipe*() function. Once created, the file descriptors can be used to manipulate it, and it behaves identically to a FIFO special file when accessed in this way. It has no name in the file hierarchy.

Note: The *pipe*() function is defined in detail in the System Interfaces volume of IEEE Std. 1003.1-200x.

3.276 Polling

A scheduling scheme whereby the local process periodically checks until the prespecified events (for example, read, write) have occurred.

3.277 Portable Character Set

The collection of characters that are required to be present in all locales supported by conforming systems.

Note: The Portable Character Set is defined in detail in Section 6.1 (on page 133).

This term is contrasted against the smaller *portable file name character set*; see also Section 3.278.

3.278 Portable File Name Character Set

The set of characters from which portable file names are constructed.

```
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
a b c d e f g h i j k l m n o p q r s t u v w x y z
0 1 2 3 4 5 6 7 8 9 . _ -
```

The last three characters are the period, underscore, and hyphen characters, respectively.

3.279 Positional Parameter

In the shell command language, a parameter denoted by a single digit or one or more digits in curly braces.

Note: For further information, see the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.5.1, Positional Parameters.

3.280 Preallocation

The reservation of resources in a system for a particular use.

Preallocation does not imply that the resources are immediately allocated to that use, but merely indicates that they are guaranteed to be available in bounded time when needed.

3.281 Preempted Process (or Thread)

A running thread whose execution is suspended due to another thread becoming runnable at a higher priority.

3.282 Previous Job

In the context of job control, the job that will be used as the default for the *fg* or *bg* utilities if the current job exits. There is at most one previous job; see also Section 3.205 (on page 76).

3.283 Printable Character

One of the characters included in the **print** character classification of the *LC_CTYPE* category in the current locale.

Note: The *LC_CTYPE* category is defined in detail in Section 7.3.1 (on page 147).

3.284 Printable File

A text file consisting only of the characters included in the **print** and **space** character classifications of the *LC_CTYPE* category and the <backspace> character, all in the current locale.

Note: The *LC_CTYPE* category is defined in detail in Section 7.3.1 (on page 147).

3.285 Priority

A non-negative integer associated with processes or threads whose value is constrained to a range defined by the applicable scheduling policy. Numerically higher values represent higher priorities.

3.286 Priority Band

The queuing order applied to normal priority STREAMS messages. High priority STREAMS messages are not grouped by priority bands. The only differentiation made by the STREAMS mechanism is between zero and non-zero bands, but specific protocol modules may differentiate between priority bands.

3.287 Priority Inversion

A condition in which a thread that is not voluntarily suspended (waiting for an event or time delay) is not running while a lower priority thread is running. Such blocking of the higher priority thread is often caused by contention for a shared resource.

3.288 Priority Scheduling

A performance and determinism improvement facility to allow applications to determine the order in which threads that are ready to run are granted access to processor resources.

3.289 Priority-Based Scheduling

Scheduling in which the selection of a running thread is determined by the priorities of the runnable processes or threads.

3.290 Privilege

See *Appropriate Privileges* in Section 3.19 (on page 44).

3.291 Process

An address space with one or more threads executing within that address space, and the required system resources for those threads.

Note: Many of the system resources defined by IEEE Std. 1003.1-200x are shared among all of the threads within a process. These include the process ID, the parent process ID, process group ID, session membership, real, effective, and saved-set user ID, real, effective, and saved-set group ID, supplementary group IDs, current working directory, root directory, file mode creation mask, and file descriptors.

3.292 Process Group

A collection of processes that permits the signaling of related processes. Each process in the system is a member of a process group that is identified by a process group ID. A newly created process joins the process group of its creator.

3.293 Process Group ID

The unique positive integer identifier representing a process group during its lifetime.

Note: See also Process Group ID Reuse defined in Section 4.10 (on page 124).

3.294 Process Group Leader

A process whose process ID is the same as its process group ID.

3.295 Process Group Lifetime

A period of time that begins when a process group is created and ends when the last remaining process in the group leaves the group, due either to the end of the last process' lifetime or to the last remaining process calling the *setsid*( ) or *setpgid*( ) functions.

Note: The *setsid*( ) and *setpgid*( ) functions are defined in detail in the System Interfaces volume of IEEE Std. 1003.1-200x.

3.296 Process ID

The unique positive integer identifier representing a process during its lifetime.

Note: See also Process ID Reuse defined in Section 4.10 (on page 124).

3.297 Process Lifetime

The period of time that begins when a process is created and ends when its process ID is returned to the system. After a process is created with a *fork*( ) function, it is considered active. At least one thread of control and address space exist until it terminates. It then enters an inactive state where certain resources may be returned to the system, although some resources, such as the process ID, are still in use. When another process executes a *wait*( ), *waitid*( ), or *waitpid*( ) function for an inactive process, the remaining resources are returned to the system. The last resource to be returned to the system is the process ID. At this time, the lifetime of the process ends.

Note: The *fork*( ), *wait*( ), *waitid*( ), and *waitpid*( ) functions are defined in detail in the System Interfaces volume of IEEE Std. 1003.1-200x.

3.298 Process Memory Locking

A performance improvement facility to bind application programs into the high-performance random access memory of a computer system. This avoids potential latencies introduced by the operating system in storing parts of a program that were not recently referenced on secondary memory devices.

3.299 Process Termination

There are two kinds of process termination:

1. Normal termination occurs by a return from *main*( ) or when requested with the *exit*( ) or *_exit*( ) functions.
2. Abnormal termination occurs when requested by the *abort*( ) function or when some signals are received.

Note: The *_exit*( ), *abort*( ), and *exit*( ) functions are defined in detail in the System Interfaces volume of IEEE Std. 1003.1-200x.

3.300 Process-To-Process Communication

The transfer of data between processes.

3.301 Process Virtual Time

The measurement of time in units elapsed by the system clock while a process is executing. |

3.302 Program

A prepared sequence of instructions to the system to accomplish a defined task. The term program in IEEE Std. 1003.1-200x encompasses applications written in the Shell Command Language, complex utility input languages (for example, *awk*, *lex*, *sed*, and so on), and high-level languages.

3.303 Protocol

A set of semantic and syntactic rules for exchanging information.

3.304 Pseudo-Terminal

A pseudo-terminal provides the process with an interface that is identical to the terminal subsystem. A pseudo-terminal is composed of two devices: the *master device* and a *slave device*. The slave device provides processes with an interface that is identical to the terminal interface, although there need not be hardware behind that interface. Anything written on the master device is presented to the slave as an input and anything written on the slave device is presented as an input on the master side.

3.305 Radix Character

The character that separates the integer part of a number from the fractional part.

3.306 Read-Only File System

A file system that has implementation-defined characteristics restricting modifications.

Note: File Times Update is described in detail in Section 4.6 (on page 122).

3.307 Read-Write Lock

Multiple readers, single writer (read-write) locks allow many threads to have simultaneous read-only access to data while allowing only one thread to have write access at any given time. They are typically used to protect data that is read-only more frequently than it is changed.

Read-write locks can be used to synchronize threads in the current process and other processes if they are allocated in memory that is writable and shared among the cooperating processes and have been initialized for this behavior.

3.308 Real Group ID

The attribute of a process that, at the time of process creation, identifies the group of the user who created the process; see also Section 3.190 (on page 73).

3.309 Real Time

Time measured as total units elapsed by the system clock without regard to which thread is executing.

3.310 Realtime Signal Extension

A determinism improvement facility to enable asynchronous signal notifications to an application to be queued without impacting compatibility with the existing signal functions.

3.311 Real User ID

The attribute of a process that, at the time of process creation, identifies the user who created the process; see also Section 3.427 (on page 115).

3.312 Record

A collection of related data units or words which is treated as a unit.

3.313 Redirection

In the shell command language, a method of associating files with the input or output of commands.

Note: For further information, see the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.7, Redirection.

3.314 Redirection Operator

In the shell command language, a token that performs a redirection function. It is one of the following symbols:

< > >| << >> <& >& <<– <>

3.315 Reentrant Function

A function whose effect, when called by two or more threads, is guaranteed to be as if the threads each executed the function one after another in an undefined order, even if the actual execution is interleaved.

3.316 Referenced Shared Memory Object

A shared memory object that is open or has one or more mappings defined on it.

3.317 Refresh

To ensure that the information on the user's terminal screen is up-to-date.

3.318 Regular Expression

A pattern that selects specific strings from a set of character strings.

Note: Regular Expressions are described in detail in Chapter 9 (on page 195).

3.319 Region

In the context of the address space of a process, a sequence of addresses.

In the context of a file, a sequence of offsets.

3.320 Regular File

A file that is a randomly accessible sequence of bytes, with no further structure imposed by the system.

3.321 Relative Path Name

A path name not beginning with a slash.

Note: Path Name Resolution is defined in detail in Section 4.9 (on page 123).

3.322 Relocatable File

A file holding code or data suitable for linking with other object files to create an executable or a shared object file.

3.323 Relocation

The process of connecting symbolic references with symbolic definitions. For example, when a program calls a function, the associated call instruction transfers control to the proper destination address at execution.

3.324 Requested Batch Service

A service that is either rejected or performed prior to a response from the service to the requester.

3.325 (Time) Resolution

The minimum time interval that a clock can measure or whose passage a timer can detect.

3.326 Root Directory

A directory, associated with a process, that is used in path name resolution for path names that begin with a slash.

3.327 Runnable Process (or Thread)

A thread that is capable of being a running thread, but for which no processor is available.

3.328 Running Process (or Thread)

A thread currently executing on a processor. On multi-processor systems there may be more than one such thread in a system at a time.

3.329 Saved Resource Limits

An attribute of a process that provides some flexibility in the handling of unrepresentable resource limits, as described in the *exec* family of functions and *setrlimit*( ).

Note: The *exec* and *setrlimit*( ) functions are defined in detail in the System Interfaces volume of IEEE Std. 1003.1-200x.

3.330 Saved Set-Group-ID

An attribute of a process that allows some flexibility in the assignment of the effective group ID attribute, as described in the *exec* family of functions and *setgid*( ).

Note: The *exec* and *setgid*( ) functions are defined in detail in the System Interfaces volume of IEEE Std. 1003.1-200x.

3.331 Saved Set-User-ID

An attribute of a process that allows some flexibility in the assignment of the effective user ID attribute, as described in the *exec* family of functions and *setuid*( ).

Note: The *exec* and *setuid*( ) functions are defined in detail in the System Interfaces volume of IEEE Std. 1003.1-200x.

3.332 Scheduling

The application of a policy to select a runnable process or thread to become a running process or thread, or to alter one or more of the thread lists.

3.333 Scheduling Allocation Domain

The set of processors on which an individual thread can be scheduled at any given time.

3.334 Scheduling Contention Scope

A property of a thread that defines the set of threads against which that thread competes for resources.

For example, in a scheduling decision, threads sharing scheduling contention scope compete for processor resources. In IEEE Std. 1003.1-200x, a thread has scheduling contention scope of either PTHREAD_SCOPE_SYSTEM or PTHREAD_SCOPE_PROCESS.

3.335 Scheduling Policy

A set of rules that is used to determine the order of execution of processes or threads to achieve some goal.

Note: Scheduling Policy is defined in detail in Section 4.11 (on page 125).

3.336 Screen

A rectangular region of columns and lines on a terminal display. A screen may be a portion of a physical display device or may occupy the entire physical area of the display device.

3.337 Scroll

To move the representation of data vertically or horizontally relative to the terminal screen. There are two types of scrolling:

1. The cursor moves with the data.
2. The cursor remains stationary while the data moves.

3.338 Semaphore

A minimum synchronization primitive to serve as a basis for more complex synchronization mechanisms to be defined by the application program.

Note: Semaphores are defined in detail in Section 4.13 (on page 126).

3.339 Session

A collection of process groups established for job control purposes. Each process group is a member of a session. A process is considered to be a member of the session of which its process group is a member. A newly created process joins the session of its creator. A process can alter its session membership; see *setsid*( ). There can be multiple process groups in the same session.

Note: The *setsid*( ) function is defined in detail in the System Interfaces volume of IEEE Std. 1003.1-200x.

3.340 Session Leader

A process that has created a session.

Note: For further information, see the *setsid*( ) function defined in the System Interfaces volume of IEEE Std. 1003.1-200x.

3.341 Session Lifetime

The period between when a session is created and the end of the lifetime of all the process groups that remain as members of the session.

3.342 Shared Memory Object

An object that represents memory that can be mapped concurrently into the address space of more than one process.

3.343 Shell

A program that interprets sequences of text input as commands. It may operate on an input stream or it may interactively prompt and read commands from a terminal.

3.344 Shell, the

The Shell Command Language Interpreter; a specific instance of a shell.

Note: For further information, see the *sh* utility defined in the Shell and Utilities volume of IEEE Std. 1003.1-200x.

3.345 Shell Script

A file containing shell commands. If the file is made executable, it can be executed by specifying its name as a simple command. Execution of a shell script causes a shell to execute the commands within the script. Alternatively, a shell can be requested to execute the commands in a shell script by specifying the name of the shell script as the operand to the *sh* utility.

Note: Simple Commands are defined in detail in the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.9.1, Simple Commands.

The *sh* utility is defined in detail in the Shell and Utilities volume of IEEE Std. 1003.1-200x.

3.346 Signal

A mechanism by which a process or thread may be notified of, or affected by, an event occurring in the system. Examples of such events include hardware exceptions and specific actions by processes. The term signal is also used to refer to the event itself.

3.347 Signal Stack

Memory established for a thread, in which signal handlers catching signals sent to that thread are executed.

3.348 Single-Quote

The character ''', also known as *apostrophe*.

3.349 Slash

The character '/', also known as *solidus*.

3.350 Socket

A file of a particular type that is used as a communications endpoint for process-to-process communication as described in the System Interfaces volume of IEEE Std. 1003.1-200x.

3.351 Socket Address

An address associated with a socket or remote endpoint, including an address family identifier and addressing information specific to that address family. The address may include multiple parts, such as a network address associated with a host system and an identifier for a specific endpoint.

3.352 Soft Limit

A resource limitation established for each process that the process may set to any value less than or equal to the hard limit.

3.353 Source Code

When dealing with the Shell Command Language, input to the command language interpreter. The term shell script is synonymous with this meaning.

When dealing with an ISO/IEC-conforming programming language, source code is input to a compiler conforming to that ISO/IEC standard.

Source code also refers to the input statements prepared for the following standard utilities: *awk*, *bc*, *ed*, *lex*, *localedef*, *make*, *sed*, and *yacc*.

Source code can also refer to a collection of sources meeting any or all of these meanings.

Note: The *awk*, *bc*, *ed*, *lex*, *localedef*, *make*, *sed*, and *yacc* utilities are defined in detail in the Shell and Utilities volume of IEEE Std. 1003.1-200x.

3.354 Space Character (<space>)

The character defined in the portable character set as <space>. The <space> character is a member of the **space** character class of the current locale, but represents the single character, and not all of the possible members of the class; see also Section 3.433 (on page 116).

3.355 Spawn

A process creation primitive useful for systems that have difficulty with *fork*( ) and as an efficient replacement for *fork*( )/*exec*.

3.356 Special Built-In

See *Built-In Utility* in Section 3.85 (on page 55).

3.357 Special Parameter

In the shell command language, a parameter named by a single character from the following list:

```
*   @   #   ?   !   -   $   0
```

Note: For further information, see the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.5.2, Special Parameters.

3.358 Spin Lock

A synchronization object used to allow multiple threads to serialize their access to shared data.

3.359 Sporadic Server

A scheduling policy for threads and processes that reserves a certain amount of execution capacity for processing aperiodic events at a given priority level.

3.360 Standard Error

An output stream usually intended to be used for diagnostic messages.

3.361 Standard Input

An input stream usually intended to be used for primary data input.

3.362 Standard Output

An output stream usually intended to be used for primary data output.

3.363 Standard Utilities

The utilities described in the Shell and Utilities volume of IEEE Std. 1003.1-200x.

3.364 Stream

Appearing in lowercase, a stream is a file access object that allows access to an ordered sequence of characters, as described by the ISO C standard. Such objects can be created by the *fdopen*( ), *fopen*( ), or *popen*( ) functions, and are associated with a file descriptor. A stream provides the additional services of user-selectable buffering and formatted input and output; see also Section 3.365.

Note: For further information, see the System Interfaces volume of IEEE Std. 1003.1-200x, Section 2.5, Standard I/O Streams.

The *fdopen*( ), *fopen*( ), or *popen*( ) functions are defined in detail in the System Interfaces volume of IEEE Std. 1003.1-200x.

3.365 STREAM

Appearing in uppercase, STREAM refers to a full duplex connection between a process and an open device or pseudo-device. It optionally includes one or more intermediate processing modules that are interposed between the process end of the STREAM and the device driver (or pseudo-device driver) end of the STREAM; see also Section 3.364.

Note: For further information, see the System Interfaces volume of IEEE Std. 1003.1-200x, Section 2.6, STREAMS.

3.366 STREAM End

The STREAM end is the driver end of the STREAM and is also known as the downstream end of the STREAM.

3.367 STREAM Head

The STREAM head is the beginning of the STREAM and is at the boundary between the system and the application process. This is also known as the upstream end of the STREAM.

3.368 STREAMS Multiplexor

A driver with multiple STREAMS connected to it. Multiplexing with STREAMS connected above is referred to as N-to-1, or *upper multiplexing*. Multiplexing with STREAMS connected below is referred to as 1-to-N or *lower multiplexing*.

3.369 String

A contiguous sequence of bytes terminated by and including the first null byte.

3.370 Subshell

A shell execution environment, distinguished from the main or current shell execution environment.

Note: For further information, see the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.13, Shell Execution Environment.

3.371 Successfully Transferred

For a write operation to a regular file, when the system ensures that all data written is readable on any subsequent open of the file (even one that follows a system or power failure) in the absence of a failure of the physical storage medium.

For a read operation, when an image of the data on the physical storage medium is available to the requesting process.

3.372 Supplementary Group ID

An attribute of a process used in determining file access permissions. A process has up to {NGROUPS_MAX} supplementary group IDs in addition to the effective group ID. The supplementary group IDs of a process are set to the supplementary group IDs of the parent process when the process is created.

3.373 Suspended Job

A job that has received a SIGSTOP, SIGTSTP, SIGTTIN, or SIGTTOU signal that caused the process group to stop. A suspended job is a background job, but a background job is not necessarily a suspended job.

3.374 Symbolic Link

A type of file with the property that when the file is encountered during path name resolution, a string stored by the file is used to modify the path name resolution. The stored string has a length of {SYMLINK_MAX} bytes or fewer.

Note: Path Name Resolution is defined in detail in Section 4.9 (on page 123).

3.375 Synchronized Input and Output

A determinism and robustness improvement mechanism to enhance the data input and output mechanisms, so that an application can ensure that the data being manipulated is physically present on secondary mass storage devices.

3.376 Synchronized I/O Completion

The state of an I/O operation that has either been successfully transferred or diagnosed as unsuccessful.

3.377 Synchronized I/O Data Integrity Completion

For read, when the operation has been completed or diagnosed if unsuccessful. The read is complete only when an image of the data has been successfully transferred to the requesting process. If there were any pending write requests affecting the data to be read at the time that the synchronized read operation was requested, these write requests are successfully transferred prior to reading the data.

For write, when the operation has been completed or diagnosed if unsuccessful. The write is complete only when the data specified in the write request is successfully transferred and all file system information required to retrieve the data is successfully transferred.

File attributes that are not necessary for data retrieval (access time, modification time, status change time) need not be successfully transferred prior to returning to the calling process.

3.378 Synchronized I/O File Integrity Completion

Identical to a synchronized I/O data integrity completion with the addition that all file attributes relative to the I/O operation (including access time, modification time, status change time) are successfully transferred prior to returning to the calling process.

3.379 Synchronized I/O Operation

An I/O operation performed on a file that provides the application assurance of the integrity of its data and files.

3.380 Synchronous I/O Operation

An I/O operation that causes the thread requesting the I/O to be blocked from further use of the processor until that I/O operation completes.

Note: A synchronous I/O operation does not imply synchronized I/O data integrity completion or synchronized I/O file integrity completion.

3.381 Synchronously-Generated Signal

A signal that is attributable to a specific thread.

For example, a thread executing an illegal instruction or touching invalid memory causes a synchronously-generated signal. Being synchronous is a property of how the signal was generated and not a property of the signal number.

3.382 System

An implementation of IEEE Std. 1003.1-200x.

3.383 System Crash

An interval initiated by an unspecified circumstance that causes all processes (possibly other than special system processes) to be terminated in an undefined manner, after which any changes to the state and contents of files created or written to by an application prior to the interval are undefined, except as required elsewhere in IEEE Std. 1003.1-200x.

3.384 System Console

An optional file that receives messages sent by *fmtmsg*( ) when the MM_CONSOLE flag is set.

Note: The *fmtmsg*( ) function is defined in detail in the System Interfaces volume of IEEE Std. 1003.1-200x.

3.385 System Databases

An implementation provides two system databases.

The *group database* contains the following information for each group:

1. Group name
2. Numerical group ID
3. List of all users allowed in the group

The *user database* contains the following information for each user:

1. User name
2. Numerical user ID
3. Numerical group ID
4. Initial working directory
5. Initial user program

If the initial user program field is null, the system default is used. If the initial working directory field is null, the interpretation of that field is implementation-defined. These databases may contain other fields that are unspecified by IEEE Std. 1003.1-200x.

3.386 System Documentation

All documentation provided with an implementation except for the conformance document or Conformance Statement Questionnaire (CSQ). Electronically distributed documents for an implementation are considered part of the system documentation.

3.387 System Process

An implementation-defined object, other than a process executing an application, that has a process ID.

3.388 System Reboot

An implementation-defined sequence of events that may result in the loss of transitory data; that is, data that is not saved in permanent storage. For example, message queues, shared memory, semaphores, and processes.

3.389 System Trace Event

A trace event that is generated by the implementation, in response either to a system-initiated action or to an application-requested action, except for a call to *posix_trace_event*( ). When supported by the implementation, a system-initiated action generates a process-independent system trace event and an application-requested action generates a process-dependent system trace event. For a system trace event not defined by IEEE Std. 1003.1-200x, the associated trace event type identifier is derived from the implementation-defined name for this trace event, and the associated data is of implementation-defined content and length.

3.390 System-Wide

Pertaining to events occurring in all processes existing in an implementation at a given point in time.

3.391 Tab Character (<tab>)

A character that in the output stream indicates that printing or displaying should start at the next horizontal tabulation position on the current line. The <tab> character is the character designated by `'\t'` in the C language. If the current position is at or past the last defined horizontal tabulation position, the behavior is unspecified. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the tabulation.

3.392 Terminal (or Terminal Device)

A character special file that obeys the specifications of the general terminal interface.

Note: The General Terminal Interface is defined in detail in Chapter 11 (on page 213).

3.393 Text Column

A roughly rectangular block of characters capable of being laid out side-by-side next to other text columns on an output page or terminal screen. The widths of text columns are measured in column positions.

3.394 Text File

A file that contains characters organized into one or more lines. The lines do not contain NUL characters and none can exceed {LINE_MAX} bytes in length, including the <newline> character. Although IEEE Std. 1003.1-200x does not distinguish between text files and binary files (see the ISO C standard), many utilities only produce predictable or meaningful output when operating on text files. The standard utilities that have such restrictions always specify *text files* in their STDIN or INPUT FILES sections.

3.395 Thread

A single flow of control within a process. Each thread has its own thread ID, scheduling priority and policy, *errno* value, thread-specific key/value bindings, and the required system resources to support a flow of control. Anything whose address may be determined by a thread, including but not limited to static variables, storage obtained via *malloc*(), directly addressable storage obtained through implementation-defined functions, and automatic variables, are accessible to all threads in the same process.

Note: The *malloc*() function is defined in detail in the System Interfaces volume of IEEE Std. 1003.1-200x.

3.396 Thread ID

Each thread in a process is uniquely identified during its lifetime by a value of type **pthread_t** called a thread ID.

3.397 Thread List

An ordered set of runnable threads that all have the same ordinal value for their priority.

The ordering of threads on the list is determined by a scheduling policy or policies. The set of thread lists includes all runnable threads in the system.

3.398 Thread-Safe

A function that may be safely invoked concurrently by multiple threads. Each function defined in the System Interfaces volume of IEEE Std. 1003.1-200x is thread-safe unless explicitly stated otherwise. Examples are any ‘‘pure’’ function, a function which holds a mutex locked while it is accessing static storage, or objects shared among threads.

3.399 Thread-Specific Data Key

A process global handle of type **pthread_key_t** which is used for naming thread-specific data.

Although the same key value may be used by different threads, the values bound to the key by *pthread_setspecific*( ) and accessed by *pthread_getspecific*( ) are maintained on a per-thread basis and persist for the life of the calling thread.

Note: The *pthread_getspecific*( ) and *pthread_setspecific*( ) functions are defined in detail in the System Interfaces volume of IEEE Std. 1003.1-200x.

3.400 Tilde

The character '~'.

3.401 Timeouts

A method of limiting the length of time an interface will block; see also Section 3.77 (on page 54).

3.402 Timer

A mechanism that can notify a thread when the time as measured by a particular clock has reached or passed a specified value, or when a specified amount of time has passed.

3.403 Timer Overrun

A condition that occurs each time a timer, for which there is already an expiration signal queued to the process, expires.

3.404 Token

In the shell command language, a sequence of characters that the shell considers as a single unit when reading input. A token is either an operator or a word.

Note: The rules for reading input are defined in detail in the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.3, Token Recognition.

3.405 Trace Analyzer Process

A process that extracts trace events from a trace stream to retrieve information about the behavior of an application. A trace controller process may also be a trace analyzer process. Trace analysis can be done concurrently with the traced process or can be done off-line, in the same or in a different platform.

3.406 Trace Controller Process

A process that creates a trace stream for tracing a process. Only the trace controller process has control of the trace stream it has created. The control of the operation of a trace stream is done using its corresponding trace stream identifier. The trace controller process is able to:

- Initialize the attributes of a trace stream
- Create the trace stream
- Start and stop tracing
- Know the mapping of the traced process
- If the Trace Event Filter option is supported, filter the type of trace events to be recorded
- Shut the trace stream down

A traced process may also be a trace controller process. Only the trace controller process can control its trace stream(s). A trace stream created by a trace controller process is shut down if its controller process terminates or executes another file.

3.407 Trace Event

A data object that represents an action executed by the system, and that is recorded in a trace stream. Each trace event is of a particular trace event type, and is associated with a trace event type identifier. The execution of a trace point generates a trace event if a trace stream has been created and started for the process that executed the trace point and if the corresponding trace event type identifier is not ignored by filtering.

A generated trace event should be recorded in a trace stream and optionally also in a trace log if a trace log was associated with the trace stream.

The only case in which a generated trace event is not recorded in the trace stream is when no resources are available for it in the trace stream. In this case, the trace event is lost.

The only two cases in which a generated trace event is not recorded in the trace log are when no resources are available for it in the trace log or when a flush operation does not succeed.

A trace event recorded in an active trace stream may be retrieved by an application having the appropriate privileges.

A trace event recorded in a trace log may be retrieved by an application having the appropriate privileges after opening the trace log as a pre-recorded trace stream, with the function *posix_trace_open*( ).

When a trace event is reported it is possible to retrieve the following:

- A trace event type identifier
- A timestamp
- The process ID of the traced process, if the trace event is process-dependent
- Any optional trace event data including its length
- If the Threads option is supported, the thread ID, if the trace event is process-dependent
- The program address at which the trace point was invoked

3.408 Trace Event Type

A data object type that defines a class of trace event. A trace event type is identified on the one hand by a trace event type name, also referenced as a trace event name, and on the other hand by a trace event type identifier. A trace event name is a human-readable string. A trace event type identifier is an opaque identifier used by the trace system. There is a one-to-one relationship between trace event type identifiers and trace event names for a given trace stream and also for a given traced process. The trace event type identifier is generated automatically from a trace event name by the trace system either when a trace controller process invokes *posix_trace_trid_eventid_open*( ) or when an instrumented application process invokes *posix_trace_eventid_open*( ). Trace event type identifiers are used to filter trace event types, to allow interpretation of user data, and to identify the kind of trace point that generated a trace event.

3.409 Trace Event Type Mapping

A one-to-one mapping between trace event types and trace event names. One such mapping is associated with each trace stream. An active trace stream is associated to a traced process, and also to its children if the Trace Inherit option is supported and also the inheritance policy is set to _POSIX_TRACE_INHERIT. Therefore each traced process has a mapping of the trace event names to trace event type identifiers that have been defined for that process.

3.410 Trace Filter

A filter that allows the trace controller process to specify those trace event types that are to be ignored; that is, not generated. The operation of the filter is to filter out (ignore) selected trace events. By default, no trace events are filtered.

3.411 Trace Generation Version

A data object that is an implementation-defined character string, generated by the trace system and describing the origin and version of the trace system.

3.412 Trace Log

The flushed image of a trace stream, if the trace stream is created with a trace log. The trace log is recorded when the *posix_trace_shutdown*( ) operation is invoked or during tracing, depending on the tracing strategy which is defined by a log policy. After the trace stream has been shut down, the trace information can be retrieved from the associated trace log using the same interface used to retrieve information from an active trace stream.

3.413 Trace Point

An action that may cause a trace event to be generated. This may be an implementation-defined action such as a context switch, or an application-programmed action such as a call to a specific operating system service (for example, *fork*( )) or a call to *posix_trace_event*( ).

3.414 Trace Stream

An opaque object that contains trace events plus internal data needed to interpret those trace events. The implementation and format of a trace stream are unspecified. A trace stream need not be and generally is not persistent. A trace stream may be either active or pre-recorded:

- An active trace stream is a trace stream that has been created and has not yet been shut down. It can be of one of the two following classes:
  1. An active trace stream without a trace log that was created with the *posix_trace_create*( ) function
  2. If the Trace Log option is supported, an active trace stream with a trace log that was created with the *posix_trace_create_withlog*( ) function
- A pre-recorded trace stream is a trace stream that was opened from a trace log object using the *posix_trace_open*( ) function.

An active trace stream can loop. This behavior means that when the resources allocated by the trace system for the trace stream are exhausted, the trace system reuses the resources associated with the oldest recorded trace events to record new trace events.

If the Trace Log option is supported, an active trace stream with a trace log can be flushed. This operation causes the trace system to write trace events from the trace stream to the associated trace log, following the defined policies or using an explicit function call. After this operation, the trace system may reuse the resources associated with the flushed trace events.

An active trace stream with or without a trace log can be cleared. This operation causes all the resources associated with this trace stream to be reinitialized. The trace stream behaves as if it was returning from its creation, except that the mapping of trace event type identifiers to trace event names is not cleared. If a trace log was associated with this trace stream, the trace log is also reinitialized.

3.415 Trace Stream Identifier

A handle to manage tracing operations in a trace stream.

3.416 Trace System

A system that allows both system and user trace events to be generated into a trace stream. These trace events can be retrieved later.

3.417 Traced Process

A process for which at least one trace stream has been created. A traced process is also called a target process. If the Trace Inherit option is supported and the trace stream's inheritance attribute is _POSIX_TRACE_INHERIT, the initial targeted traced process is traced together with all of its future children. The *posix_pid* member of each trace event in a trace stream is the process ID of the traced process.

3.418 Tracing Status of a Trace Stream

A status that describes the state of an active trace stream. The tracing status of a trace stream can be retrieved from the trace stream attributes. An active trace stream can be in one of two states: running or suspended.

3.419 Typed Memory Name Space

A system-wide name space that contains the names of the typed memory objects present in the system. It is configurable for a given implementation.

3.420 Typed Memory Object

A combination of a typed memory pool and a typed memory port. The entire contents of the pool are accessible from the port. The typed memory object is identified through a name that belongs to the typed memory name space.

3.421 Typed Memory Pool

An extent of memory with the same operational characteristics. Typed memory pools may be contained within each other.

3.422 Typed Memory Port

A hardware access path to one or more typed memory pools.

3.423 Unbind

Remove the association between a network address and an endpoint.

3.424 Unit Data

See *Datagram* in Section 3.126 (on page 62).

3.425 Upshifting

The conversion of a lowercase character that has a single-character uppercase representation into this uppercase representation.

3.426 User Database

A system database of implementation-defined format that contains at least the following information for each user ID:

- User name
- Numerical user ID
- Initial numerical group ID
- Initial working directory
- Initial user program

The initial numerical group ID is used by the *newgrp* utility. Any other circumstances under which the initial values are operative are implementation-defined.

If the initial user program field is null, an implementation-defined program is used.

If the initial working directory field is null, the interpretation of that field is implementation-defined.

Note: The *newgrp* utility is defined in detail in the Shell and Utilities volume of IEEE Std. 1003.1-200x.

3.427 User ID

A non-negative integer that is used to identify a system user. When the identity of a user is associated with a process, a user ID value is referred to as a real user ID, an effective user ID, or a saved set-user-ID.

3.428 User Name

A string that is used to identify a user; see also Section 3.426 (on page 114). To be portable across systems conforming to IEEE Std. 1003.1-200x, the value is composed of characters from the portable file name character set. The hyphen should not be used as the first character of a portable user name.

3.429 User Trace Event

A trace event that is generated explicitly by the application as a result of a call to *posix_trace_event*( ).

3.430 Utility

A program, excluding special built-in utilities provided as part of the Shell Command Language, that can be called by name from a shell to perform a specific task, or related set of tasks.

Note: For further information on special built-in utilities, see the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.15, Special Built-In Utilities.

3.431 Variable

In the shell command language, a named parameter.

Note: For further information, see the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.5, Parameters and Variables.

3.432 Vertical-Tab Character (<vertical-tab>)

A character that in the output stream indicates that printing should start at the next vertical tabulation position. The <vertical-tab> character is the character designated by '\v' in the C language. If the current position is at or past the last defined vertical tabulation position, the behavior is unspecified. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the tabulation.

3.433 White Space

A sequence of one or more characters that belong to the **space** character class as defined via the *LC_CTYPE* category in the current locale.

In the POSIX locale, white space consists of one or more <blank> characters (<space> and <tab> characters), <newline> characters, <carriage-return> characters, <form-feed> characters, and <vertical-tab> characters.

3.434 Wide-Character Code (C Language)

An integer value corresponding to a single graphic symbol or control code.

Note: C Language Wide-Character Codes are defined in detail in Section 6.3 (on page 137).

3.435 Wide-Character Input/Output Functions

The functions that perform wide-oriented input from streams or wide-oriented output to streams: *fgetwc*( ), *fputwc*( ), *fputws*( ), *fwprintf*( ), *fwscanf*( ), *getwc*( ), *getwchar*( ), *getws*( ), *putwc*( ), *putwchar*( ), *ungetwc*( ), *vfwprintf*( ), *vwprintf*( ), *wprintf*( ), and *wscanf*( ).

Note: These functions are defined in detail in the System Interfaces volume of IEEE Std. 1003.1-200x.

3.436 Wide-Character String

A contiguous sequence of wide-character codes terminated by and including the first null wide-character code.

3.437 Word

In the shell command language, a token other than an operator. In some cases a word is also a portion of a word token: in the various forms of parameter expansion, such as ${*name*–*word*}, and variable assignment, such as *name*=*word*, the word is the portion of the token depicted by *word*. The concept of a word is no longer applicable following word expansions—only fields remain.

Note: For further information, see the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.6.2, Parameter Expansion and the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.6, Word Expansions.

3.438 Working Directory (or Current Working Directory)

A directory, associated with a process, that is used in path name resolution for path names that do not begin with a slash.

3.439 Worldwide Portability Interface

Functions for handling characters in a codeset-independent manner.

3.440 Write

To output characters to a file, such as standard output or standard error. Unless otherwise stated, standard output is the default output destination for all uses of the term write; see the distinction between display and write in Section 3.135 (on page 64).

3.441 XSI

The X/Open System Interface is the core application programming interface for C and *sh* programming for systems conforming to the Single UNIX Specification. This is a superset of the mandatory requirements for conformance to IEEE Std. 1003.1-200x.

3.442 XSI-Conformant

A system which allows an application to be built using a set of services that are consistent across all systems that conform to IEEE Std. 1003.1-200x and that support the XSI extension.

Note: See also Chapter 2 (on page 19).

3.443 Zombie Process

A process that has terminated and that is deleted when its exit status has been reported to another process which is waiting for that process to terminate.

3.444 ±0

The algebraic sign provides additional information about any variable that has the value zero when the representation allows the sign to be determined.

CHANGE HISTORY

Issue 4

Numerous changes and additions are made for alignment with the ISO C standard and the ISO POSIX-1 standard.

Issue 4, Version 2

The following terms are added to support the adoption of additional traditional UNIX interfaces: *alternate signal stack*, *break value*, *data segment*, *driver*, *hard limit*, *host byte order*, *named STREAM*, *network byte order*, *network host database*, *network net database*, *network protocol database*, *network service database*, *pad*, *parent window*, *priority band*, *process virtual time*, *pseudo-terminal*, *real time*, *signal stack*, *socket*, *soft limit*, *STREAM* (second definition), *STREAM end*, *STREAM head*, *STREAMS multiplexor*, *symbolic link*, *system console*, and *timer*.

Issue 5

Numerous terms are added to support adoption of the POSIX Threads Extension and the POSIX Realtime Extension.

Issue 6

Additional terms are added to cover material from the ISO POSIX-1: 1996 standard and the ISO POSIX-2: 1993 standard not previously included.

Various XSI-related terms are added.

The following definitions are added for alignment with IEEE Std. 1003.1d-1999: Spawn, Timeouts, Execution Time Monitoring, Sporadic Server, Advisory Information, CPU Time, CPU-Time Clock, CPU-Time Timer, and Execution Time.

The definition of Memory Object is modified to include typed memory objects for alignment with IEEE Std. 1003.1j-2000.

Definitions of Barrier, Clock Jump, Monotonic Clock, Read-Write Lock, Spin Lock, Typed Memory Name Space, Typed Memory Object, Typed Memory Pool, and Typed Memory Port are added for alignment with IEEE Std. 1003.1j-2000.

The Read-Write Lock definition is moved under the RWL option for alignment with IEEE Std. 1003.1j-2000.

Notes to Reviewers

This section with side shading will not appear in the final copy. - Ed.

To be further expanded.

3329

Chapter 4

General Concepts

4.1 Concurrent Execution

Functions that suspend the execution of the calling thread shall not cause the execution of other threads to be indefinitely suspended.

4.2 Extended Security Controls

An implementation may provide implementation-defined extended security controls (see Section 3.161 (on page 68)). These permit an implementation to provide security mechanisms to implement different security policies than those described in IEEE Std. 1003.1-200x. These mechanisms shall not alter or override the defined semantics of any of the interfaces in IEEE Std. 1003.1-200x.

4.3 File Access Permissions

The standard file access control mechanism uses the file permission bits, as described below.

Implementations may provide *additional* or *alternate* file access control mechanisms, or both. An additional access control mechanism shall only further restrict the access permissions defined by the file permission bits. An alternate file access control mechanism shall:

- Specify file permission bits for the file owner class, file group class, and file other class of that file, corresponding to the access permissions.
- Be enabled only by explicit user action, on a per-file basis by the file owner or a user with the appropriate privilege.
- Be disabled for a file after the file permission bits are changed for that file with *chmod*( ). The disabling of the alternate mechanism need not disable any additional mechanisms supported by an implementation.

Whenever a process requests file access permission for read, write, or execute/search, if no additional mechanism denies access, access is determined as follows:

- If a process has the appropriate privilege:
  - — If read, write, or directory search permission is requested, access is granted.
  - — If execute permission is requested, access is granted if execute permission is granted to at least one user by the file permission bits or by an alternate access control mechanism; otherwise, access is denied.
- Otherwise:
  - — The file permission bits of a file contain read, write, and execute/search permissions for the file owner class, file group class, and file other class.
  - — Access is granted if an alternate access control mechanism is not enabled and the requested access permission bit is set for the class (file owner class, file group class, or file other class) to which the process belongs, or if an alternate access control mechanism is

enabled and it allows the requested access; otherwise, access is denied.

4.4 File Hierarchy

Files in the system are organized in a hierarchical structure in which all of the non-terminal nodes are directories and all of the terminal nodes are any other type of file. Because multiple directory entries may refer to the same file, the hierarchy is properly described as a *directed graph*.

4.5 File Names

For a file name to be portable across implementations conforming to IEEE Std. 1003.1-200x, it shall consist only of the Portable File Name Character Set as defined in Section 3.278 (on page 88).

The hyphen character shall not be used as the first character of a portable file name. Uppercase and lowercase letters retain their unique identities between conforming implementations. In the case of a portable path name, the slash character may also be used.

4.6 File Times Update

Each file has three distinct associated time values: *st_atime*, *st_mtime*, and *st_ctime*. The *st_atime* field is associated with the times that the file data is accessed; *st_mtime* is associated with the times that the file data is modified; and *st_ctime* is associated with the times that the file status is changed. These values are returned in the file characteristics structure, as described in **<sys/stat.h>**.

Each function or utility in IEEE Std. 1003.1-200x that reads or writes data or changes file status indicates which of the appropriate time-related fields shall be ‘‘marked for update’’. If an implementation of such a function or utility marks for update a time-related field not specified by IEEE Std. 1003.1-200x, this shall be documented, except that any changes caused by path name resolution need not be documented. For the other functions or utilities in IEEE Std. 1003.1-200x (those that are not explicitly required to read or write file data or change file status, but that in some implementations happen to do so), the effect is unspecified.

An implementation may update fields that are marked for update immediately, or it may update such fields periodically. At an update point in time, any marked fields are set to the current time and the update marks are cleared. All fields that are marked for update shall be updated when the file ceases to be open by any process, or when a *stat*( ), *fstat*( ), or *lstat*( ) is performed on the file. Other times at which updates are done are unspecified. Marks for update, and updates themselves, are not done for files on read-only file systems; see Section 3.306 (on page 93).

4.7 Measurement of Execution Time

The mechanism used to measure execution time shall be implementation-defined. The implementation shall also define to whom the CPU time that is consumed by interrupt handlers and system services on behalf of the operating system will be charged. See Section 3.120 (on page 62).

4.8 Memory Synchronization

Applications shall ensure that access to any memory location by more than one thread of control (threads or processes) is restricted such that no thread of control can read or modify a memory location while another thread of control may be modifying it. Such access is restricted using functions that synchronize thread execution and also synchronize memory with respect to other threads. The following functions synchronize memory with respect to other threads:

fork( )	*pthread_mutex_trylock*( )		
pthread_cond_broadcast( )	*pthread_mutex_unlock*( )		
pthread_cond_signal( )	*sem_post*( )		
pthread_cond_timedwait( )	*sem_trywait*( )		
pthread_cond_wait( )	*sem_wait*( )		
pthread_create( )	*wait*( )		
pthread_join( )	*waitpid*( )		
pthread_mutex_lock( )			

Notes to Reviewers

This section with side shading will not appear in the final copy. - Ed.

We need to check whether there should be any additional functions listed.

Unless explicitly stated otherwise, if one of the above functions returns an error, it is unspecified whether the invocation causes memory to be synchronized.

Applications may allow more than one thread of control to read a memory location simultaneously.

4.9 Path Name Resolution

Path name resolution is performed for a process to resolve a path name to a particular file in a file hierarchy. There may be multiple path names that resolve to the same file.

Each file name in the path name is located in the directory specified by its predecessor (for example, in the path name fragment **a/b**, file **b** is located in directory **a**). Path name resolution fails if this cannot be accomplished. If the path name begins with a slash, the predecessor of the first file name in the path name is taken to be the root directory of the process (such path names are referred to as *absolute path names*). If the path name does not begin with a slash, the predecessor of the first file name of the path name is taken to be the current working directory of the process (such path names are referred to as *relative path names*).

The interpretation of a path name component is dependent on the value of {NAME_MAX} and _POSIX_NO_TRUNC associated with the path prefix of that component. If any path name component is longer than {NAME_MAX}, the implementation shall consider this an error.

A path name that contains at least one non-slash character and that ends with one or more trailing slashes shall be resolved as if a single dot character (`'.'`) were appended to the path

name.

If a symbolic link is encountered during path name resolution, the behavior shall depend on whether the path name component is at the end of the path name and on the function being performed. If all of the following are true, then path name resolution is complete:

1. This is the last path name component of the path name.
2. The path name has no trailing slash.
3. The function is required to act on the symbolic link itself, or certain arguments direct that the function act on the symbolic link itself.

In all other cases, the system shall prefix the remaining path name, if any, with the contents of the symbolic link. If the combined length exceeds {PATH_MAX}, and the implementation considers this to be an error, *errno* shall be set to [ENAMETOOLONG] and an error indication shall be returned. Otherwise, the resolved path name shall be the resolution of the path name just created. If the resulting path name does not begin with a slash, the predecessor of the first file name of the path name is taken to be the directory containing the symbolic link.

If the system detects a loop in the path name resolution process, it shall set *errno* to [ELOOP] and return an error indication. The same may happen if during the resolution process more symbolic links were followed than the implementation allows. This implementation-defined limit shall not be smaller than {SYMLOOP_MAX}.

The special file name dot refers to the directory specified by its predecessor. The special file name dot-dot refers to the parent directory of its predecessor directory. As a special case, in the root directory, dot-dot may refer to the root directory itself.

A path name consisting of a single slash resolves to the root directory of the process. A null path name shall not be successfully resolved. A path name that begins with two successive slashes may be interpreted in an implementation-defined manner, although more than two leading slashes shall be treated as a single slash.

4.10 Process ID Reuse

A process group ID shall not be reused by the system until the process group lifetime ends.

A process ID shall not be reused by the system until the process lifetime ends. In addition, if there exists a process group whose process group ID is equal to that process ID, the process ID shall not be reused by the system until the process group lifetime ends. A process that is not a system process shall not have a process ID of 1.

4.11 Scheduling Policy

A scheduling policy affects process or thread ordering:

- When a process or thread is a running thread and it becomes a blocked thread
- When a process or thread is a running thread and it becomes a preempted thread
- When a process or thread is a blocked thread and it becomes a runnable thread
- When a running thread calls a function that can change the priority or scheduling policy of a process or thread
- In other scheduling policy-defined circumstances

Conforming implementations are required to define the manner in which each of the scheduling policies may modify the priorities or otherwise affect the ordering of processes or threads at each of the occurrences listed above. Additionally, conforming implementations define in what other circumstances and in what manner each scheduling policy may modify the priorities or affect the ordering of processes or threads.

4.12 Seconds Since the Epoch

A value that approximates the number of seconds that have elapsed since the Epoch. A Coordinated Universal Time name (specified in terms of seconds (*tm_sec*), minutes (*tm_min*), hours (*tm_hour*), days since January 1 of the year (*tm_yday*), and calendar year minus 1900 (*tm_year*)) is related to a time represented as seconds since the Epoch, according to the expression below.

If the year is <1970 or the value is negative, the relationship is undefined. If the year is ≥1970 and the value is non-negative, the value is related to a Coordinated Universal Time name according to the C-language expression, where *tm_sec*, *tm_min*, *tm_hour*, *tm_yday*, and *tm_year* are all integer types:

```
tm_sec + tm_min*60 + tm_hour*3600 + tm_yday*86400 +
    (tm_year–70)*31536000 + ((tm_year–69)/4)*86400 –
    ((tm_year–1/100)*86400 + ((tm_year+299)/400)*86400
```

Whether and how the implementation accounts for leap seconds is unspecified.

Note: The last term of the current expression adds in a day for every 4th year starting in 1973. (January 1st of each year following a leap year starting with the first leap year after 1970). The first term above subtracts a day every 100 years starting in 2001. The last term above adds a day back in every 400 years starting in 2001.

4.13 Semaphore

A minimum synchronization primitive to serve as a basis for more complex synchronization mechanisms to be defined by the application program.

For the semaphores associated with the Semaphores option, a semaphore is represented as a shareable resource that has a non-negative integral value. When the value is zero, there is a (possibly empty) set of threads awaiting the availability of the semaphore.

For the semaphores associated with the X/Open System Interface Extension (XSI), a semaphore is a positive integer (0 through 32767). The *semget*( ) function can be called to create a set or array of semaphores. A semaphore set can contain one or more semaphores up to an implementation-defined value.

Semaphore Lock Operation

An operation that is applied to a semaphore. If, prior to the operation, the value of the semaphore is zero, the semaphore lock operation shall cause the calling thread to be blocked and added to the set of threads awaiting the semaphore; otherwise, the value is decremented.

Semaphore Unlock Operation

An operation that is applied to a semaphore. If, prior to the operation, there are any threads in the set of threads awaiting the semaphore, then some thread from that set shall be removed from the set and becomes unblocked; otherwise, the semaphore value is incremented.

4.14 Thread-Safety

Refer to the System Interfaces volume of IEEE Std. 1003.1-200x, Section 2.9, Threads.

4.15 Utility

A utility program shall be either an executable file, such as might be produced by a compiler or linker system from computer source code, or a file of shell source code, directly interpreted by the shell. The program may have been produced by the user, provided by the system implementor, or acquired from an independent distributor.

The system may implement certain utilities as shell functions (see the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.9.5, Function Definition Command) or built-in utilities, but only an application that is aware of the command search order described in the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.9.1.1, Command Search and Execution or of performance characteristics can discern differences between the behavior of such a function or built-in utility and that of an executable file.

4.16 Variable Assignment

In the shell command language, a word consisting of the following parts:

varname=*value*

When used in a context where assignment is defined to occur and at no other time, the *value* (representing a word or field) shall be assigned as the value of the variable denoted by *varname*.

Note: For further information, see the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.9.1, Simple Commands.

The *varname* and *value* parts meet the requirements for a name and a word, respectively, except that they are delimited by the embedded unquoted equals-sign, in addition to other delimiters.

Note: Additional delimiters are described in the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.3, Token Recognition.

When a variable assignment is done, the variable shall be created if it did not already exist. If *value* is not specified, the variable shall be given a null value.

Note: An alternative form of variable assignment:

symbol=*value*

(where *symbol* is a valid word delimited by an equals-sign, but not a valid name) produces unspecified results. The form *symbol*=*value* is used by the KornShell *name*[*expression*]=*value* syntax.

3549

Chapter 5

File Format Notation

The STDIN, STDOUT, STDERR, INPUT FILES, and OUTPUT FILES sections of the utility descriptions use a syntax to describe the data organization within the files, when that organization is not otherwise obvious. The syntax is similar to that used by the System Interfaces volume of IEEE Std. 1003.1-200x *printf*( ) function, as described in this chapter. When used in STDIN or INPUT FILES sections of the utility descriptions, this syntax describes the format that could have been used to write the text to be read, not a format that could be used by the System Interfaces volume of IEEE Std. 1003.1-200x *scanf*( ) function to read the input file.

The description of an individual record is as follows:

"<*format*>", [<*arg1*>, <*arg2*>,..., <*argn*>]

The *format* is a character string that contains three types of objects defined below:

1. *Characters* that are not *escape sequences* or *conversion specifications*, as described below, shall be copied to the output.
2. *Escape Sequences* represent non-graphic characters.
3. *Conversion Specifications* specify the output format of each argument; (see below).

The following characters have the following special meaning in the format string:

'' (An empty character position.) Represents one or more <blank> characters.

Δ Represents exactly one <space> character.

Table 5-1 lists escape sequences and associated actions on display devices capable of the action.

Table 5-1 Escape Sequences and Associated Actions

Escape Sequence	Represents Character	Terminal Action
'\\'	backslash	Print the character '\'.
'\a'	alert	Attempts to alert the user through audible or visible notification.
'\b'	backspace	Moves the printing position to one column before the current position, unless the current position is the start of a line.
'\f'	form-feed	Moves the printing position to the initial printing position of the next logical page.
'\n'	newline	Moves the printing position to the start of the next line.
'\r'	carriage-return	Moves the printing position to the start of the current line.
'\t'	tab	Moves the printing position to the next tab position on the current line. If there are no more tab positions remaining on the line, the behavior is undefined.
'\v'	vertical-tab	Moves the printing position to the start of the next vertical tab position. If there are no more vertical tab positions left on the page, the behavior is undefined.

Each conversion specification shall be introduced by the percent-sign character ('%'). After the character '%', the following shall appear in sequence:

flags Zero or more *flags*, in any order, that modify the meaning of the conversion specification.

field width An optional string of decimal digits to specify a minimum *field width*. For an output field, if the converted value has fewer bytes than the field width, it shall be padded on the left (or right, if the left-adjustment flag ('–'), described below, has been given) to the field width.

precision Gives the minimum number of digits to appear for the *d*, *o*, *i*, *u*, *x*, or *X* conversions (the field is padded with leading zeros), the number of digits to appear after the radix character for the *e* and *f* conversions, the maximum number of significant digits for the *g* conversion; or the maximum number of bytes to be written from a string in s conversion. The precision shall take the form of a period ('.') followed by a decimal digit string; a null digit string is treated as zero.

conversion characters
A conversion character (see below) that indicates the type of conversion to be applied.

The *flag* characters and their meanings are:

– The result of the conversion shall be left-justified within the field.

+ The result of a signed conversion shall always begin with a sign ('+' or '–').

<space> If the first character of a signed conversion is not a sign, a <space> character shall be prefixed to the result. This means that if the <space> character and '+' flags both appear, the <space> character flag shall be ignored.

The value is to be converted to an alternative form. For *c*, *d*, *i*, *u*, and *s* conversions, the behavior is undefined. For *o* conversion, it shall increase the precision to force the first digit of the result to be a zero. For *x* or *X* conversion, a non-zero result has 0*x* or 0*X* prefixed to it, respectively. For *e*, *E*, *f*, *g*, and *G* conversions, the result shall always contain a radix character, even if no digits follow the radix character. For *g*

and *G* conversions, trailing zeros shall not be removed from the result as they usually are.

0 — For *d*, *i*, *o*, *u*, *x*, *X*, *e*, *E*, *f*, *g*, and *G* conversions, leading zeros (following any indication of sign or base) shall be used to pad to the field width; no space padding is performed. If the `'0'` and `'−'` flags both appear, the `'0'` flag shall be ignored. For *d*, *i*, *o*, *u*, *x*, and *X* conversions, if a precision is specified, the `'0'` flag shall be ignored. For other conversions, the behavior is undefined.

Each conversion character shall result in fetching zero or more arguments. The results are undefined if there are insufficient arguments for the format. If the format is exhausted while arguments remain, the excess arguments shall be ignored.

The *conversion characters* and their meanings are:

d,*i*,*o*,*u*,*x*,*X* — The integer argument shall be written as signed decimal (*d* or *i*), unsigned octal (*o*), unsigned decimal (*u*), or unsigned hexadecimal notation (*x* and *X*). The *d* and *i* specifiers shall convert to signed decimal in the style [−]*dddd*. The *x* conversion shall use the numbers and letters *0123456789abcdef* and the *X* conversion shall use the numbers and letters *0123456789ABCDEF*. The *precision* component of the argument shall specify the minimum number of digits to appear. If the value being converted can be represented in fewer digits than the specified minimum, it shall be expanded with leading zeros. The default precision shall be 1. The result of converting a zero value with a precision of 0 shall be no characters. If both the field width and precision are omitted, the implementation may precede, follow, or precede and follow numeric arguments of types *d*, *i*, and *u* with <blank> characters; arguments of type *o* (octal) may be preceded with leading zeros.

f — The floating point number argument shall be written in decimal notation in the style [−]*ddd*.*ddd*, where the number of digits after the radix character (shown here as a decimal point) shall be equal to the *precision* specification. The *LC_NUMERIC* locale category shall determine the radix character to use in this format. If the *precision* is omitted from the argument, six digits shall be written after the radix character; if the *precision* is explicitly 0, no radix character shall appear.

e,*E* — The floating point number argument shall be written in the style [−]*d*.*ddd*±*dd* (the symbol `'±'` indicates either a plus or minus sign), where there is one digit before the radix character (shown here as a decimal point) and the number of digits after it is equal to the precision. The *LC_NUMERIC* locale category shall determine the radix character to use in this format. When the precision is missing, six digits shall be written after the radix character; if the precision is 0, no radix character shall appear. The *E* conversion character shall produce a number with *E* instead of *e* introducing the exponent. The exponent shall always contain at least two digits. However, if the value to be written requires an exponent greater than two digits, additional exponent digits shall be written as necessary.

g,*G* — The floating point number argument shall be written in style *f* or *e* (or in style *E* in the case of a *G* conversion character), with the precision specifying the number of significant digits. The style used depends on the value converted: style *e* (or *E*) shall be used only if the exponent resulting from the conversion is less than −4 or greater than or equal to the precision. Trailing zeros are removed from the result. A radix character shall appear only if it is followed by a digit.

c — The integer argument shall be converted to an **unsigned char** and the resulting byte shall be written.

3661 *s* The argument shall be taken to be a string and bytes from the string shall be
3662 written until the end of the string or the number of bytes indicated by the *precision*
3663 specification of the argument is reached. If the precision is omitted from the
3664 argument, it shall be taken to be infinite, so all bytes up to the end of the string
3665 shall be written.

3666 % Write a '%' character; no argument is converted.

3667 In no case does a nonexistent or insufficient *field width* cause truncation of a field; if the result of
3668 a conversion is wider than the field width, the field is simply expanded to contain the conversion
3669 result. The term *field width* should not be confused with the term *precision* used in the description
3670 of %*s*.

3671 **Examples**

3672 To represent the output of a program that prints a date and time in the form Sunday, July 3,
3673 10:02, where *weekday* and *month* are strings:

3674 `"%s,Δ%sΔ%d,Δ%d:%.2d\n" <weekday>, <month>, <day>, <hour>, <min>`

3675 To show 'π' written to 5 decimal places:

3676 `"piΔ=Δ%.5f\n",<value of π>`

3677 To show an input file format consisting of five colon-separated fields:

3678 `"%s:%s:%s:%s:%s\n", <arg1>, <arg2>, <arg3>, <arg4>, <arg5>`

3679

Chapter 6

Character Set

6.1 Portable Character Set

Conforming implementations shall support one or more coded character sets. Each supported locale shall include the *portable character set*, which is the set of symbolic names for characters in Table 6-1. This is used to describe characters within the text of IEEE Std. 1003.1-200x. The first eight entries in Table 6-1 are defined in the ISO/IEC 6429:1992 standard and the rest of the characters are defined in the ISO/IEC 10646-1:1993 standard.

Table 6-1 Portable Character Set

Symbolic Name	Glyph	UCS	Description
<NUL>		<U0000>	NULL (NUL)
<alert>		<U0007>	BELL (BEL)
<backspace>		<U0008>	BACKSPACE (BS)
<tab>		<U0009>	CHARACTER TABULATION (HT)
<carriage-return>		<U000D>	CARRIAGE RETURN (CR)
<newline>		<U000A>	LINE FEED (LF)
<vertical-tab>		<U000B>	LINE TABULATION (VT)
<form-feed>		<U000C>	FORM FEED (FF)
<space>		<U0020>	SPACE
<exclamation-mark>	!	<U0021>	EXCLAMATION MARK
<quotation-mark>	"	<U0022>	QUOTATION MARK
<number-sign>	#	<U0023>	NUMBER SIGN
<dollar-sign>	$	<U0024>	DOLLAR SIGN
<percent-sign>	%	<U0025>	PERCENT SIGN
<ampersand>	&	<U0026>	AMPERSAND
<apostrophe>	'	<U0027>	APOSTROPHE
<left-parenthesis>	(	<U0028>	LEFT PARENTHESIS
<right-parenthesis>	)	<U0029>	RIGHT PARENTHESIS
<asterisk>	*	<U002A>	ASTERISK
<plus-sign>	+	<U002B>	PLUS SIGN
<comma>	,	<U002C>	COMMA
<hyphen-minus>	–	<U002D>	HYPHEN-MINUS
<hyphen>	-	<U002D>	HYPHEN-MINUS
<full-stop>	.	<U002E>	FULL STOP
<period>	.	<U002E>	FULL STOP
<slash>	/	<U002F>	SOLIDUS
<solidus>	/	<U002F>	SOLIDUS
<zero>	0	<U0030>	DIGIT ZERO
<one>	1	<U0031>	DIGIT ONE
<two>	2	<U0032>	DIGIT TWO
<three>	3	<U0033>	DIGIT THREE

Symbolic Name	Glyph	UCS	Description
<four>	4	<U0034>	DIGIT FOUR
<five>	5	<U0035>	DIGIT FIVE
<six>	6	<U0036>	DIGIT SIX
<seven>	7	<U0037>	DIGIT SEVEN
<eight>	8	<U0038>	DIGIT EIGHT
<nine>	9	<U0039>	DIGIT NINE
<colon>	:	<U003A>	COLON
<semicolon>	;	<U003B>	SEMICOLON
<less-than-sign>	<	<U003C>	LESS-THAN SIGN
<equals-sign>	=	<U003D>	EQUALS SIGN
<greater-than-sign>	>	<U003E>	GREATER-THAN SIGN
<question-mark>	?	<U003F>	QUESTION MARK
<commercial-at>	@		<U0040>
<A>	A	<U0041>	LATIN CAPITAL LETTER A
<B>	B	<U0042>	LATIN CAPITAL LETTER B
<C>	C	<U0043>	LATIN CAPITAL LETTER C
<D>	D	<U0044>	LATIN CAPITAL LETTER D
<E>	E	<U0045>	LATIN CAPITAL LETTER E
<F>	F	<U0046>	LATIN CAPITAL LETTER F
<G>	G	<U0047>	LATIN CAPITAL LETTER G
<H>	H	<U0048>	LATIN CAPITAL LETTER H
<I>	I	<U0049>	LATIN CAPITAL LETTER I
<J>	J	<U004A>	LATIN CAPITAL LETTER J
<K>	K	<U004B>	LATIN CAPITAL LETTER K
<L>	L	<U004C>	LATIN CAPITAL LETTER L
<M>	M	<U004D>	LATIN CAPITAL LETTER M
<N>	N	<U004E>	LATIN CAPITAL LETTER N
<O>	O	<U004F>	LATIN CAPITAL LETTER O
<P>	P	<U0050>	LATIN CAPITAL LETTER P
<Q>	Q	<U0051>	LATIN CAPITAL LETTER Q
<R>	R	<U0052>	LATIN CAPITAL LETTER R
<S>	S	<U0053>	LATIN CAPITAL LETTER S
<T>	T	<U0054>	LATIN CAPITAL LETTER T
<U>	U	<U0055>	LATIN CAPITAL LETTER U
<V>	V	<U0056>	LATIN CAPITAL LETTER V
<W>	W	<U0057>	LATIN CAPITAL LETTER W
<X>	X	<U0058>	LATIN CAPITAL LETTER X
<Y>	Y	<U0059>	LATIN CAPITAL LETTER Y
<Z>	Z	<U005A>	LATIN CAPITAL LETTER Z
<left-square-bracket>	[	<U005B>	LEFT SQUARE BRACKET
<backslash>	\	<U005C>	REVERSE SOLIDUS

<tilde>	~	<U007E>	TILDE

IEEE Std. 1003.1-200x uses other character names than the above, but only in an informative way; for example, in examples to illustrate the use of characters beyond the portable character set with the facilities of IEEE Std. 1003.1-200x.

Table 6-1 (on page 133) defines the characters in the portable character set and the corresponding symbolic character names used to identify each character in a character set description file. The table contains more than one symbolic character name for characters whose traditional name differs from the chosen name.

IEEE Std. 1003.1-200x places only the following requirements on the encoded values of the characters in the portable character set:

- If the encoded values associated with each member of the portable character set are not invariant across all locales supported by the implementation, the results achieved by an application accessing those locales are unspecified.
- The encoded values associated with the digits 0 to 9 shall be such that the value of each character after 0 shall be one greater than the value of the previous character.

- A null character, NUL, which has all bits set to zero, shall be in the set of characters.
- The encoded values associated with the members of the portable character set are each represented in a single byte. Moreover, if the value is stored in an object of C-language type **char**, it is guaranteed to be positive (except the NUL, which is always zero).

Conforming implementations shall support certain character and character set attributes, as defined in Section 7.2 (on page 144).

6.2 Character Encoding

The POSIX locale contains the characters in Table 6-1 (on page 133), which have the properties listed in Section 7.3.1 (on page 147). Implementations may also add other characters. In other locales, the presence, meaning, and representation of any additional characters is locale-specific.

In locales other than the POSIX locale, a character may have a state-dependent encoding. There are two types of these encodings:

- A single-shift encoding (where each character not in the initial shift state is preceded by a shift code) can be defined if each shift-code and character sequence is considered a multi-byte character. This is done using the concatenated-constant format in a character set description file, as described in Section 6.4 (on page 137). If the implementation supports a character encoding of this type, all of the standard utilities in the Shell and Utilities volume of IEEE Std. 1003.1-200x support it. Use of a single-shift encoding with any of the functions in the System Interfaces volume of IEEE Std. 1003.1-200x that do not specifically mention the effects of state-dependent encoding is implementation-defined.
- A locking-shift encoding (where the state of the character is determined by a shift code that may affect more than the single character following it) cannot be defined with the current character set description file format. Use of a locking-shift encoding with any of the standard utilities in the Shell and Utilities volume of IEEE Std. 1003.1-200x or with any of the functions in the System Interfaces volume of IEEE Std. 1003.1-200x that do not specifically mention the effects of state-dependent encoding is implementation-defined.

While in the initial shift state, all characters in the portable character set retain their usual interpretation and do not alter the shift state. The interpretation for subsequent bytes in the sequence is a function of the current shift state. A byte with all bits zero is interpreted as the null character independent of shift state. Thus a byte with all bits zero shall never occur in the second or subsequent bytes of a character.

The maximum allowable number of bytes in a character in the current locale is indicated by {MB_CUR_MAX}, defined in the **<stdlib.h>** header and by the **<mb_cur_max>** value in a character set description file; see Section 6.4 (on page 137). The implementation's maximum number of bytes in a character is defined by the C-language macro {MB_LEN_MAX}.

6.3 C Language Wide-Character Codes

In the shell, the standard utilities are written so that the encodings of characters are described by the locale's *LC_CTYPE* definition (see Section 7.3.1 (on page 147)) and there is no differentiation between characters consisting of single octets (8-bit bytes), larger bytes, or multiple bytes. However, in the C language, a differentiation is made. To ease the handling of variable length characters, the C language has introduced the concept of wide-character codes.

All wide-character codes in a given process consist of an equal number of bits. This is in contrast to characters, which can consist of a variable number of bytes. The byte or byte sequence that represents a character can also be represented as a wide-character code. Wide-character codes thus provide a uniform size for manipulating text data. A wide-character code having all bits zero is the null wide-character code (see Section 3.248 (on page 83)), and terminates wide-character strings (see Section 3.434 (on page 116)). The wide-character value for each member of the Portable Character Set equals its value when used as the lone character in an integer character constant. Wide-character codes for other characters are locale and implementation-defined. State shift bytes do not have a wide-character code representation.

6.4 Character Set Description File

Implementations shall provide a character set description file for at least one coded character set supported by the implementation. These files are referred to elsewhere in IEEE Std. 1003.1-200x as *charmap* files. It is implementation-defined whether or not users or applications can provide additional character set description files.

IEEE Std. 1003.1-200x does not require that multiple character sets or codesets be supported. Although multiple charmap files are supported, it is the responsibility of the implementation to provide the file or files; if only one is provided, only that one is accessible using the *localedef* utility's **–f** option.

Each character set description file, except those that use the ISO/IEC 10646-1:1993 standard position values as the encoding values, shall define characteristics for the coded character set and the encoding for the characters specified in Table 6-1 (on page 133), and may define encoding for additional characters supported by the implementation. Other information about the coded character set may also be in the file. Coded character set character values shall be defined using symbolic character names followed by character encoding values.

Each symbolic name specified in Table 6-1 (on page 133) shall be included in the file and shall be mapped to a unique encoding value (except for those symbolic names that are shown with identical glyphs). If the control characters commonly associated with the symbolic names in the following table are supported by the implementation, the symbolic names and their corresponding encoding values shall be included in the file. Some of the encodings associated with the symbolic names in this table may be the same as characters in the portable character set table.

Table 6-2 Control Character Set

<ACK>	<DC2>	<ENQ>	<FS>	<IS4>	<SOH>
<BEL>	<DC3>	<EOT>	<GS>	<LF>	<STX>
<BS>	<DC4>	<ESC>	<HT>	<NAK>	<SUB>
<CAN>	<DEL>	<ETB>	<IS1>	<RS>	<SYN>
<CR>	<DLE>	<ETX>	<IS2>	<SI>	<US>
<DC1>	<EM>	<FF>	<IS3>	<SO>	<VT>

The following declarations can precede the character definitions. Each consists of the symbol shown in the following list, starting in column 1, including the surrounding brackets, followed by one or more <blank> characters, followed by the value to be assigned to the symbol.

<code_set_name> The name of the coded character set for which the character set description file is defined. The characters of the name shall be taken from the set of characters with visible glyphs defined in Table 6-1 (on page 133).

<mb_cur_max> The maximum number of bytes in a multi-byte character. This defaults to 1.

<mb_cur_min> XSI An unsigned positive integer value that defines the minimum number of bytes in a character for the encoded character set. On XSI-conformant systems, **<mb_cur_min>** shall always be 1.

<escape_char> The escape character used to indicate that the characters following are interpreted in a special way, as defined later in this section. This defaults to backslash (`'\'`), which is the character glyph used in all the following text and examples, unless otherwise noted.

<comment_char> The character that, when placed in column 1 of a charmap line, is used to indicate that the line is to be ignored. The default character is the number sign (`'#'`).

The character set mapping definitions shall be all the lines immediately following an identifier line containing the string `"CHARMAP"` starting in column 1, and preceding a trailer line containing the string `"END CHARMAP"` starting in column 1. Empty lines and lines containing a **<comment_char>** in the first column shall be ignored. Each non-comment line of the character set mapping definition (that is, between the `"CHARMAP"` and `"END CHARMAP"` lines of the file) shall be in either of two forms:

```
"%s %s %s\n", <symbolic-name>, <encoding>, <comments>
```

or:

```
"%s...%s %s %s\n", <symbolic-name>, <symbolic-name>,
    <encoding>, <comments>
```

In the first format, the line in the character set mapping definition defines a single symbolic name and a corresponding encoding. A symbolic name is one or more characters from the set shown with visible glyphs in Table 6-1 (on page 133), enclosed between angle brackets. A character following an escape character is interpreted as itself; for example, the sequence `"<\\\>>"` represents the symbolic name `"\>"` enclosed between angle brackets.

In the second format, the line in the character set mapping definition defines a range of one or more symbolic names. In this form, the symbolic names shall consist of zero or more non-numeric characters from the set shown with visible glyphs in Table 6-1 (on page 133), followed by an integer formed by one or more decimal digits. Both integers shall contain the same number of digits. The characters preceding the integer shall be identical in the two symbolic names, and the integer formed by the digits in the second symbolic name shall be equal to or greater than the integer formed by the digits in the first name. This shall be interpreted as a series of symbolic names formed from the common part and each of the integers between the first and the second integer, inclusive. As an example, <j0101>...<j0104> is interpreted as the symbolic names <j0101>, <j0102>, <j0103>, and <j0104>, in that order.

A character set mapping definition line shall exist for all symbolic names specified in Table 6-1 (on page 133), and defines the coded character value that corresponds to the character glyph

indicated in the table, or the coded character value that corresponds to the control character symbolic name. If the control characters commonly associated with the symbolic names in Table 6-2 (on page 137) are supported by the implementation, the symbolic name and the corresponding encoding value shall be included in the file. Additional unique symbolic names may be included. A coded character value can be represented by more than one symbolic name.

The encoding part is expressed as one (for single-byte character values) or more concatenated decimal, octal, or hexadecimal constants in the following formats:

```
"%cd%u", <escape_char>, <decimal byte value>
"%cx%x", <escape_char>, <hexadecimal byte value>
"%c%o", <escape_char>, <octal byte value>
```

Decimal constants are represented by two or three decimal digits, preceded by the escape character and the lowercase letter 'd'; for example, "\d05", "\d97", or "\d143". Hexadecimal constants are represented by two hexadecimal digits, preceded by the escape character and the lowercase letter 'x'; for example, "\x05", "\x61", or "\x8f". Octal constants are represented by two or three octal digits, preceded by the escape character; for example, "\05", "\141", or "\217". In a portable charmap file, each constant represents an 8-bit byte. Implementations supporting other byte sizes may allow constants to represent values larger than those that can be represented in 8-bit bytes, and to allow additional digits in constants. When constants are concatenated for multi-byte character values, they shall be of the same type, and interpreted in byte order from first to last with the least significant byte of the multi-byte character specified by the last constant. The manner in which these constants are represented in the character stored in the system is implementation-defined. (This notation was chosen for reasons of portability. There is no requirement that the internal representation in the computer memory be in this same order.) Omitting bytes from a multi-byte character definition produces undefined results.

In lines defining ranges of symbolic names, the encoded value is the value for the first symbolic name in the range (the symbolic name preceding the ellipsis). Subsequent symbolic names defined by the range shall have encoding values in increasing order. For example, the line:

```
<j0101>...<j0104>  \d129\d254
```

is interpreted as:

```
<j0101>            \d129\d254
<j0102>            \d129\d255
<j0103>            \d130\d0
<j0104>            \d130\d1
```

Note that this line is interpreted as the example even on systems with bytes larger than 8 bits.

In lines defining ranges of symbolic names that also use the ISO/IEC 10646-1:1993 standard position constant values, the conversion to the target codeset encoding value shall be performed before assignment of encoding values to symbolic names.

The comment is optional.

The following declarations can follow the character set mapping definitions (after the "END CHARMAP" statement). Each shall consist of the keyword shown in the following list, starting in column 1, followed by the value(s) to be associated to the keyword, as defined below.

WIDTH An unsigned positive integer value defining the column width (see Section 3.106 (on page 59)) for the printable characters in the coded character set specified in Table 6-1 (on page 133) and Table 6-2 (on page 137).

Notes to Reviewers

This section with side shading will not appear in the final copy. - Ed.

D3, XBD, ERN 90 suggests alternative wording for the text above: "the printable characters specified between the CHARMAP and END CHARMAP statements". The current wording is as per P1003.2b. When .2b is approved, an interpretation should be filed.

Coded character set character values shall be defined using symbolic character names followed by column width values. Defining a character with more than one **WIDTH** produces undefined results. The **END WIDTH** keyword shall be used to terminate the **WIDTH** definitions. Specifying the width of a non-printable character in a **WIDTH** declaration produces undefined results.

WIDTH_DEFAULT

An unsigned positive integer value defining the default column width for any printable character not listed by one of the **WIDTH** keywords. If no **WIDTH_DEFAULT** keyword is included in the charmap, the default character width shall be 1.

Example

After the "END CHARMAP" statement, a syntax for a width definition would be:

```
WIDTH
<A> 1
<B> 1
<C>...<Z> 1
<foo1>...<foon> 2
END WIDTH
```

In this example, the numerical code point values represented by the symbols **<A>** and **<B>** are assigned a width of 1. The code point values **<C>** to **<Z>** inclusive (**<C>**, **<D>**, **<E>**, and so on) are also assigned a width of 1. Using **<A>**...**<Z>** would have required fewer lines, but the alternative was shown to demonstrate flexibility. The keyword **WIDTH_DEFAULT** could have been added as appropriate.

6.4.1 State-Dependent Character Encodings

This section addresses the use of state-dependent character encodings (that is, those in which the encoding of a character is dependent on one or more shift codes that may precede it).

A single-shift encoding (where each character not in the initial shift state is preceded by a shift code) can be defined in the charmap format if each shift-code/character sequence is considered a multi-byte character, defined using the concatenated-constant format described in Section 6.4 (on page 137). If the implementation supports a character encoding of this type, all of the standard utilities shall support it. A locking-shift encoding (where the state of the character is determined by a shift code that may affect more than the single character following it) could be defined with an extension to the charmap format described in Section 6.4 (on page 137). If the implementation supports a character encoding of this type, any of the standard utilities that describe character (*versus* byte) or text-file manipulation shall have the following characteristics:

1. The utility shall process the statefully encoded data as a concatenation of state-independent characters. The presence of redundant locking shifts shall not affect the comparison of two statefully encoded strings.

4033 2. A utility that divides, truncates, or extracts substrings from statefully encoded data shall
4034 produce output that contains locking shifts at the beginning or end of the resulting data, if
4035 appropriate, to retain correct state information.

4036

Chapter 7

Locale

7.1 General

A *locale* is the definition of the subset of a user's environment that depends on language and cultural conventions. It is made up from one or more categories. Each category is identified by its name and controls specific aspects of the behavior of components of the system. Category names correspond to the following environment variable names:

LC_CTYPE Character classification and case conversion.

LC_COLLATE Collation order.

LC_TIME Date and time formats.

LC_NUMERIC Numeric, non-monetary formatting.

LC_MONETARY Monetary formatting.

LC_MESSAGES Formats of informative and diagnostic messages and interactive responses.

The standard utilities in the Shell and Utilities volume of IEEE Std. 1003.1-200x shall base their behavior on the current locale, as defined in the ENVIRONMENT VARIABLES section for each utility. The behavior of some of the C-language functions defined in the System Interfaces volume of IEEE Std. 1003.1-200x shall also be modified based on the current locale, as defined by the last call to *setlocale*( ).

Locales other than those supplied by the implementation can be created via the *localedef* utility, provided that the _POSIX2_LOCALEDEF symbol is defined on the system. Even if *localedef* is not provided, all implementations conforming to the System Interfaces volume of IEEE Std. 1003.1-200x shall provide one or more locales that behave as described in this chapter. The input to the utility is described in Section 7.3 (on page 145). The value that is used to specify a locale when using environment variables shall be the string specified as the *name* operand to the *localedef* utility when the locale was created. The strings `"C"` and `"POSIX"` are reserved as identifiers for the POSIX locale (see Section 7.2 (on page 144)). When the value of a locale environment variable begins with a slash (`'/'`), it is interpreted as the path name of the locale definition; the type of file (regular, directory, and so on) used to store the locale definition is implementation-defined. If the value does not begin with a slash, the mechanism used to locate the locale is implementation-defined.

If different character sets are used by the locale categories, the results achieved by an application utilizing these categories are undefined. Likewise, if different codesets are used for the data being processed by interfaces whose behavior is dependent on the current locale, or the codeset is different from the codeset assumed when the locale was created, the result is also undefined.

Applications can select the desired locale by invoking the *setlocale*( ) function (or equivalent) with the appropriate value. If the function is invoked with an empty string, such as:

```
setlocale(LC_ALL, "");
```

the value of the corresponding environment variable is used. If the environment variable is unset or is set to the empty string, the implementation shall set the appropriate environment as defined in Chapter 8 (on page 187).

7.2 POSIX Locale

Conforming systems shall provide a *POSIX locale*, also known as the C locale. The behavior of standard utilities and functions in the POSIX locale shall be as if the locale was defined via the *localedef* utility with input data from the POSIX locale tables in Section 7.3 (on page 145).

The tables in Section 7.3 (on page 145) describe the characteristics and behavior of the POSIX locale for data consisting entirely of characters from the portable character set and the control character set. For other characters, the behavior is unspecified. For C-language programs, the POSIX locale is the default locale when the *setlocale*( ) function is not called.

The POSIX locale can be specified by assigning to the appropriate environment variables the values `"C"` or `"POSIX"`.

All implementations shall define a locale as the default locale, to be invoked when no environment variables are set, or set to the empty string. This default locale can be the POSIX locale or any other implementation-defined locale. Some implementations may provide facilities for local installation administrators to set the default locale, customizing it for each location. IEEE Std. 1003.1-200x does not require such a facility.

7.3 Locale Definition

The capability to specify additional locales to those provided by an implementation is optional, denoted by the _POSIX2_LOCALEDEF symbol. If the option is not supported, only implementation-supplied locales are available.

Locales can be described with the file format presented in this section. The file format is that accepted by the *localedef* utility. For the purposes of this section, the file is referred to as the *locale definition file*, but no locales shall be affected by this file unless it is processed by *localedef* or some similar mechanism. Any requirements in this section imposed upon the utility shall apply to *localedef* or to any other similar utility used to install locale information using the locale definition file format described here.

The locale definition file shall contain one or more locale category source definitions, and shall not contain more than one definition for the same locale category. If the file contains source definitions for more than one category, implementation-defined categories, if present, shall appear after the categories defined by Section 7.1 (on page 143). A category source definition contains either the definition of a category or a **copy** directive. For a description of the **copy** directive, see *localedef*. In the event that some of the information for a locale category, as specified in this volume of IEEE Std. 1003.1-200x, is missing from the locale source definition, the behavior of that category, if it is referenced, is unspecified.

A category source definition consists of a category header, a category body, and a category trailer. A category header consists of the character string naming of the category, beginning with the characters *LC_*. The category trailer consists of the string "END", followed by one or more <blank> characters and the string used in the corresponding category header.

The category body consists of one or more lines of text. Each line contains an identifier, optionally followed by one or more operands. Identifiers are either keywords, identifying a particular locale element, or collating elements. In addition to the keywords defined in this volume of IEEE Std. 1003.1-200x, the source can contain implementation-defined keywords. Each keyword within a locale has a unique name (that is, two categories cannot have a commonly-named keyword); no keyword can start with the characters *LC_*. Identifiers are separated from the operands by one or more <blank> characters.

Operands shall be characters, collating elements, or strings of characters. Strings are enclosed in double-quotes. Literal double-quotes within strings are preceded by the *<escape character>*, described below. When a keyword is followed by more than one operand, the operands are separated by semicolons; <blank> characters are allowed both before and after a semicolon.

The first category header in the file can be preceded by a line modifying the comment character. It shall have the following format, starting in column 1:

"comment_char %c\n", *<comment character>*

The comment character defaults to the number sign ('#'). Blank lines and lines containing the *<comment character>* in the first position are ignored.

The first category header in the file can be preceded by a line modifying the escape character to be used in the file. It shall have the following format, starting in column 1:

"escape_char %c\n", *<escape character>*

The escape character defaults to backslash, which is the character used in all examples shown in this volume of IEEE Std. 1003.1-200x.

A line can be continued by placing an escape character as the last character on the line; this continuation character is discarded from the input. Although the implementation need not accept any one portion of a continued line with a length exceeding {LINE_MAX} bytes, it shall

4137 place no limits on the accumulated length of the continued line. Comment lines cannot be
4138 continued on a subsequent line using an escaped newline character.

4139 Individual characters, characters in strings, and collating elements shall be represented using
4140 symbolic names, as defined below. In addition, characters can be represented using the
4141 characters themselves or as octal, hexadecimal, or decimal constants. When non-symbolic
4142 notation is used, the resultant locale definitions are in many cases not portable between systems.
4143 The left angle bracket (`'<'`) is a reserved symbol, denoting the start of a symbolic name; when
4144 used to represent itself it shall be preceded by the escape character. The following rules apply to
4145 character representation:

4146 1. A character can be represented via a symbolic name, enclosed within angle brackets `'<'`
4147 and `'>'`. The symbolic name, including the angle brackets, shall exactly match a symbolic
4148 name defined in the charmap file specified via the *localedef* **–f** option, and it shall be
4149 replaced by a character value determined from the value associated with the symbolic
4150 name in the charmap file. The use of a symbolic name not found in the charmap file shall
4151 constitute an error, unless the category is *LC_CTYPE* or *LC_COLLATE*, in which case it
4152 shall constitute a warning condition (see *localedef* for a description of action resulting from
4153 errors and warnings). The specification of a symbolic name in a **collating-element** or
4154 **collating-symbol** section that duplicates a symbolic name in the charmap file (if present)
4155 shall be an error. Use of the escape character or a right angle bracket within a symbolic
4156 name is invalid unless the character is preceded by the escape character.

4157 For example:

4158 ```
<c>;<c–cedilla> "<M><a><y>"
```

4159 2. A character in the portable character set can be represented by the character itself, in which
4160 case the value of the character is implementation-defined. (Implementations may allow |
4161 other characters to be represented as themselves, but such locale definitions are not |
4162 portable.) Within a string, the double-quote character, the escape character, and the right
4163 angle bracket character shall be escaped (preceded by the escape character) to be
4164 interpreted as the character itself. Outside strings, the characters:

4165 ```
,    ;    <    >    escape_char
```

4166 shall be escaped to be interpreted as the character itself.

4167 For example:

4168 ```
c   β   "May"
```

4169 3. A character can be represented as an octal constant. An octal constant is specified as the |
4170 escape character followed by two or three octal digits. Each constant represents a byte |
4171 value. Multi-byte values can be represented by concatenated constants specified in byte
4172 order with the last constant specifying the least significant byte of the character.

4173 For example:

4174 ```
\143;\347;\143\150   "\115\141\171"
```

4175 4. A character can be represented as a hexadecimal constant. A hexadecimal constant shall be
4176 specified as the escape character followed by an `'x'` followed by two hexadecimal digits. |
4177 Each constant shall represent a byte value. Multi-byte values can be represented by |
4178 concatenated constants specified in byte order with the last constant specifying the least |
4179 significant byte of the character. |

4180 For example:

```
\x63;\xe7;\x63\x68    "\x4d\x61\x79"
```

5. A character can be represented as a decimal constant. A decimal constant shall be specified as the escape character followed by a `'d'` followed by two or three decimal digits. Each constant represents a byte value. Multi-byte values can be represented by concatenated constants specified in byte order with the last constant specifying the least significant byte of the character.

   For example:

   ```
   \d99;\d231;\d99\d104  "\d77\d97\d121"
   ```

Implementations supporting other byte sizes may allow constants to represent values larger than those that can be represented in 8-bit bytes, and to allow additional digits in constants.

Implementations may accept single-digit octal, decimal, or hexadecimal constants following the escape character. Only characters existing in the character set for which the locale definition is created can be specified, whether using symbolic names, the characters themselves, or octal, decimal, or hexadecimal constants. If a charmap file is present, only characters defined in the charmap can be specified using octal, decimal, or hexadecimal constants. Symbolic names not present in the charmap file can be specified and shall be ignored, as specified under item 1 above.

7.3.1 LC_CTYPE

The *LC_CTYPE* category shall define character classification, case conversion, and other character attributes. In addition, a series of characters can be represented by three adjacent periods representing an ellipsis symbol ("`...`"). The ellipsis specification shall be interpreted as meaning that all values between the values preceding and following it represent valid characters. The ellipsis specification is valid only within a single encoded character set; that is, within a group of characters of the same size. An ellipsis shall be interpreted as including in the list all characters with an encoded value higher than the encoded value of the character preceding the ellipsis and lower than the encoded value of the character following the ellipsis.

For example:

```
\x30;...;\x39;
```

includes in the character class all characters with encoded values between the endpoints.

The following keywords shall be recognized. In the descriptions, the term ‘‘automatically included’’ means that it shall not be an error either to include or omit any of the referenced characters; the implementation provides them if missing (even if the entire keyword is missing) and accepts them silently if present. When the implementation automatically includes a missing character, it shall have an encoded value dependent on the charmap file in effect (see the description of the *localedef* **–f** option); otherwise, it has a value derived from an implementation-defined character mapping.

The character classes **digit**, **xdigit**, **lower**, **upper**, and **space** have a set of automatically included characters. These only need to be specified if the character values (that is, encoding) differ from the implementation default values. It is not possible to define a locale without these automatically included characters unless some implementation extension is used to prevent their inclusion. Such a definition would not be a proper superset of the C or POSIX locale and thus, it might not be possible for conforming applications to work properly.

copy Specify the name of an existing locale to be used as the definition of this category. If this keyword is specified, no other keyword can be specified.

upper Define characters to be classified as uppercase letters.

In the POSIX locale, the 26 uppercase letters are included:

```
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
```

In a locale definition file, no character specified for the keywords **cntrl**, **digit**, **punct**, or **space** can be specified. The uppercase letters <A> to <Z>, as defined in Section 6.4 (on page 137) (the portable character set), are automatically included in this class.

lower Define characters to be classified as lowercase letters.

In the POSIX locale, the 26 lowercase letters are included:

```
a b c d e f g h i j k l m n o p q r s t u v w x y z
```

In a locale definition file, no character specified for the keywords **cntrl**, **digit**, **punct**, or **space** can be specified. The lowercase letters <a> to <z> of the portable character set are automatically included in this class.

alpha Define characters to be classified as letters.

In the POSIX locale, all characters in the classes **upper** and **lower** are included.

In a locale definition file, no character specified for the keywords **cntrl**, **digit**, **punct**, or **space** can be specified. Characters classified as either **upper** or **lower** are automatically included in this class.

digit Define the characters to be classified as numeric digits.

In the POSIX locale, only:

```
0 1 2 3 4 5 6 7 8 9
```

are included.

In a locale definition file, only the digits <zero>, <one>, <two>, <three>, <four>, <five>, <six>, <seven>, <eight>, and <nine> can be specified, and in contiguous ascending sequence by numerical value. The digits <zero> to <nine> of the portable character set are automatically included in this class.

The definition of character class **digit** requires that only ten characters—the ones defining digits—can be specified; alternative digits (for example, Hindi or Kanji) cannot be specified here. However, the encoding may vary if an implementation supports more than one encoding.

alnum Define characters to be classified as letters and numeric digits. Only the characters specified for the **alpha** and **digit** keywords shall be specified. Characters specified for the keywords **alpha** and **digit** are automatically included in this class.

space Define characters to be classified as white-space characters.

In the POSIX locale, at a minimum, the characters <space>, <form-feed>, <newline>, <carriage-return>, <tab>, and <vertical-tab> are included.

In a locale definition file, no character specified for the keywords **upper**, **lower**, **alpha**, **digit**, **graph**, or **xdigit** can be specified. The characters <space>, <form-feed>, <newline>, <carriage-return>, <tab>, and <vertical-tab> of the portable character set, and any characters included in the class **blank** are automatically included in this class.

cntrl Define characters to be classified as control characters.

In the POSIX locale, no characters in classes **alpha** or **print** are included.

In a locale definition file, no character specified for the keywords **upper**, **lower**, **alpha**, **digit**, **punct**, **graph**, **print**, or **xdigit** can be specified.

punct Define characters to be classified as punctuation characters.

In the POSIX locale, neither the <space> character nor any characters in classes **alpha**, **digit**, or **cntrl** are included.

In a locale definition file, no character specified for the keywords **upper**, **lower**, **alpha**, **digit**, **cntrl**, **xdigit**, or as the <space> character can be specified.

graph Define characters to be classified as printable characters, not including the <space> character.

In the POSIX locale, all characters in classes **alpha**, **digit**, and **punct** are included; no characters in class **cntrl** are included.

In a locale definition file, characters specified for the keywords **upper**, **lower**, **alpha**, **digit**, **xdigit**, and **punct** are automatically included in this class. No character specified for the keyword **cntrl** can be specified.

print Define characters to be classified as printable characters, including the <space> character.

In the POSIX locale, all characters in class **graph** are included; no characters in class **cntrl** are included.

In a locale definition file, characters specified for the keywords **upper**, **lower**, **alpha**, **digit**, **xdigit**, **punct, graph**, and the <space> character are automatically included in this class. No character specified for the keyword **cntrl** can be specified.

xdigit Define the characters to be classified as hexadecimal digits.

In the POSIX locale, only:

```
0 1 2 3 4 5 6 7 8 9 A B C D E F a b c d e f
```

are included.

In a locale definition file, only the characters defined for the class **digit** can be specified, in contiguous ascending sequence by numerical value, followed by one or more sets of six characters representing the hexadecimal digits 10 to 15 inclusive, with each set in ascending order (for example, <A>, <B>, <C>, <D>, <E>, <F>, <a>, <b>, <c>, <d>, <e>, <f>). The digits <zero> to <nine>, the uppercase letters <A> to <F>, and the lowercase letters <a> to <f> of the portable character set are automatically included in this class.

The definition of character class **xdigit** requires that the characters included in character class **digit** be included here also.

blank Define characters to be classified as <blank> characters.

In the POSIX locale, only the <space> and <tab> characters are included.

In a locale definition file, the characters <space> and <tab> are automatically included in this class.

charclass Define one or more locale-specific character class names as strings separated by semicolons. Each named character class can then be defined subsequently in the *LC_CTYPE* definition. A character class name consists of at least one and at most {CHARCLASS_NAME_MAX} bytes of alphanumeric characters from the portable file name character set. The first character of a character class name cannot be a digit. The name cannot match any of the *LC_CTYPE* keywords defined in this volume of IEEE Std. 1003.1-200x. Future revisions of IEEE Std. 1003.1-200x will not specify any *LC_CTYPE* keywords containing uppercase letters.

charclass-name Define characters to be classified as belonging to the named locale-specific character class. In the POSIX locale, the locale-specific named character classes need not exist.

If a class name is defined by a **charclass** keyword, but no characters are subsequently assigned to it, this is not an error; it represents a class without any characters belonging to it.

The *charclass-name* can be used as the *property* argument to the *wctype*( ) function, in regular expression and shell pattern-matching bracket expressions, and by the *tr* command.

toupper Define the mapping of lowercase letters to uppercase letters.

In the POSIX locale, at a minimum, the 26 lowercase characters:

```
a b c d e f g h i j k l m n o p q r s t u v w x y z
```

are mapped to the corresponding 26 uppercase characters:

```
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
```

In a locale definition file, the operand consists of character pairs, separated by semicolons. The characters in each character pair are separated by a comma and the pair enclosed by parentheses. The first character in each pair is the lowercase letter, the second the corresponding uppercase letter. Only characters specified for the keywords **lower** and **upper** can be specified. The lowercase letters <a> to <z>, and their corresponding uppercase letters <A> to <Z>, of the portable character set are automatically included in this mapping, but only when the **toupper** keyword is omitted from the locale definition.

tolower Define the mapping of uppercase letters to lowercase letters.

In the POSIX locale, at a minimum, the 26 uppercase characters:

```
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
```

are mapped to the corresponding 26 lowercase characters:

```
a b c d e f g h i j k l m n o p q r s t u v w x y z
```

In a locale definition file, the operand consists of character pairs, separated by semicolons. The characters in each character pair are separated by a comma and the pair enclosed by parentheses. The first character in each pair is the uppercase letter, the second the corresponding lowercase letter. Only characters specified for the keywords **lower** and **upper** can be specified. If the **tolower** keyword is omitted from the locale definition, the mapping is the reverse mapping of the one specified for **toupper**.

The following table shows the character class combinations allowed:

Table 7-1 Valid Character Class Combinations

	Can Also Belong To										
In Class	**upper**	**lower**	**alpha**	**digit**	**space**	**cntrl**	**punct**	**graph**	**print**	**xdigit**	**blank**
upper		—	A	x	x	x	x	A	A	—	x
lower	—		A	x	x	x	x	A	A	—	x
alpha	—	—		x	x	x	x	A	A	—	x
digit	x	x	x		x	x	x	A	A	A	x
space	x	x	x	x		—	*	*	*	x	—
cntrl	x	x	x	x	—		x	x	x	x	—
punct	x	x	x	x	—	x		A	A	x	—
graph	—	—	—	—	—	x	—		A	—	—
print	—	—	—	—	—	x	—	—		—	—
xdigit	—	—	—	—	x	x	x	A	A		x
blank	x	x	x	x	A	—	*	*	*	x	

Notes:

1. Explanation of codes:

   A Automatically included; see text.

   — Permitted.

   x Mutually-exclusive.

   * See note 2.

2. The <space> character, which is part of the **space** and **blank** classes, cannot belong to **punct** or **graph**, but automatically belongs to the **print** class. Other **space** or **blank** characters can be classified as any of **punct**, **graph**, or **print**.

The character classifications for the POSIX locale follow; the code listing depicting the *localedef* input, the table representing the same information, sorted by character.

```
LC_CTYPE

7.3.2 LC_COLLATE

The *LC_COLLATE* category provides a collation sequence definition for numerous utilities in the Shell and Utilities volume of IEEE Std. 1003.1-200x (*sort*, *uniq*, and so on), regular expression matching (see Chapter 9 (on page 195)) and the *strcoll*( ), *strxfrm*( ), *wcscoll*( ), and *wcsxfrm*( ) functions in the System Interfaces volume of IEEE Std. 1003.1-200x.

A collation sequence definition shall define the relative order between collating elements (characters and multi-character collating elements) in the locale. This order is expressed in terms of collation values; that is, by assigning each element one or more collation values (also known as collation weights). This does not imply that implementations shall assign such values, but that ordering of strings using the resultant collation definition in the locale behaves as if such assignment is done and used in the collation process. At least the following capabilities are provided:

1. **Multi-character collating elements**. Specification of multi-character collating elements (that is, sequences of two or more characters to be collated as an entity).

2. **User-defined ordering of collating elements**. Each collating element shall be assigned a collation value defining its order in the character (or basic) collation sequence. This ordering is used by regular expressions and pattern matching and, unless collation weights are explicitly specified, also as the collation weight to be used in sorting.
3. **Multiple weights and equivalence classes**. Collating elements can be assigned one or more (up to the limit {COLL_WEIGHTS_MAX}, as defined in **<limits.h>**) collating weights for use in sorting. The first weight is hereafter referred to as the primary weight.
4. **One-to-many mapping**. A single character is mapped into a string of collating elements.
5. **Equivalence class definition**. Two or more collating elements have the same collation value (primary weight).
6. **Ordering by weights**. When two strings are compared to determine their relative order, the two strings are first broken up into a series of collating elements; the elements in each successive pair of elements are then compared according to the relative primary weights for the elements. If equal, and more than one weight has been assigned, then the pairs of collating elements are recompared according to the relative subsequent weights, until either a pair of collating elements compare unequal or the weights are exhausted.

The following keywords shall be recognized in a collation sequence definition. They are described in detail in the following sections.

copy	Specify the name of an existing locale to be used as the definition of this category. If this keyword is specified, no other keyword can be specified.
collating-element	Define a collating-element symbol representing a multi-character collating element. This keyword is optional.
collating-symbol	Define a collating symbol for use in collation order statements. This keyword is optional.
order_start	Define collation rules. This statement is followed by one or more collation order statements, assigning character collation values and collation weights to collating elements.
order_end	Specify the end of the collation-order statements.

7.3.2.1 The collating-element Keyword

In addition to the collating elements in the character set, the **collating-element** keyword can be used to define multi-character collating elements. The syntax is as follows:

```
"collating-element %s from \"%s\"\n", <collating-symbol>, <string>
```

The <*collating-symbol*> operand shall be a symbolic name, enclosed between angle brackets (`'<'` and `'>'`), and shall not duplicate any symbolic name in the current charmap file (if any), or any other symbolic name defined in this collation definition. The string operand is a string of two or more characters that collates as an entity. A <*collating-element*> defined via this keyword is only recognized with the *LC_COLLATE* category.

For example:

```
collating-element <ch> from "<c><h>"
collating-element <e-acute> from "<acute><e>"
collating-element <ll> from "ll"
```

4619 *7.3.2.2 The collating-symbol Keyword*

4620 This keyword can be used to define symbols for use in collation sequence statements; that is,
4621 between the **order_start** and the **order_end** keywords. The syntax is as follows:

4622 `"collating-symbol %s\n", <collating-symbol>`

4623 The <*collating-symbol*> shall be a symbolic name, enclosed between angle brackets (’<’ and
4624 ’>’), and shall not duplicate any symbolic name in the current charmap file (if any), or any
4625 other symbolic name defined in this collation definition. A <*collating-symbol*> defined via this
4626 keyword is only recognized with the *LC_COLLATE* category.

4627 For example:

```
4628 collating-symbol <UPPER_CASE>
4629 collating-symbol <HIGH>
```

4630 The **collating-symbol** keyword defines a symbolic name that can be associated with a relative
4631 position in the character order sequence. While such a symbolic name does not represent any
4632 collating element, it can be used as a weight.

4633 *7.3.2.3 The order_start Keyword*

4634 The **order_start** keyword shall precede collation order entries and also define the number of
4635 weights for this collation sequence definition and other collation rules.

4636 The syntax of the **order_start** keyword is as follows:

4637 `"order_start %s;%s;...;%s\n", <sort-rules>, <sort-rules> ...`

4638 The operands to the **order_start** keyword are optional. If present, the operands define rules to be
4639 applied when strings are compared. The number of operands define how many weights each
4640 element is assigned; if no operands are present, one **forward** operand is assumed. If present, the
4641 first operand defines rules to be applied when comparing strings using the first (primary)
4642 weight; the second when comparing strings using the second weight, and so on. Operands shall
4643 be separated by semicolons (’;’). Each operand shall consist of one or more collation
4644 directives, separated by commas (’,’). If the number of operands exceeds the
4645 {COLL_WEIGHTS_MAX} limit, the utility shall issue a warning message. The following
4646 directives shall be supported:

4647 **forward** Specifies that comparison operations for the weight level shall proceed from start
4648 of string towards the end of string.

4649 **backward** Specifies that comparison operations for the weight level shall proceed from end of
4650 string towards the beginning of string.

4651 **position** Specifies that comparison operations for the weight level shall consider the relative
4652 position of elements in the strings not subject to **IGNORE**. The string containing
4653 an element not subject to **IGNORE** after the fewest collating elements subject to
4654 **IGNORE** from the start of the compare collates first. If both strings contain a
4655 character not subject to **IGNORE** in the same relative position, the collating values
4656 assigned to the elements shall determine the ordering. In case of equality,
4657 subsequent characters not subject to **IGNORE** are considered in the same manner.

4658 The directives **forward** and **backward** are mutually-exclusive.

4659 For example:

```
4660 order_start    forward;backward
```

4661 If no operands are specified, a single **forward** operand shall be assumed.

4662 The character (and collating element) order is defined by the order in which characters and
4663 elements are specified between the **order_start** and **order_end** keywords. This character order is
4664 used in range expressions in regular expressions (see Chapter 9). Weights assigned to the
4665 characters and elements define the collation sequence; in the absence of weights, the character
4666 order is also the collation sequence.

4667 The **position** keyword provides the capability to consider, in a compare, the relative position of
4668 characters not subject to **IGNORE**. As an example, consider the two strings `"o-ring"` and
4669 `"or-ing"`. Assuming the hyphen is subject to **IGNORE** on the first pass, the two strings
4670 compare equal, and the position of the hyphen is immaterial. On second pass, all characters
4671 except the hyphen are subject to **IGNORE**, and in the normal case the two strings would again
4672 compare equal. By taking position into account, the first collates before the second.

4673 *7.3.2.4 Collation Order*

4674 The **order_start** keyword shall be followed by collating identifier entries. The syntax for the
4675 collating element entries is as follows:

4676 `"%s %s;%s;...;%s\n", <collating-identifier>, <weight>, <weight>, ...`

4677 Each *collating-identifier* shall consist of either a character (in any of the forms defined in Section
4678 7.3 (on page 145)), a <*collating-element*>, a <*collating-symbol*>, an ellipsis, or the special symbol
4679 **UNDEFINED**. The order in which collating elements are specified determines the character
4680 order sequence, such that each collating element shall compare less than the elements following
4681 it.

4682 A <*collating-element*> shall be used to specify multi-character collating elements, and indicates
4683 that the character sequence specified via the <*collating-element*> is to be collated as a unit and in
4684 the relative order specified by its place.

4685 A <*collating-symbol*> can be used to define a position in the relative order for use in weights. No
4686 weights can be specified with a <*collating-symbol*>.

4687 The ellipsis symbol specifies that a sequence of characters collates according to their encoded
4688 character values. It shall be interpreted as indicating that all characters with a coded character
4689 set value higher than the value of the character in the preceding line, and lower than the coded
4690 character set value for the character in the following line, in the current coded character set, shall
4691 be placed in the character collation order between the previous and the following character in
4692 ascending order according to their coded character set values. An initial ellipsis shall be
4693 interpreted as if the preceding line specified the NUL character, and a trailing ellipsis as if the
4694 following line specified the highest coded character set value in the current coded character set.
4695 An ellipsis shall be treated as invalid if the preceding or following lines do not specify characters
4696 in the current coded character set. The use of the ellipsis symbol ties the definition to a specific
4697 coded character set and may preclude the definition from being portable between
4698 implementations.

4699 The symbol **UNDEFINED** shall be interpreted as including all coded character set values not
4700 specified explicitly or via the ellipsis symbol. Such characters shall be inserted in the character
4701 collation order at the point indicated by the symbol, and in ascending order according to their
4702 coded character set values. If no **UNDEFINED** symbol is specified, and the current coded
4703 character set contains characters not specified in this section, the utility shall issue a warning
4704 message and place such characters at the end of the character collation order.

4705 The optional operands for each collation-element shall be used to define the primary, secondary,
4706 or subsequent weights for the collating element. The first operand specifies the relative primary

4707 weight, the second the relative secondary weight, and so on. Two or more collation-elements can
4708 be assigned the same weight; they belong to the same *equivalence class* if they have the same
4709 primary weight. Collation shall behave as if, for each weight level, elements subject to **IGNORE**
4710 are removed, unless the **position** collation directive is specified for the corresponding level with
4711 the **order_start** keyword. Then each successive pair of elements shall be compared according to
4712 the relative weights for the elements. If the two strings compare equal, the process is repeated
4713 for the next weight level, up to the limit {COLL_WEIGHTS_MAX}.

4714 Weights shall be expressed as characters (in any of the forms specified in Section 7.3 (on page
4715 145)), <*collating-symbol*>s, <*collating-element*>s, an ellipsis, or the special symbol **IGNORE**. A
4716 single character, a <*collating-symbol*>, or a <*collating-element*> shall represent the relative position
4717 in the character collating sequence of the character or symbol, rather than the character or
4718 characters themselves. Thus, rather than assigning absolute values to weights, a particular
4719 weight is expressed using the relative order value assigned to a collating element based on its
4720 order in the character collation sequence.

4721 One-to-many mapping is indicated by specifying two or more concatenated characters or
4722 symbolic names. For example, if the character <eszet> is given the string `"<s><s>"` as a weight,
4723 comparisons are performed as if all occurrences of the character <eszet> are replaced by
4724 `"<s><s>"` (assuming that `"<s>"` has the collating weight `"<s>"`). If it is necessary to define
4725 <eszet> and `"<s><s>"` as an equivalence class, then a collating element must be defined for the
4726 string `"ss"`.

4727 All characters specified via an ellipsis shall by default be assigned unique weights, equal to the
4728 relative order of characters. Characters specified via an explicit or implicit **UNDEFINED** special
4729 symbol shall by default be assigned the same primary weight (that is, they belong to the same
4730 equivalence class). An ellipsis symbol as a weight shall be interpreted to mean that each
4731 character in the sequence has unique weights, equal to the relative order of their character in the
4732 character collation sequence. The use of the ellipsis as a weight shall be treated as an error if the
4733 collating element is neither an ellipsis nor the special symbol **UNDEFINED**.

4734 The special keyword **IGNORE** as a weight shall indicate that when strings are compared using
4735 the weights at the level where **IGNORE** is specified, the collating element shall be ignored; that
4736 is, as if the string did not contain the collating element. In regular expressions and pattern
4737 matching, all characters that are subject to **IGNORE** in their primary weight form an
4738 equivalence class.

4739 An empty operand shall be interpreted as the collating element itself.

4740 For example, the order statement:

4741 ```
<a>   <a>;<a>
```

4742 is equal to:

4743 ```
<a>
```

4744 An ellipsis can be used as an operand if the collating element was an ellipsis, and shall be
4745 interpreted as the value of each character defined by the ellipsis.

4746 The collation order as defined in this section defines the interpretation of bracket expressions in
4747 regular expressions (see Section 9.3.5 (on page 199)).

4748 For example:

```
order_start  forward;backward
UNDEFINED    IGNORE;IGNORE
<LOW>
<space>      <LOW>;<space>
...          <LOW>;...
<a>          <a>;<a>
<a-acute>    <a>;<a-acute>
<a-grave>    <a>;<a-grave>
<A>          <a>;<A>
<A-acute>    <a>;<A-acute>
<A-grave>    <a>;<A-grave>
<ch>         <ch>;<ch>
<Ch>         <ch>;<Ch>
<s>          <s>;<s>
<eszet>      "<s><s>";"<eszet><eszet>"
order_end
```

This example is interpreted as follows:

1. The **UNDEFINED** means that all characters not specified in this definition (explicitly or via the ellipsis) shall be ignored for collation purposes; for regular expression purposes they are ordered first.
2. All characters between <space> and `'a'` shall have the same primary equivalence class and individual secondary weights based on their ordinal encoded values.
3. All characters based on the uppercase or lowercase character `'a'` belong to the same primary equivalence class.
4. The multi-character collating element <ch> is represented by the collating symbol <ch> and belongs to the same primary equivalence class as the multi-character collating element <Ch>.

7.3.2.5 The order_end Keyword

The collating order entries shall be terminated with an **order_end** keyword.

The collation sequence definition of the POSIX locale follows; the code listing depicts the *localedef* input.

```
LC_COLLATE
# This is the POSIX locale definition for the LC_COLLATE category.
# The order is the same as in the ASCII codeset.
order_start forward

```

4915 7.3.3 LC_MONETARY

4916 The *LC_MONETARY* category shall define the rules and symbols that are used to format
4917 XSI monetary numeric information. This information is available through the *localeconv*( ) function
4918 and is used by the *strfmon*( ) function.

4919 XSI Some of the information is also available in an alternative form via the *nl_langinfo*( ) function
4920 (see CRNCYSTR in **<langinfo.h>**).

4921 The following items are defined in this category of the locale. The item names are the keywords
4922 recognized by the *localedef* utility when defining a locale. They are also similar to the member
4923 names of the **lconv** structure defined in **<locale.h>**; see **<locale.h>** for the exact symbols in the
4924 header. The *localeconv*( ) function returns {CHAR_MAX} for unspecified integer items and the
4925 empty string (" ") for unspecified or size zero string items.

4926 In a locale definition file, the operands are strings, formatted as indicated by the grammar in
4927 Section 7.4 (on page 176). For some keywords, the strings can contain only integers. Keywords
4928 that are not provided, string values set to the empty string (" "), or integer keywords set to –1,
4929 are used to indicate that the value is not available in the locale.

4930 **copy** Specify the name of an existing locale to be used as the definition of this
4931 category. If this keyword is specified, no other keyword can be specified.

4932 **Note:** This is a *localedef* utility keyword, unavailable through
4933 *localeconv*( ).

4934 **int_curr_symbol** The international currency symbol. The operand is a four-character string,
4935 with the first three characters containing the alphabetic international
4936 currency symbol in accordance with those specified in the ISO 4217: 1995
4937 standard. The fourth character is the character used to separate the
4938 international currency symbol from the monetary quantity.

4939 **currency_symbol** The string that shall be used as the local currency symbol.

4940 **mon_decimal_point** The operand is a string containing the symbol that shall be used as the
4941 decimal delimiter (radix character) in monetary formatted quantities. In
4942 contexts where standards (such as the ISO C standard) limit the
4943 **mon_decimal_point** to a single byte, the result of specifying a multi-byte
4944 operand is unspecified.

mon_thousands_sep The operand is a string containing the symbol that shall be used as a separator for groups of digits to the left of the decimal delimiter in formatted monetary quantities. In contexts where standards limit the **mon_thousands_sep** to a single byte, the result of specifying a multi-byte operand is unspecified.

mon_grouping Define the size of each group of digits in formatted monetary quantities. The operand is a sequence of integers separated by semicolons. Each integer specifies the number of digits in each group, with the initial integer defining the size of the group immediately preceding the decimal delimiter, and the following integers defining the preceding groups. If the last integer is not –1, then the size of the previous group (if any) shall be repeatedly used for the remainder of the digits. If the last integer is –1, then no further grouping shall be performed.

The following is an example of the interpretation of the **mon_grouping** keyword. Assuming that the value to be formatted is 123456789 and the **mon_thousands_sep** is `''`, then the following table shows the result. The third column shows the equivalent string in the ISO C standard that would be used by the *localeconv*() function to accommodate this grouping.

mon_grouping	Formatted Value	ISO C String
3;–1	123456’789	`"\3\177"`
3	123’456’789	`"\3"`
3;2;–1	1234’56’789	`"\3\2\177"`
3;2	12’34’56’789	`"\3\2"`
–1	123456789	`"\177"`

In these examples, the octal value of {CHAR_MAX} is 177.

positive_sign A string that shall be used to indicate a non-negative-valued formatted monetary quantity.

negative_sign A string that shall be used to indicate a negative-valued formatted monetary quantity.

int_frac_digits An integer representing the number of fractional digits (those to the right of the decimal delimiter) to be written in a formatted monetary quantity using **int_curr_symbol**.

frac_digits An integer representing the number of fractional digits (those to the right of the decimal delimiter) to be written in a formatted monetary quantity using **currency_symbol**.

p_cs_precedes An integer set to 1 if the **currency_symbol** or **int_curr_symbol** precedes the value for a monetary quantity with a non-negative value, and set to 0 if the symbol succeeds the value.

p_sep_by_space An integer set to 0 if no space separates the **currency_symbol** or **int_curr_symbol** from the value for a monetary quantity with a non-negative value, set to 1 if a space separates the symbol from the value, and set to 2 if a space separates the symbol and the sign string, if adjacent.

n_cs_precedes An integer set to 1 if the **currency_symbol** or **int_curr_symbol** precedes the value for a monetary quantity with a negative value, and set to 0 if the symbol succeeds the value.

n_sep_by_space An integer set to 0 if no space separates the **currency_symbol** or **int_curr_symbol** from the value for a monetary quantity with a negative value, set to 1 if a space separates the symbol from the value, and set to 2 if a space separates the symbol and the sign string, if adjacent.

p_sign_posn An integer set to a value indicating the positioning of the **positive_sign** for a monetary quantity with a non-negative value. The following integer values shall be recognized for both **p_sign_posn** and **n_sign_posn**:

0 Parentheses enclose the quantity and the **currency_symbol** or **int_curr_symbol**.

1 The sign string precedes the quantity and the **currency_symbol** or **int_curr_symbol**.

2 The sign string succeeds the quantity and the **currency_symbol** or **int_curr_symbol**.

3 The sign string precedes the **currency_symbol** or **int_curr_symbol**.

4 The sign string succeeds the **currency_symbol** or **int_curr_symbol**.

n_sign_posn An integer set to a value indicating the positioning of the **negative_sign** for a negative formatted monetary quantity.

The following table shows the result of various combinations:

		p_sep_by_space		
		2	**1**	**0**
p_cs_precedes = 1	**p_sign_posn** = 0	($1.25)	($ 1.25)	($1.25)
	p_sign_posn = 1	+ $1.25	+$ 1.25	+$1.25
	p_sign_posn = 2	$1.25 +	$ 1.25+	$1.25+
	p_sign_posn = 3	+ $1.25	+$ 1.25	+$1.25
	p_sign_posn = 4	$ +1.25	$+ 1.25	$+1.25
p_cs_precedes = 0	**p_sign_posn** = 0	(1.25 $)	(1.25 $)	(1.25$)
	p_sign_posn = 1	+1.25 $	+1.25 $	+1.25$
	p_sign_posn = 2	1.25$ +	1.25 $+	1.25$+
	p_sign_posn = 3	1.25+ $	1.25 +$	1.25+$
	p_sign_posn = 4	1.25$ +	1.25 $+	1.25$+

The monetary formatting definitions for the POSIX locale follow; the code listing depicting the XSI *localedef* input, the table representing the same information with the addition of *localeconv*( ) and *nl_langinfo*( )formats. All values are unspecified in the POSIX locale.

XSI In the preceding table, the **langinfo Constant** column represents an XSI-conformant extension. The entry N/A indicates that the value is not available in the POSIX locale.

7.3.4 LC_NUMERIC

The *LC_NUMERIC* category shall define the rules and symbols that are used to format non-
XSI monetary numeric information. This information is available through the *localeconv*() function. Some of the information is also available in an alternative form via the *nl_langinfo*() function.

The following items are defined in this category of the locale. The item names are the keywords recognized by the *localedef* utility when defining a locale. They are also similar to the member names of the **lconv** structure defined in **<locale.h>**; see **<locale.h>** for the exact symbols in the header. The *localeconv*() function returns {CHAR_MAX} for unspecified integer items and the empty string (" ") for unspecified or size zero string items.

In a locale definition file, the operands are strings, formatted as indicated by the grammar in Section 7.4 (on page 176). For some keywords, the strings can only contain integers. Keywords that are not provided, string values set to the empty string (" "), or integer keywords set to –1, shall be used to indicate that the value is not available in the locale. The following keywords shall be recognized:

copy Specify the name of an existing locale to be used as the definition of this category. If this keyword is specified, no other keyword can be specified.

Note: This is a *localedef* utility keyword, unavailable through *localeconv*().

decimal_point The operand is a string containing the symbol that shall be used as the decimal delimiter (radix character) in numeric, non-monetary formatted quantities. This keyword cannot be omitted and cannot be set to the empty

string. In contexts where standards limit the **decimal_point** to a single byte, the result of specifying a multi-byte operand shall be unspecified.

thousands_sep The operand is a string containing the symbol that shall be used as a separator for groups of digits to the left of the decimal delimiter in numeric, non-monetary formatted monetary quantities. In contexts where standards limit the **thousands_sep** to a single byte, the result of specifying a multi-byte operand shall be unspecified.

grouping Define the size of each group of digits in formatted non-monetary quantities. The operand is a sequence of integers separated by semicolons. Each integer specifies the number of digits in each group, with the initial integer defining the size of the group immediately preceding the decimal delimiter, and the following integers defining the preceding groups. If the last integer is not –1, then the size of the previous group (if any) shall be repeatedly used for the remainder of the digits. If the last integer is –1, then no further grouping shall be performed.

The non-monetary numeric formatting definitions for the POSIX locale follow; the code listing depicting the *localedef* input, the table representing the same information with the addition of XSI *localeconv*( ) values, and *nl_langinfo*( )constants.

```
LC_NUMERIC
# This is the POSIX locale definition for
# the LC_NUMERIC category.
#
decimal_point    "<period>"
thousands_sep    ""
grouping         -1
#
END LC_NUMERIC
```

Item	POSIX Locale Value	langinfo Constant	localeconv() Value	localedef Value
decimal_point	"."	RADIXCHAR	"."	.
thousands_sep	N/A	THOUSEP	""	""
grouping	N/A	—	""	–1

Notes to Reviewers

This section with side shading will not appear in the final copy. - Ed.

D1, XBD, ERN 112 asked why the grouping in the POSIX locale is -1, but the grouping line in the POSIX Locale Value column of this table is N/A. The response from Gary Miller (via Mark Brown) was that they are saying the same thing; the -1 means that there is no grouping, therefore the grouping is not applicable.

XSI In the preceding table, the **langinfo Constant** column represents an XSI-conforming extension. The entry N/A indicates that the value is not available in the POSIX locale.

7.3.5 LC_TIME

The *LC_TIME* category shall define the interpretation of the field descriptors supported by the XSI *date* utility and affects the behavior of the *strftime*( ), *wcsftime*( ), *strptime*( ), and *nl_langinfo*( ) functions. Because the interfaces for C-language access and locale definition differ significantly, they are described separately.

7.3.5.1 LC_TIME Locale Definition

For locale definition, the following mandatory keywords shall be recognized:

copy Specify the name of an existing locale to be used as the definition of this category. If this keyword is specified, no other keyword can be specified.

abday Define the abbreviated weekday names, corresponding to the %*a* field descriptor (conversion specification in the *strftime*( ), *wcsftime*( ), and *strptime*( ) functions). The operand consists of seven semicolon-separated strings, each surrounded by double-quotes. The first string shall be the abbreviated name of the day corresponding to Sunday, the second the abbreviated name of the day corresponding to Monday, and so on.

day Define the full weekday names, corresponding to the %*A* field descriptor. The operand consists of seven semicolon-separated strings, each surrounded by double-quotes. The first string is the full name of the day corresponding to Sunday, the second the full name of the day corresponding to Monday, and so on.

abmon Define the abbreviated month names, corresponding to the %*b* field descriptor. The operand consists of twelve semicolon-separated strings, each surrounded by double-quotes. The first string shall be the abbreviated name of the first month of the year (January), the second the abbreviated name of the second month, and so on.

mon Define the full month names, corresponding to the %*B* field descriptor. The operand consists of twelve semicolon-separated strings, each surrounded by double-quotes. The first string shall be the full name of the first month of the year (January), the second the full name of the second month, and so on.

d_t_fmt Define the appropriate date and time representation, corresponding to the %*c* field descriptor. The operand consists of a string, and can contain any combination of characters and field descriptors. In addition, the string can contain escape sequences defined in the table in Table 5-1 (on page 130) (`'\\'`, `'\a'`, `'\b'`, `'\f'`, `'\n'`, `'\r'`, `'\t'`, `'\v'`).

d_fmt Define the appropriate date representation, corresponding to the %*x* field descriptor. The operand consists of a string, and can contain any combination of characters and field descriptors. In addition, the string can contain escape sequences defined in the table in Table 5-1 (on page 130).

t_fmt Define the appropriate time representation, corresponding to the %*X* field descriptor. The operand consists of a string, and can contain any combination of characters and field descriptors. In addition, the string can contain escape sequences defined in the table in Table 5-1 (on page 130).

am_pm Define the appropriate representation of the *ante meridiem* and *post meridiem* strings, corresponding to the %*p* field descriptor. The operand consists of two strings, separated by a semicolon, each surrounded by double-quotes. The first string shall represent the *ante meridiem* designation, the last string the *post*

meridiem designation.

t_fmt_ampm Define the appropriate time representation in the 12-hour clock format with **am_pm**, corresponding to the %*r* field descriptor. The operand consists of a string and can contain any combination of characters and field descriptors. If the string is empty, the 12-hour format is not supported in the locale.

era Define how years are counted and displayed for each era in a locale. The operand consists of semicolon-separated strings. Each string is an era description segment with the format:

direction:*offset*:*start_date*:*end_date*:*era_name*:*era_format*

according to the definitions below. There can be as many era description segments as are necessary to describe the different eras.

Note: The start of an era might not be the earliest point in the era—it may be the latest. For example, the Christian era BC starts on the day before January 1, AD 1, and increases with earlier time.

direction Either a '+' or a '−' character. The '+' character indicates that years closer to the *start_date* have lower numbers than those closer to the *end_date*. The '−' character indicates that years closer to the *start_date* have higher numbers than those closer to the *end_date*.

offset The number of the year closest to the *start_date* in the era, corresponding to the %*Ey* field descriptor.

start_date A date in the form *yyyy*/*mm*/*dd*, where *yyyy*, *mm*, and *dd* are the year, month, and day numbers respectively of the start of the era. Years prior to AD 1 are represented as negative numbers.

end_date The ending date of the era, in the same format as the *start_date*, or one of the two special values "−*" or "+*". The value "−*" indicates that the ending date is the beginning of time. The value "+*" indicates that the ending date is the end of time.

era_name A string representing the name of the era, corresponding to the %*EC* field descriptor.

era_format A string for formatting the year in the era, corresponding to the %*EY* field descriptor.

era_d_fmt Define the format of the date in alternative era notation, corresponding to the %*Ex* field descriptor.

era_t_fmt Define the locale's appropriate alternative time format, corresponding to the %*EX* field descriptor.

era_d_t_fmt Define the locale's appropriate alternative date and time format, corresponding to the %*Ec* field descriptor.

alt_digits Define alternative symbols for digits, corresponding to the %*O* field descriptor modifier. The operand consists of semicolon-separated strings, each surrounded by double-quotes. The first string is the alternative symbol corresponding with zero, the second string the symbol corresponding with one, and so on. Up to 100 alternative symbol strings can be specified. The %*O* modifier indicates that the string corresponding to the value specified via the field descriptor is used instead of the value.

5215 *7.3.5.2 LC_TIME C-Language Access*

5216 XSI The following information can be accessed. These correspond to constants defined in
5217 **<langinfo.h>** and used as arguments to the *nl_langinfo*( ) function.

5218 ABDAY_*x* The abbreviated weekday names (for example Sun), where *x* is a number from
5219 1 to 7.

5220 DAY_*x* The full weekday names (for example Sunday), where *x* is a number from 1 to
5221 7.

5222 ABMON_*x* The abbreviated month names (for example Jan), where *x* is a number from 1
5223 to 12.

5224 MON_*x* The full month names (for example January), where *x* is a number from 1 to
5225 12.

5226 D_T_FMT The appropriate date and time representation.

5227 D_FMT The appropriate date representation.

5228 T_FMT The appropriate time representation.

5229 AM_STR The appropriate ante-meridiem affix.

5230 PM_STR The appropriate post-meridiem affix.

5231 T_FMT_AMPM The appropriate time representation in the 12-hour clock format with
5232 AM_STR and PM_STR.

5233 ERA The era description segments, which describe how years are counted and
5234 displayed for each era in a locale. Each era description segment has the format:

5235 *direction*:*offset*:*start_date*:*end_date*:*era_name*:*era_format*

5236 according to the definitions below. There are as many era description
5237 segments as are necessary to describe the different eras. Era description
5238 segments are separated by semicolons.

5239 *direction* Either a '+' or a '−' character. The '+' character indicates that
5240 years closer to the *start_date* have lower numbers than those
5241 closer to the *end_date*. The '−' character indicates that years
5242 closer to the *start_date* have higher numbers than those closer to
5243 the *end_date*.

5244 *offset* The number of the year closest to the *start_date* in the era.

5245 *start_date* A date in the form *yyyy*/*mm*/*dd*, where *yyyy*, *mm*, and *dd* are the
5246 year, month, and day numbers respectively of the start of the
5247 era. Years prior to AD 1 are represented as negative numbers.

5248 *end_date* The ending date of the era, in the same format as the *start_date*,
5249 or one of the two special values "−*" or "+*". The value "−*"
5250 indicates that the ending date is the beginning of time. The value
5251 "+*" indicates that the ending date is the end of time.

5252 *era_name* The era, corresponding to the %*EC* conversion specification.

5253 *era_format* The format of the year in the era, corresponding to the %*EY*
5254 conversion specification.

5255 ERA_D_FMT The era date format.

ERA_T_FMT The locale's appropriate alternative time format, corresponding to the %*EX* field descriptor.

ERA_D_T_FMT The locale's appropriate alternative date and time format, corresponding to the %*Ec* field descriptor.

ALT_DIGITS The alternative symbols for digits, corresponding to the %*O* conversion specification modifier. The value consists of semicolon-separated symbols. The first is the alternative symbol corresponding to zero, the second is the symbol corresponding to one, and so on. Up to 100 alternative symbols may be specified.

The following table displays the correspondence between the items described above and the conversion specifiers used by the *date* utility and the *strftime*( ), *wcsftime*( ), and *strptime*( ) functions.

localedef Keyword	**langinfo Constant**	**Conversion Specifier**
abday	ABDAY_*x*	%*a*
day	DAY_*x*	%*A*
abmon	ABMON_*x*	%*b*
mon	MON	%*B*
d_t_fmt	D_T_FMT	%*c*
d_fmt	D_FMT	%*x*
t_fmt	T_FMT	%*X*
am_pm	AM_STR	%*p*
am_pm	PM_STR	%*p*
t_fmt_ampm	T_FMT_AMPM	%*r*
era	ERA	%*EC*, %*Ey*, %*EY*
era_d_fmt	ERA_D_FMT	%*Ex*
era_t_fmt	ERA_T_FMT	%*EX*
era_d_t_fmt	ERA_D_T_FMT	%*Ec*
alt_digits	ALT_DIGITS	%*O*

In the preceding table, the **langinfo Constant** column represents an XSI-conformant extension. |

7.3.5.3 LC_TIME General Information

The following is an example for Japan that supports the current plus last three Emperors and reverts to Western style numbering for years prior to the Meiji era. The example also allows for the custom of using a special name for the first year of an era instead of using 1. (The examples substitute romaji where kanji should be used.)

```
era_d_fmt "%EY%mgatsu%dnichi (%a)"

era     "+:2:1990/01/01:+*:Heisei:%EC%Eynen";\
        "+:1:1989/01/08:1989/12/31:Heisei:%ECgannen";\
        "+:2:1927/01/01:1989/01/07:Shouwa:%EC%Eynen";\
        "+:1:1926/12/25:1926/12/31:Shouwa:%ECgannen";\
        "+:2:1913/01/01:1926/12/24:Taishou:%EC%Eynen";\
        "+:1:1912/07/30:1912/12/31:Taishou:%ECgannen";\
        "+:2:1869/01/01:1912/07/29:Meiji:%EC%Eynen";\
        "+:1:1868/09/08:1868/12/31:Meiji:%ECgannen";\
        "-:1868:1868/09/07:-*::%Ey"
```

Assuming that the current date is September 21, 1991, a request to *date* or *strftime*() would yield the following results:

```
%Ec - Heisei3nen9gatsu21nichi (Sat) 14:39:26
%EC - Heisei
%Ex - Heisei3nen9gatsu21nichi (Sat)
%Ey - 3
%EY - Heisei3nen
```

Example era definitions for the Republic of China:

```
era     "+:2:1913/01/01:+*:ChungHwaMingGuo:%EC%EyNen";\
        "+:1:1912/1/1:1912/12/31:ChungHwaMingGuo:%ECYuenNen";\
        "+:1:1911/12/31:-*:MingChien:%EC%EyNen"
```

Example definitions for the Christian Era:

```
era     "+:0:0000/01/01:+*:AD:%EC %Ey";\
        "+:1:-0001/12/31:-*:BC:%Ey %EC"
```

The *LC_TIME* category definition of the POSIX locale follows; the code listing depicts the *localedef* input; the table depicts the *langinfo* items defined in this category.

XSI

```
LC_TIME
# This is the POSIX locale definition for
# the LC_TIME category.

7.3.6 LC_MESSAGES

The *LC_MESSAGES* category shall define the format and values for affirmative and negative responses.

XSI The message catalog used by the standard utilities and selected by the *catopen*( ) function shall be determined by the setting of *NLSPATH*; see Chapter 8 (on page 187). The *LC_MESSAGES* category can be specified as part of an *NLSPATH* substitution field.

XSI The following keywords shall be recognized as part of the locale definition file. The *nl_langinfo*( ) function accepts uppercase versions of the first four keywords.

copy Specify the name of an existing locale to be used as the definition of this category. If this keyword is specified, no other keyword can be specified.

yesexpr The operand consists of an extended regular expression (see Section 9.4 (on page 203)) that describes the acceptable affirmative response to a question expecting an affirmative or negative response.

noexpr The operand consists of an extended regular expression that describes the acceptable negative response to a question expecting an affirmative or negative response.

The format and values for affirmative and negative responses of the POSIX locale follow; the code listing depicting the *localedef* input, the table representing the same information with the addition of XSI *nl_langinfo*( ) constants.

```
LC_MESSAGES
# This is the POSIX locale definition for
# the LC_MESSAGES category.
#
```

```
        yesexpr "<circumflex><left-square-bracket><y><Y><right-square-bracket>"
        #
        noexpr  "<circumflex><left-square-bracket><n><N><right-square-bracket>"
        #
XSI     yesstr  "yes"
        nostr   "no"
        END LC_MESSAGES
```

localedef Keyword	langinfo Constant	POSIX Locale Value
yesexpr	YESEXPR	"^[yY]"
noexpr	NOEXPR	"^[nN]"
XSI **yesstr**	YESSTR	"yes" (**LEGACY**)
XSI **nostr**	NOSTR	"no" (**LEGACY**)

7.3.6.1 LC_MESSAGES Application Usage

XSI The **yesstr** and **nostr** locale keywords and the YESSTR and NOSTR *langinfo* items were formerly used to match user affirmative and negative responses. In IEEE Std. 1003.1-200x, the **yesexpr**, **noexpr**, YESEXPR, and NOEXPR extended regular expressions have replaced them. However, they have been retained for backward compatibility to allow an application to include a sample desired response in a prompting message. They are marked LEGACY. Applications should use the general locale-based messaging facilities to issue such prompting messages.

7.4 Locale Definition Grammar

The grammar and lexical conventions in this section shall together describe the syntax for the locale definition source. The general conventions for this style of grammar are described in the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 1.10, Grammar Conventions. The grammar shall take precedence over the text in this chapter.

7.4.1 Locale Lexical Conventions

The lexical conventions for the locale definition grammar are described in this section.

The following tokens shall be processed (in addition to those string constants shown in the grammar):

LOC_NAME	A string of characters representing the name of a locale.
CHAR	Any single character.
NUMBER	A decimal number, represented by one or more decimal digits.
COLLSYMBOL	A symbolic name, enclosed between angle brackets. The string cannot duplicate any charmap symbol defined in the current charmap (if any), or a **COLLELEMENT** symbol.
COLLELEMENT	A symbolic name, enclosed between angle brackets, which cannot duplicate either any charmap symbol or a **COLLSYMBOL** symbol.
CHARCLASS	A string of alphanumeric characters from the portable character set, the first of which is not a digit, consisting of at least one and at most {CHARCLASS_NAME_MAX} bytes, and optionally surrounded by double-quotes.
CHARSYMBOL	A symbolic name, enclosed between angle brackets, from the current charmap (if any).
OCTAL_CHAR	One or more octal representations of the encoding of each byte in a single character. The octal representation consists of an escape character (normally a backslash) followed by two or more octal digits.
HEX_CHAR	One or more hexadecimal representations of the encoding of each byte in a single character. The hexadecimal representation consists of an escape character followed by the constant *x* and two or more hexadecimal digits.
DECIMAL_CHAR	One or more decimal representations of the encoding of each byte in a single character. The decimal representation consists of an escape character followed by a character `'d'` and two or more decimal digits.
ELLIPSIS	The string `"..."`.
EXTENDED_REG_EXP	An extended regular expression as defined in the grammar in Section 9.5 (on page 206).
EOL	The line termination character newline.

7.4.2 Locale Grammar

This section presents the grammar for the locale definition.

```
%token              LOC_NAME

7.5 Locale Definition Example

The following is an example of a locale definition file that could be used as input to the *localedef* utility. It assumes that the utility is executed with the **–f** option, naming a *charmap* file with (at least) the following content:

```
CHARMAP
<space>      \x20
<dollar>     \x24
<A>          \101
<a>          \141
<A-acute>    \346
<a-acute>    \365
<A-grave>    \300
<a-grave>    \366
<b>          \142
<C>          \103
<c>          \143
<c-cedilla>  \347
<d>          \x64
<H>          \110
<h>          \150
<eszet>      \xb7
<s>          \x73
<z>          \x7a
END CHARMAP
```

It should not be taken as complete or to represent any actual locale, but only to illustrate the syntax.

```
#
LC_CTYPE
lower   <a>;<b>;<c>;<c-cedilla>;<d>;...;<z>
upper   A;B;C;Ç;...;Z
space   \x20;\x09;\x0a;\x0b;\x0c;\x0d
blank   \040;\011
toupper (<a>,<A>);(b,B);(c,C);(ç,Ç);(d,D);(z,Z)
END LC_CTYPE
#
LC_COLLATE
#
# The following example of collation is based on
# Canadian standard Z243.4.1-1998, "Canadian Alphanumeric
# Ordering Standard For Character sets of CSA Z234.4 Standard".
# (Other parts of this example locale definition file do not
# purport to relate to Canada, or to any other real culture.)
# The proposed standard defines a 4-weight collation, such that
# in the first pass, characters are compared without regard to
# case or accents; in second pass, backwards compare without
# regard to case; in the third pass, forward compare without
# regard to diacriticals. In the 3 first passes, non-alphabetic
# characters are ignored; in the fourth pass, only special
# characters are considered, such that "The string that has a
# special character in the lowest position comes first. If two
```

```
5767        # strings have a special character in the same position, the
5768        # collation value of the special character determines ordering.
5769        #
5770        # Only a subset of the character set is used here; mostly to
5771        # illustrate the set-up.
5772        #
5773        collating-symbol <NULL>
5774        collating-symbol <LOW_VALUE>
5775        collating-symbol <LOWER-CASE>
5776        collating-symbol <SUBSCRIPT-LOWER>
5777        collating-symbol <SUPERSCRIPT-LOWER>
5778        collating-symbol <UPPER-CASE>
5779        collating-symbol <NO-ACCENT>
5780        collating-symbol <PECULIAR>

Chapter 8

Environment Variables

8.1 Environment Variable Definition

Environment variables defined in this chapter affect the operation of multiple utilities, functions, and applications. There are other environment variables that are of interest only to specific utilities. Environment variables that apply to a single utility only are defined as part of the utility description. See the ENVIRONMENT VARIABLES section of the utility descriptions in the Shell and Utilities volume of IEEE Std. 1003.1-200x for information on environment variable usage.

The value of an environment variable is a string of characters. For a C-language program, an array of strings called the environment is made available when a process begins. The array is pointed to by the external variable *environ*, which is defined as:

```
extern char **environ;
```

These strings have the form *name=value*; *name*s do not contain the character '='. For values to be portable across systems conforming to IEEE Std. 1003.1-200x, the value shall be composed of characters from the portable character set (except NUL and as indicated below). There is no meaning associated with the order of strings in the environment. If more than one string in a process' environment has the same *name*, the consequences are undefined.

Environment variable names used by the utilities in the Shell and Utilities volume of IEEE Std. 1003.1-200x shall consist solely of uppercase letters, digits, and the '_' (underscore) from the characters defined in Table 6-1 (on page 133). Other characters may be permitted by an implementation; applications shall tolerate the presence of such names. Uppercase and lowercase letters retain their unique identities and are not folded together. The name space of environment variable names containing lowercase letters is reserved for applications. Applications can define any environment variables with names from this name space without modifying the behavior of the standard utilities.

The *values* that the environment variables may be assigned are not restricted except that they are considered to end with a null byte and the total space used to store the environment and the arguments to the process is limited to {ARG_MAX} bytes.

Other *name=value* pairs may be placed in the environment by, for example, calling any of the XSI *setenv*( ), *unsetenv*( ), or *putenv*( ) functions, manipulating the *environ* variable, or by using *envp* arguments when creating a process; see *exec* in the System Interfaces volume of IEEE Std. 1003.1-200x.

It is unwise to conflict with certain variables that are frequently exported by widely used command interpreters and applications:

ARFLAGS	*IFS*	*MAILPATH*	*PS1*

If the variables in the following two sections are present in the environment during the execution of an application or utility, they are given the meaning described below. Some are placed into the environment by the implementation at the time the user logs in; all can be added or changed by the user or any ancestor of the current process. The implementation adds or changes environment variables named in IEEE Std. 1003.1-200x only as specified in IEEE Std. 1003.1-200x. If they are defined in the application's environment, the utilities in the Shell and Utilities volume of IEEE Std. 1003.1-200x and the functions in the System Interfaces volume of IEEE Std. 1003.1-200x assume they have the specified meaning. Conforming applications shall not set these environment variables to have meanings other than as described. See *getenv*( ) and the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.13, Shell Execution Environment for methods of accessing these variables.

8.2 Internationalization Variables

This section describes environment variables that are relevant to the operation of internationalized interfaces described in the System Interfaces volume of IEEE Std. 1003.1-200x and the Shell and Utilities volume of IEEE Std. 1003.1-200x.

Users may use the following environment variables to announce specific localization requirements to applications. Applications shall retrieve this information using the *setlocale*( ) function to initialize the correct behavior of the internationalized interfaces. The descriptions of the internationalization environment variables describe the resulting behavior only when the application locale is initialized in this way.

LANG This variable shall determine the locale category for native language, local customs, and coded character set in the absence of the *LC_ALL* and other *LC_** (*LC_COLLATE*, *LC_CTYPE*, *LC_MESSAGES*, *LC_MONETARY*, *LC_NUMERIC*, *LC_TIME*) environment variables. This can be used by applications to determine the language to use for error messages and instructions, collating sequences, date formats, and so on.

LC_ALL This variable shall determine the values for all locale categories. The value of the *LC_ALL* environment variable has precedence over any of the other environment variables starting with *LC_*(*LC_COLLATE*, *LC_CTYPE*, *LC_MESSAGES*, *LC_MONETARY*, *LC_NUMERIC*, *LC_TIME*) and the *LANG* environment variable.

LC_COLLATE This variable shall determine the locale category for character collation. It determines collation information for regular expressions and sorting, including equivalence classes and multi-character collating elements, in various utilities and the *strcoll*( ) and *strxfrm*( ) functions. Additional semantics of this variable, if any, are implementation-defined.

LC_CTYPE This variable shall determine the locale category for character handling functions, such as *tolower*( ), *toupper*( ), and *isalpha*( ). This environment variable determines the interpretation of sequences of bytes of text data as characters (for example, single as opposed to multi-byte characters), the classification of characters (for example, alpha, digit, graph), and the behavior of character classes. Additional semantics of this variable, if any, are implementation-defined.

LC_MESSAGES This variable shall determine the locale category for processing affirmative and negative responses and the language and cultural conventions in which XSI messages should be written. It also affects the behavior of the *catopen*( ) function in determining the message catalog. Additional semantics of this variable, if any, are implementation-defined. The language and cultural conventions of diagnostic and informative messages whose format is unspecified by IEEE Std. 1003.1-200x should be affected by the setting of *LC_MESSAGES*.

LC_MONETARY This variable shall determine the locale category for monetary-related numeric formatting information. Additional semantics of this variable, if any, are implementation-defined.

LC_NUMERIC This variable shall determine the locale category for numeric formatting (for example, thousands separator and radix character) information in various utilities as well as the formatted I/O operations in *printf*( ) and *scanf*( ) and the string conversion functions in *strtod*( ). Additional semantics of this variable, if any, are implementation-defined.

LC_TIME This variable shall determine the locale category for date and time formatting information. It affects the behavior of the time functions in *strftime*(). Additional semantics of this variable, if any, are implementation-defined.

XSI *NLSPATH* This variable shall contain a sequence of templates that the *catopen*() function uses when attempting to locate message catalogs. Each template consists of an optional prefix, one or more substitution fields, a file name, and an optional suffix.

For example:

```
NLSPATH="/system/nlslib/%N.cat"
```

defines that *catopen*() should look for all message catalogs in the directory **/system/nlslib**, where the catalog name should be constructed from the *name* parameter passed to *catopen*() (%*N*), with the suffix **.cat**.

Substitution fields consist of a '%' symbol, followed by a single-letter keyword. The following keywords are currently defined:

%*N* The value of the *name* parameter passed to *catopen*().

%*L* The value of the *LC_MESSAGES* category.

%*l* The *language* element from the *LC_MESSAGES* category.

%*t* The *territory* element from the *LC_MESSAGES* category.

%*c* The *codeset* element from the *LC_MESSAGES* category.

%% A single '%' character.

An empty string is substituted if the specified value is not currently defined. The separators underscore ('_') and period ('.') are not included in %*t* and %*c* substitutions.

Templates defined in *NLSPATH* are separated by colons (':'). A leading or two adjacent colons "::" is equivalent to specifying %*N*. For example:

```
NLSPATH=":%N.cat:/nlslib/%L/%N.cat"
```

indicates to *catopen*() that it should look for the requested message catalog in *name*, *name***.cat**, and **/nlslib/***category***/***name***.cat**, where *category* is the value of the *LC_MESSAGES* category of the current locale.

Users should not set the *NLSPATH* variable unless they have a specific reason to override the default system path. Doing so causes undefined behavior in the standard utilities.

The environment variables *LANG*, *LC_ALL*, *LC_COLLATE*, *LC_CTYPE*, *LC_MESSAGES*, XSI *LC_MONETARY*, *LC_NUMERIC*, *LC_TIME*, and *NLSPATH* provide for the support of internationalized applications. The standard utilities shall make use of these environment variables as described in this section and the individual ENVIRONMENT VARIABLES sections for the utilities. If these variables specify locale categories that are not based upon the same underlying codeset, the results are unspecified.

The values of locale categories shall be determined by a precedence order; the first condition met below determines the value:

1. If the *LC_ALL* environment variable is defined and is not null, the value of *LC_ALL* shall be used.

2. If the *LC_** environment variable (*LC_COLLATE*, *LC_CTYPE*, *LC_MESSAGES*, *LC_MONETARY*, *LC_NUMERIC*, *LC_TIME*) is defined and is not null, the value of the environment variable shall be used to initialize the category that corresponds to the environment variable.
3. If the *LANG* environment variable is defined and is not null, the value of the *LANG* environment variable shall be used.
4. If the *LANG* environment variable is not set or is set to the empty string, the implementation-defined default locale shall be used.

If the locale value is `"C"` or `"POSIX"`, the POSIX locale shall be used and the standard utilities behave in accordance with the rules in Section 7.2 (on page 144) for the associated category.

If the locale value begins with a slash, it shall be interpreted as the path name of a file that was created in the output format used by the *localedef* utility; see OUTPUT FILES under *localedef*. Referencing such a path name results in that locale being used for the indicated category.

XSI If the locale value has the form:

```
language[_territory][.codeset]
```

it refers to an implementation-provided locale, where settings of language, territory, and codeset are implementation-defined.

LC_COLLATE, *LC_CTYPE*, *LC_MESSAGES*, *LC_MONETARY*, *LC_NUMERIC*, and *LC_TIME* are defined to accept an additional field *@modifier*, which allows the user to select a specific instance of localization data within a single category (for example, for selecting the dictionary as opposed to the character ordering of data). The syntax for these environment variables is thus defined as:

```
[language[_territory][.codeset][@modifier]]
```

For example, if a user wanted to interact with the system in French, but required to sort German text files, *LANG* and *LC_COLLATE* could be defined as:

```
LANG=Fr_FR
LC_COLLATE=De_DE
```

This could be extended to select dictionary collation (say) by use of the *@modifier* field; for example:

```
LC_COLLATE=De_DE@dict
```

An implementation may support other formats.

If the locale value is not recognized by the implementation, the behavior is unspecified.

At runtime, these values are bound to a program's locale by calling the *setlocale*( ) function.

Additional criteria for determining a valid locale name are implementation-defined.

8.3 Other Environment Variables

COLUMNS This variable shall represent a decimal integer >0 used to indicate the user's preferred width in column positions for the terminal screen or window; see Section 3.106 (on page 59). If this variable is unset or null, the implementation determines the number of columns, appropriate for the terminal or window, in an unspecified manner. When *COLUMNS* is set, any terminal-width information implied by *TERM* is overridden. Users and portable applications should not set *COLUMNS* unless they wish to override the system selection and produce output unrelated to the terminal characteristics.

Users should not need to set this variable in the environment unless there is a specific reason to override the implementation's default behavior, such as to display data in an area arbitrarily smaller than the terminal or window.

XSI *DATEMSK* Indicates the path name of the template file used by *getdate*( ).

HOME The system initializes this variable at the time of login to be a path name of the user's home directory. See **<pwd.h>**.

LINES This variable shall represent a decimal integer >0 used to indicate the user's preferred number of lines on a page or the vertical screen or window size in lines. A line in this case is a vertical measure large enough to hold the tallest character in the character set being displayed. If this variable is unset or null, the implementation determines the number of lines, appropriate for the terminal or window (size, terminal baud rate, and so on), in an unspecified manner. When *LINES* is set, any terminal-height information implied by *TERM* is overridden. Users and portable applications should not set *LINES* unless they wish to override the system selection and produce output unrelated to the terminal characteristics.

Users should not need to set this variable in the environment unless there is a specific reason to override the implementation's default behavior, such as to display data in an area arbitrarily smaller than the terminal or window.

LOGNAME The system initializes this variable at the time of login to be the user's login name. See **<pwd.h>**. For a value of *LOGNAME* to be portable across implementations of IEEE Std. 1003.1-200x, the value should be composed of characters from the portable file name character set.

XSI *MSGVERB* Describes which message components shall be used in writing messages by *fmtmsg*( ).

PATH This variable shall represent the sequence of path prefixes that certain functions and utilities apply in searching for an executable file known only by a file name. The prefixes are separated by a colon (`':'`). When a non-zero-length prefix is applied to this file name, a slash is inserted between the prefix and the file name. A zero-length prefix is a legacy feature that indicates the current working directory. It appears as two adjacent colons (`"::"`), as an initial colon preceding the rest of the list, or as a trailing colon following the rest of the list. A portable application shall use an actual path name (such as **.**) to represent the current working directory in *PATH*. The list is searched from beginning to end, applying the file name to each prefix, until an executable file with the specified name and appropriate execution permissions is found. If the path name being sought contains a slash, the search through the path prefixes is not performed. If the path name begins with a slash, the specified path is resolved (see Section 4.9 (on page 123)). If *PATH* is unset or is set to

null, the path search is implementation-defined.

PWD This variable shall represent an absolute path name of the current working directory. It shall not contain any file name components of dot or dot-dot. The value is set by the *cd* utility.

SHELL This variable shall represent a path name of the user's preferred command language interpreter. If this interpreter does not conform to the Shell Command Language in the Shell and Utilities volume of IEEE Std. 1003.1-200x, Chapter 2, Shell Command Language, utilities may behave differently from those described in IEEE Std. 1003.1-200x.

TMPDIR This variable shall represent a path name of a directory made available for programs that need a place to create temporary files.

TERM This variable shall represent the terminal type for which output is to be prepared. This information is used by utilities and application programs wishing to exploit special capabilities specific to a terminal. The format and allowable values of this environment variable are unspecified.

TZ This variable shall represent timezone information. The contents of the environment variable named *TZ* shall be used by the *ctime*( ), *localtime*( ), *strftime*( ), and *mktime*( ) functions, and by various utilities, to override the default timezone. The value of *TZ* has one of the two forms (spaces inserted for clarity):

```
:characters
```

or:

```
std offset dst offset, rule
```

If *TZ* is of the first format (that is, if the first character is a colon), the characters following the colon are handled in an implementation-defined manner.

The expanded format (for all *TZ*s whose value does not have a colon as the first character) is as follows:

```
stdoffset[dst[offset][,start[/time],end[/time]]]
```

Where:

std and *dst* Indicate no less than three, nor more than {TZNAME_MAX}, bytes that are the designation for the standard (*std*) or the alternative (*dst*—such as Daylight Savings Time) timezone. Only *std* is required; if *dst* is missing, then the alternative time does not apply in this locale.

Each of these fields may occur in either of two formats quoted or unquoted:

— In the quoted form, the first character shall be the less-than (`'<'`) character and the last character shall be the greater-than (`'>'`) character. All characters between these quoting characters shall be alphanumeric characters in the current locale, the plus-sign (`'+'`) character, or the minus-sign (`'–'`) character. The *std* and *dst* fields in this case do not include the quoting characters.

— In the unquoted form, all characters in these fields shall be alphabetic characters in the current locale.

The interpretation of these fields is unspecified if either field is less than three bytes (except for the case when *dst* is missing), more than {TZNAME_MAX} bytes, or if they contain characters other than those specified.

offset Indicates the value added to the local time to arrive at Coordinated Universal Time. The *offset* has the form:

hh`[:`*mm*`[:`*ss*`]]`

The minutes (*mm*) and seconds (*ss*) are optional. The hour (*hh*) shall be required and may be a single digit. The *offset* following *std* shall be required. If no *offset* follows *dst*, the alternative time is assumed to be one hour ahead of standard time. One or more digits may be used; the value is always interpreted as a decimal number. The hour shall be between zero and 24, and the minutes (and seconds)—if present—between zero and 59. The result of using values outside of this range is unspecified. If preceded by a `'-'`, the timezone shall be east of the Prime Meridian; otherwise, it shall be west (which may be indicated by an optional preceding `'+'`).

rule Indicates when to change to and back from the alternative time. The *rule* has the form:

date`[/`*time*`],`*date*`[/`*time*`]`

where the first *date* describes when the change from standard to alternative time occurs and the second *date* describes when the change back happens. Each *time* field describes when, in current local time, the change to the other time is made.

The format of *date* is one of the following:

J*n* The Julian day *n* ($1 \le n \le 365$). Leap days shall not be counted. That is, in all years—including leap years—February 28 is day 59 and March 1 is day 60. It is impossible to refer explicitly to the occasional February 29.

n The zero-based Julian day ($0 \le n \le 365$). Leap days shall be counted, and it is possible to refer to February 29.

M*m.n.d* The *d*'th day ($0 \le d \le 6$) of week *n* of month *m* of the year ($1 \le n \le 5$, $1 \le m \le 12$, where week 5 means ''the last *d* day in month *m*'' which may occur in either the fourth or the fifth week). Week 1 is the first week in which the *d*'th day occurs. Day zero is Sunday.

The *time* has the same format as *offset* except that no leading sign (`'-'` or `'+'`) is allowed. The default, if *time* is not given, shall be 02:00:00.

Chapter 9

Regular Expressions

Regular Expressions (REs) provide a mechanism to select specific strings from a set of character strings.

Regular expressions are a context-independent syntax that can represent a wide variety of character sets and character set orderings, where these character sets are interpreted according to the current locale. While many regular expressions can be interpreted differently depending on the current locale, many features, such as character class expressions, provide for contextual invariance across locales.

The Basic Regular Expression (BRE) notation and construction rules in Section 9.3 (on page 198) shall apply to most utilities supporting regular expressions. Some utilities, instead, support the Extended Regular Expressions (ERE) described in Section 9.4 (on page 203); any exceptions for both cases are noted in the descriptions of the specific utilities using regular expressions. Both BREs and EREs are supported by the Regular Expression Matching interface in the System Interfaces volume of IEEE Std. 1003.1-200x under *regcomp*( ), *regexec*( ), and related functions.

9.1 Regular Expression Definitions

For the purposes of this section, the following definitions shall apply:

entire regular expression
The concatenated set of one or more BREs or EREs that make up the pattern specified for string selection.

matched
A sequence of zero or more characters shall be said to be matched by a BRE or ERE when the characters in the sequence correspond to a sequence of characters defined by the pattern.

Matching shall be based on the bit pattern used for encoding the character, not on the graphic representation of the character. This means that if a character set contains two or more encodings for a graphic symbol, or if the strings searched contain text encoded in more than one codeset, no attempt is made to search for any other representation of the encoded symbol. If that is required, the user can specify equivalence classes containing all variations of the desired graphic symbol.

The search for a matching sequence starts at the beginning of a string and stops when the first sequence matching the expression is found, where *first* is defined to mean ‘‘begins earliest in the string’’. If the pattern permits a variable number of matching characters and thus there is more than one such sequence starting at that point, the longest such sequence is matched. For example: the BRE `"bb*"` matches the second to fourth characters of *abbbc*, and the ERE (*wee*|*week*)(*knights*|*night*) matches all ten characters of *weeknights*.

Consistent with the whole match being the longest of the leftmost matches, each subpattern, from left to right, shall match the longest possible string. For this purpose, a null string shall be considered to be longer than no match at all. For example, matching the BRE `"\(.*\).*"` against `"abcdef"`, the subexpression `"(\1)"` is `"abcdef"`, and matching the BRE `"\(a*\)*"` against `"bc"`, the subexpression `"(\1)"` is the null string.

When a multi-character collating element in a bracket expression (see Section 9.3.5 (on page 199)) is involved, the longest sequence shall be measured in characters consumed from the string to be matched; that is, the collating element counts not as one element, but as the number of characters it matches.

BRE (ERE) matching a single character
A BRE or ERE that shall match either a single character or a single collating element.

Only a BRE or ERE of this type that includes a bracket expression (see Section 9.3.5 (on page 199)) can match a collating element.

BRE (ERE) matching multiple characters
A BRE or ERE that shall match a concatenation of single characters or collating elements.

Such a BRE or ERE is made up from a BRE (ERE) matching a single character and BRE (ERE) special characters.

invalid
This section uses the term *invalid* for certain constructs or conditions. Invalid REs shall cause the utility or function using the RE to generate an error condition. When *invalid* is not used, violations of the specified syntax or semantics for REs produce undefined results: this may entail an error, enabling an extended syntax for that RE, or using the construct in error as literal characters to be matched. For example, the BRE construct `"\{1,2,3\}"` does not comply with the grammar. A portable application cannot rely on it producing an error nor matching the literal characters `"\{1,2,3\}"`.

9.2 Regular Expression General Requirements

The requirements in this section shall apply to both basic and extended regular expressions.

The use of regular expressions is generally associated with text processing. REs (BREs and EREs) operate on text strings; that is, zero or more characters followed by an end-of-string delimiter (typically NUL). Some utilities employing regular expressions limit the processing to lines; that is, zero or more characters followed by a <newline> character. In the regular expression processing described in IEEE Std. 1003.1-200x, the <newline> character is regarded as an ordinary character and both a period and a non-matching list can match one. The Shell and Utilities volume of IEEE Std. 1003.1-200x specifies within the individual descriptions of those standard utilities employing regular expressions whether they permit matching of <newline> characters; if not stated otherwise, the use of literal <newline> characters or any escape sequence equivalent produces undefined results. Those utilities (like *grep*) that do not allow <newline> characters to match are responsible for eliminating any <newline> character from strings before matching against the RE. The *regcomp*( ) function in the System Interfaces volume of IEEE Std. 1003.1-200x, however, can provide support for such processing without violating the rules of this section.

The interfaces specified in IEEE Std. 1003.1-200x do not permit the inclusion of a NUL character in an RE or in the string to be matched. If during the operation of a standard utility a NUL is included in the text designated to be matched, that NUL may designate the end of the text string for the purposes of matching.

When a standard utility or function that uses regular expressions specifies that pattern matching shall be performed without regard to the case (uppercase or lowercase) of either data or patterns, then when each character in the string is matched against the pattern, not only the character, but also its case counterpart (if any), shall be matched. This definition of case-insensitive processing is intended to allow matching of multi-character collating elements as well as characters. For example, as each character in the string is matched using both its cases, the RE `"[[.Ch.]]"` when matched against the string `"char"`, is in reality matched against `"ch"`, `"Ch"`, `"cH"`, and `"CH"`.

The implementation shall support any regular expression that does not exceed 256 bytes in length.

9.3 Basic Regular Expressions

9.3.1 BREs Matching a Single Character or Collating Element

A BRE ordinary character, a special character preceded by a backslash or a period, shall match a single character. A bracket expression shall match a single character or a single collating element.

9.3.2 BRE Ordinary Characters

An ordinary character is a BRE that matches itself: any character in the supported character set, except for the BRE special characters listed in Section 9.3.3.

The interpretation of an ordinary character preceded by a backslash (`'\'`) is undefined, except for:

- The characters `')'`, `'('`, `'{'`, and `'}'`
- The digits 1 to 9 inclusive (see Section 9.3.6 (on page 201))
- A character inside a bracket expression

9.3.3 BRE Special Characters

A *BRE special character* has special properties in certain contexts. Outside those contexts, or when preceded by a backslash, such a character is a BRE that matches the special character itself. The BRE special characters and the contexts in which they have their special meaning are as follows:

`. [ \` The period, left-bracket, and backslash shall be special except when used in a bracket expression (see Section 9.3.5 (on page 199)). An expression containing a `'['` that is not preceded by a backslash and is not part of a bracket expression produces undefined results.

`*` The asterisk shall be special except when used:

- In a bracket expression
- As the first character of an entire BRE (after an initial `'^'`, if any)
- As the first character of a subexpression (after an initial `'^'`, if any); see Section 9.3.6 (on page 201)

`^` The circumflex shall be special when used as:

- An anchor (see Section 9.3.8 (on page 202))
- The first character of a bracket expression (see Section 9.3.5 (on page 199))

`$` The dollar sign shall be special when used as an anchor.

9.3.4 Periods in BREs

A period (`'.'`), when used outside a bracket expression, is a BRE that shall match any character in the supported character set except NUL.

9.3.5 RE Bracket Expression

A bracket expression (an expression enclosed in square brackets, "[]") is an RE that matches a single collating element contained in the non-empty set of collating elements represented by the bracket expression.

The following rules and definitions apply to bracket expressions:

1. A *bracket expression* is either a matching list expression or a non-matching list expression. It consists of one or more expressions: collating elements, collating symbols, equivalence classes, character classes, or range expressions. Portable applications shall not use range expressions, even though all implementations shall support them. The right-bracket (']') shall lose its special meaning and represents itself in a bracket expression if it occurs first in the list (after an initial circumflex ('^'), if any). Otherwise, it shall terminate the bracket expression, unless it appears in a collating symbol (such as "[.].]") or is the ending right-bracket for a collating symbol, equivalence class, or character class. The special characters '.', '*', '[', and '\' (period, asterisk, left-bracket, and backslash, respectively) shall lose their special meaning within a bracket expression.

   The character sequences "[.", "[=", and "[:" (left-bracket followed by a period, equals-sign, or colon) shall be special inside a bracket expression and are used to delimit collating symbols, equivalence class expressions, and character class expressions. These symbols shall be followed by a valid expression and the matching terminating sequence ".]", "=]", or ":]", as described in the following items.

2. A *matching list* expression specifies a list that shall match any one of the expressions represented in the list. The first character in the list shall not be the circumflex; for example, "[abc]" is an RE that matches any of the characters 'a', 'b', or 'c'.

3. A *non-matching list* expression begins with a circumflex ('^'), and specifies a list that shall match any character or collating element except for the expressions represented in the list after the leading circumflex. For example, "[^abc]" is an RE that matches any character or collating element except the characters 'a', 'b', or 'c'. The circumflex shall have this special meaning only when it occurs first in the list, immediately following the left-bracket.

4. A *collating symbol* is a collating element enclosed within bracket-period ("[." and ".]") delimiters. Collating elements are defined as described in Section 7.3.2.4 (on page 158). Portable applications shall represent multi-character collating elements as collating symbols when it is necessary to distinguish them from a list of the individual characters that make up the multi-character collating element. For example, if the string "ch" is a collating element in the current collation sequence with the associated collating symbol <*ch*>, the expression "[[.ch.]]" shall be treated as an RE matching the character sequence 'ch', while "[ch]" shall be treated as an RE matching 'c' or 'h'. Collating symbols are recognized only inside bracket expressions. This implies that the RE "[[.ch.]]*c" shall match the first to fifth character in the string "chchch". If the string is not a collating element in the current collating sequence definition, or if the collating element has no characters associated with it (for example, see the symbol <HIGH> in the example collation definition shown in Section 7.3.2.2 (on page 157)), the symbol shall be treated as an invalid expression.

5. An *equivalence class expression* shall represent the set of collating elements belonging to an equivalence class, as described in Section 7.3.2.4 (on page 158). Only primary equivalence classes shall be recognized. The class shall be expressed by enclosing any one of the collating elements in the equivalence class within bracket-equal ("[=" and "=]") delimiters. For example, if 'a', 'à', and 'â' belong to the same equivalence class, then "[[=a=]b]", "[[=à=]b]", and "[[=â=]b]" are each equivalent to "[aàâb]". If the

collating element does not belong to an equivalence class, the equivalence class expression shall be treated as a *collating symbol*.

6. A *character class expression* shall represent the set of characters belonging to a character class, as defined in the *LC_CTYPE* category in the current locale. All character classes specified in the current locale shall be recognized. A character class expression is expressed as a character class name enclosed within bracket-colon ("[:" and ":]") delimiters.

   The following character class expressions shall be supported in all locales:

   ```
   [:alnum:]   [:cntrl:]   [:lower:]   [:space:]
   [:alpha:]   [:digit:]   [:print:]   [:upper:]
   [:blank:]   [:graph:]   [:punct:]   [:xdigit:]
   ```

XSI In addition, character class expressions of the form:

   [:*name*:]

   are recognized in those locales where the *name* keyword has been given a **charclass** definition in the *LC_CTYPE* category.

7. A range expression represents the set of collating elements that fall between two elements in the collating element order of the current locale, inclusive. A range expression shall be expressed as the starting point and the ending point separated by a hyphen ('–').

   Range expressions shall not be used in portable applications because their behavior is dependent on the collating sequence.

   In the following, all examples assume the collation sequence specified for the POSIX locale, unless another collation sequence is specifically defined.

   The starting range point and the ending range point shall be a collating element or collating symbol. An equivalence class expression used as a starting or ending point of a range expression produces unspecified results. An equivalence class can be used portably within a bracket expression, but only outside the range. For example, the unspecified expression "[[=e=]–f]" should be given as "[[=e=]e–f]". The ending range point shall collate equal to or higher than the starting range point; otherwise, the expression is treated as invalid. The order used is the order in which the collating elements are specified in the current collation definition. One-to-many mappings (see the description of *LC_COLLATE* in Section 7.3.2 (on page 155)) are not performed. For example, assuming that the character eszet ('β') is placed in the collation sequence after 'r' and 's', but before 't' and that it maps to the sequence "ss" for collation purposes, then the expression "[r–s]" matches only 'r' and 's', but the expression "[s–t]" matches 's', 'β', or 't'.

   The interpretation of range expressions where the ending range point is also the starting range point of a subsequent range expression (for example, "[a–m–o]") is undefined.

   The hyphen character shall be treated as itself if it occurs first (after an initial '^', if any) or last in the list, or as an ending range point in a range expression. As examples, the expressions "[–ac]" and "[ac–]" are equivalent and match any of the characters 'a', 'c', or '–'; "[^–ac]" and "[^ac–]" are equivalent and match any characters except 'a', 'c', or '–'; the expression "[%––]" matches any of the characters between '%' and '–' inclusive; the expression "[––@]" matches any of the characters between '–' and '@' inclusive; and the expression "[a––@]" is invalid, because the letter 'a' follows the symbol '–' in the POSIX locale. To use a hyphen as the starting range point, it shall either come first in the bracket expression or be specified as a collating symbol; for example, "[][.–.]–0]", which matches either a right bracket or any character or collating element

that collates between hyphen and 0, inclusive.

If a bracket expression specifies both '−' and ']', the ']' shall be placed first (after the '^', if any) and the '−' last within the bracket expression.

9.3.6 BREs Matching Multiple Characters

The following rules can be used to construct BREs matching multiple characters from BREs matching a single character:

1. The concatenation of BREs shall match the concatenation of the strings matched by each component of the BRE.

2. A *subexpression* can be defined within a BRE by enclosing it between the character pairs "\(" and "\)". Such a subexpression shall match whatever it would have matched without the "\(" and "\)", except that anchoring within subexpressions is optional behavior; see Section 9.3.8 (on page 202). Subexpressions can be arbitrarily nested.

3. The *back-reference* expression '\n' shall match the same (possibly empty) string of characters as was matched by a subexpression enclosed between "\(" and "\)" preceding the '\n'. The character 'n' shall be a digit from 1 through 9, specifying the *n*th subexpression (the one that begins with the *n*th "\(" from the beginning of the pattern and ends with the corresponding paired "\)"). The expression is invalid if less than *n* subexpressions precede the '\n'. For example, the expression "\(.*\)\1$" matches a line consisting of two adjacent appearances of the same string, and the expression "\(a\)*\1" fails to match 'a'. When the referenced subexpression matched more than one string, the back-referenced expression shall refer to the last matched string. If the subexpression referenced by the back-reference matches more than one string because of an asterisk ('*') or an interval expression (see item (5)), the back-reference shall match the last (rightmost) of these strings.

4. When a BRE matching a single character, a subexpression, or a back-reference is followed by the special character asterisk ('*'), together with that asterisk it shall match what zero or more consecutive occurrences of the BRE would match. For example, "[ab]*" and "[ab][ab]" are equivalent when matching the string "ab".

5. When a BRE matching a single character, a subexpression, or a back-reference is followed by an *interval expression* of the format "\{m\}", "\{m,\}", or "\{m,n\}", together with that interval expression it shall match what repeated consecutive occurrences of the BRE would match. The values of *m* and *n* are decimal integers in the range $0 \le m \le n \le \{RE\_DUP\_MAX\}$, where *m* specifies the exact or minimum number of occurrences and *n* specifies the maximum number of occurrences. The expression "\{m\}" shall match exactly *m* occurrences of the preceding BRE, "\{m,\}" shall match at least *m* occurrences, and "\{m,n\}" shall match any number of occurrences between *m* and *n*, inclusive.

   For example, in the string "abababccccccd" the BRE "c\{3\}" is matched by characters '7' to '9', the BRE "\(ab\)\{4,\}" is not matched at all, and the BRE "c\{1,3\}d" is matched by characters ten to thirteen.

The behavior of multiple adjacent duplication symbols ('*' and intervals) produces undefined results.

A subexpression repeated by an asterisk ('*') or an interval expression shall not match a null expression unless this is the only match for the repetition or it is necessary to satisfy the exact or minimum number of occurrences for the interval expression.

9.3.7 BRE Precedence

The order of precedence shall be as shown in the following table:

BRE Precedence (from high to low)	
Collation-related bracket symbols	`[==] [::] [..]`
Escaped characters	`\<special character>`
Bracket expression	`[]`
Subexpressions / back-references	`\(\) \n`
Single-character-BRE duplication	`* \{m,n\}`
Concatenation	
Anchoring	`^ $`

9.3.8 BRE Expression Anchoring

A BRE can be limited to matching strings that begin or end a line; this is called *anchoring*. The circumflex and dollar sign special characters shall be considered BRE anchors in the following contexts:

1. A circumflex (`'^'`) shall be an anchor when used as the first character of an entire BRE. The implementation may treat the circumflex as an anchor when used as the first character of a subexpression. The circumflex shall anchor the expression (or optionally subexpression) to the beginning of a string; only sequences starting at the first character of a string shall be matched by the BRE. For example, the BRE `"^ab"` matches `"ab"` in the string `"abcdef"`, but fails to match in the string `"cdefab"`. The BRE `"\(^ab\)"` may match the former string. A portable BRE shall escape a leading circumflex in a subexpression to match a literal circumflex.

2. A dollar sign (`'$'`) shall be an anchor when used as the last character of an entire BRE. The implementation may treat a dollar sign as an anchor when used as the last character of a subexpression. The dollar sign shall anchor the expression (or optionally subexpression) to the end of the string being matched; the dollar sign can be said to match the end-of-string following the last character.

3. A BRE anchored by both `'^'` and `'$'` shall match only an entire string. For example, the BRE `"^abcdef$"` matches strings consisting only of `"abcdef"`.

9.4 Extended Regular Expressions

The *extended regular expression* (ERE) notation and construction rules shall apply to utilities defined as using extended regular expressions; any exceptions to the following rules are noted in the descriptions of the specific utilities using EREs.

9.4.1 EREs Matching a Single Character or Collating Element

An ERE ordinary character, a special character preceded by a backslash, or a period shall match a single character. A bracket expression shall match a single character or a single collating element. An *ERE matching a single character* enclosed in parentheses shall match the same as the ERE without parentheses would have matched.

9.4.2 ERE Ordinary Characters

An *ordinary character* is an ERE that matches itself. An ordinary character is any character in the supported character set, except for the ERE special characters listed in Section 9.4.3. The interpretation of an ordinary character preceded by a backslash (`'\'`) is undefined.

9.4.3 ERE Special Characters

An *ERE special character* has special properties in certain contexts. Outside those contexts, or when preceded by a backslash, such a character shall be an ERE that matches the special character itself. The extended regular expression special characters and the contexts in which they shall have their special meaning are as follows:

`. [ \ (` The period, left-bracket, backslash, and left-parenthesis shall be special except when used in a bracket expression (see Section 9.3.5 (on page 199)). Outside a bracket expression, a left-parenthesis immediately followed by a right-parenthesis produces undefined results.

`)` The right-parenthesis shall be special when matched with a preceding left-parenthesis, both outside a bracket expression.

`* + ? {` The asterisk, plus-sign, question-mark, and left-brace shall be special except when used in a bracket expression (see Section 9.3.5 (on page 199)). Any of the following uses produce undefined results:

- If these characters appear first in an ERE, or immediately following a vertical-line, circumflex, or left-parenthesis
- If a left-brace is not part of a valid interval expression (see Section 9.4.6 (on page 204))

`|` The vertical-line is special except when used in a bracket expression (see Section 9.3.5 (on page 199)). A vertical-line appearing first or last in an ERE, or immediately following a vertical-line or a left-parenthesis, or immediately preceding a right-parenthesis, produces undefined results.

`^` The circumflex shall be special when used as:

- An anchor (see Section 9.4.9 (on page 205))
- The first character of a bracket expression (see Section 9.3.5 (on page 199))

`$` The dollar sign shall be special when used as an anchor.

9.4.4 Periods in EREs

A period (`'.'`), when used outside a bracket expression, is an ERE that shall match any character in the supported character set except NUL.

9.4.5 ERE Bracket Expression

The rules for ERE Bracket Expressions are the same as for Basic Regular Expressions; see Section 9.3.5 (on page 199).

9.4.6 EREs Matching Multiple Characters

The following rules shall be used to construct EREs matching multiple characters from EREs matching a single character:

1. A *concatenation of EREs* shall match the concatenation of the character sequences matched by each component of the ERE. A concatenation of EREs enclosed in parentheses shall match whatever the concatenation without the parentheses matches. For example, both the ERE `"cd"` and the ERE `"(cd)"` are matched by the third and fourth character of the string `"abcdefabcdef"`.

2. When an ERE matching a single character or an ERE enclosed in parentheses is followed by the special character plus-sign (`'+'`), together with that plus-sign it shall match what one or more consecutive occurrences of the ERE would match. For example, the ERE `"b+(bc)"` matches the fourth to seventh characters in the string `"acabbbcde"`. And, `"[ab]+"` and `"[ab][ab]*"` are equivalent.

3. When an ERE matching a single character or an ERE enclosed in parentheses is followed by the special character asterisk (`'*'`), together with that asterisk it shall match what zero or more consecutive occurrences of the ERE would match. For example, the ERE `"b*c"` matches the first character in the string `"cabbbcde"`, and the ERE `"b*cd"` matches the third to seventh characters in the string `"cabbbcdebbbbbbcdbc"`. And, `"[ab]*"` and [ab][ab] are equivalent when matching the string `"ab"`.

4. When an ERE matching a single character or an ERE enclosed in parentheses is followed by the special character question-mark (`'?'`), together with that question-mark it shall match what zero or one consecutive occurrences of the ERE would match. For example, the ERE `"b?c"` matches the second character in the string `"acabbbcde"`.

5. When an ERE matching a single character or an ERE enclosed in parentheses is followed by an *interval expression* of the format `"{m}"`, `"{m,}"`, or `"{m,n}"`, together with that interval expression it shall match what repeated consecutive occurrences of the ERE would match. The values of *m* and *n* are decimal integers in the range $0 \le m \le n \le \{RE\_DUP\_MAX\}$, where *m* specifies the exact or minimum number of occurrences and *n* specifies the maximum number of occurrences. The expression `"{m}"` matches exactly *m* occurrences of the preceding ERE, `"{m,}"` matches at least *m* occurrences, and `"{m,n}"` matches any number of occurrences between *m* and *n*, inclusive.

   For example, in the string `"abababccccccd"` the ERE `"c{3}"` is matched by characters `'7'` to `'9'` and the ERE `"(ab){2,}"` is matched by characters one to six.

The behavior of multiple adjacent duplication symbols (`'+'`, `'*'`, `'?'`, and intervals) produces undefined results.

An ERE matching a single character repeated by an `'*'`, `'?'`, or an interval expression shall not match a null expression unless this is the only match for the repetition or it is necessary to satisfy the exact or minimum number of occurrences for the interval expression.

9.4.7 ERE Alternation

Two EREs separated by the special character vertical-line (`'|'`) shall match a string that is matched by either. For example, the ERE `"a((bc)|d)"` matches the string `"abc"` and the string `"ad"`. Single characters, or expressions matching single characters, separated by the vertical bar and enclosed in parentheses, shall be treated as an ERE matching a single character.

9.4.8 ERE Precedence

The order of precedence shall be as shown in the following table:

ERE Precedence (from high to low)	
Collation-related bracket symbols	`[==] [::] [..]`
Escaped characters	`\<special character>`
Bracket expression	`[]`
Grouping	`()`
Single-character-ERE duplication	`* + ? {m,n}`
Concatenation	
Anchoring	`^ $`
Alternation	`|`

For example, the ERE `"abba|cde"` matches either the string `"abba"` or the string `"cde"` (rather than the string `"abbade"` or `"abbcde"`, because concatenation has a higher order of precedence than alternation).

9.4.9 ERE Expression Anchoring

An ERE can be limited to matching strings that begin or end a line; this is called *anchoring*. The circumflex and dollar sign special characters shall be considered ERE anchors when used anywhere outside a bracket expression. This shall have the following effects:

1. A circumflex (`'^'`) outside a bracket expression shall anchor the expression or subexpression it begins to the beginning of a string; such an expression or subexpression can match only a sequence starting at the first character of a string. For example, the EREs `"^ab"` and `"(^ab)"` match `"ab"` in the string `"abcdef"`, but fail to match in the string `"cdefab"`, and the ERE `"a^b"` is valid, but can never match because the `'a'` prevents the expression `"^b"` from matching starting at the first character.

2. A dollar sign (`'$'`) outside a bracket expression shall anchor the expression or subexpression it ends to the end of a string; such an expression or subexpression can match only a sequence ending at the last character of a string. For example, the EREs `"ef$"` and `"(ef$)"` match `"ef"` in the string `"abcdef"`, but fail to match in the string `"cdefab"`, and the ERE `"e$f"` is valid, but can never match because the `'f'` prevents the expression `"e$"` from matching ending at the last character.

9.5 Regular Expression Grammar

Grammars describing the syntax of both basic and extended regular expressions are presented in this section. The grammar takes precedence over the text. See the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 1.10, Grammar Conventions.

9.5.1 BRE/ERE Grammar Lexical Conventions

The lexical conventions for regular expressions are as described in this section.

Except as noted, the longest possible token or delimiter beginning at a given point is recognized.

The following tokens are processed (in addition to those string constants shown in the grammar):

COLL_ELEM — Any single-character collating element, unless it is a META_CHAR.

BACKREF — Applicable only to basic regular expressions. The character string consisting of '\' followed by a single-digit numeral, '1' to '9'.

DUP_COUNT — Represents a numeric constant. It shall be an integer in the range 0 ≤DUP_COUNT ≤{RE_DUP_MAX}. This token is only recognized when the context of the grammar requires it. At all other times, digits not preceded by '\' are treated as ORD_CHAR.

META_CHAR — One of the characters:

- ^ When found first in a bracket expression
- – When found anywhere but first (after an initial '^', if any) or last in a bracket expression, or as the ending range point in a range expression
-] When found anywhere but first (after an initial '^', if any) in a bracket expression

L_ANCHOR — Applicable only to basic regular expressions. The character '^' when it appears as the first character of a basic regular expression and when not QUOTED_CHAR. The '^' may be recognized as an anchor elsewhere; see Section 9.3.8 (on page 202).

ORD_CHAR — A character, other than one of the special characters in SPEC_CHAR.

QUOTED_CHAR — In a BRE, one of the character sequences:

```
\^    \.    \*    \[    \$    \\
```

In an ERE, one of the character sequences:

```
\^    \.    \[    \$    \(    \)    \|
\*    \+    \?    \{    \\
```

R_ANCHOR — (Applicable only to basic regular expressions.) The character '$' when it appears as the last character of a basic regular expression and when not QUOTED_CHAR. The '$' may be recognized as an anchor elsewhere; see Section 9.3.8 (on page 202).

SPEC_CHAR — For basic regular expressions, one of the following special characters:

- . Anywhere outside bracket expressions
- \ Anywhere outside bracket expressions

[	Anywhere outside bracket expressions
^	When used as an anchor (see Section 9.3.8 (on page 202)) or when first in a bracket expression
$	When used as an anchor
*	Anywhere except first in an entire RE, anywhere in a bracket expression, directly following "\(", directly following an anchoring '^'

For extended regular expressions, shall be one of the following special characters found anywhere outside bracket expressions:

```
^    .    [    $    (    )    |
*    +    ?    {    \
```

(The close-parenthesis shall be considered special in this context only if matched with a preceding open-parenthesis.)

9.5.2 RE and Bracket Expression Grammar

This section presents the grammar for basic regular expressions, including the bracket expression grammar that is common to both BREs and EREs.

```
%token    ORD_CHAR QUOTED_CHAR DUP_COUNT

%token    BACKREF L_ANCHOR R_ANCHOR

%token    Back_open_paren  Back_close_paren
/*          '\('             '\)'        */

%token    Back_open_brace  Back_close_brace
/*          '\{'             '\}'         */

/* The following tokens are for the Bracket Expression
   grammar common to both REs and EREs. */

%token    COLL_ELEM META_CHAR

%token    Open_equal Equal_close Open_dot Dot_close Open_colon Colon_close
/*           '[='       '=]'        '[.'     '.]'      '[:'       ':]'  */

%token    class_name
/* class_name is a keyword to the LC_CTYPE locale category */
/* (representing a character class) in the current locale */
/* and is only recognized between [: and :] */

%start    basic_reg_exp
%%

                ;
single_expression : end_range
                | character_class
                | equivalence_class
                ;
range_expression : start_range end_range
                | start_range '-'
                ;
start_range     : end_range '-'
                ;
end_range       : COLL_ELEM
```

```
                | collating_symbol
                ;
collating_symbol : Open_dot COLL_ELEM Dot_close
                | Open_dot META_CHAR Dot_close
                ;
equivalence_class : Open_equal COLL_ELEM Equal_close
                ;
character_class : Open_colon class_name Colon_close
                ;
```

The BRE grammar does not permit L_ANCHOR or R_ANCHOR inside "\(" and "\)" (which implies that '^' and '$' are ordinary characters). This reflects the semantic limits on the application, as noted in Section 9.3.8 (on page 202). Implementations are permitted to extend the language to interpret '^' and '$' as anchors in these locations, and as such, portable applications cannot use unescaped '^' and '$' in positions inside "\(" and "\)" that might be interpreted as anchors.

9.5.3 ERE Grammar

This section presents the grammar for extended regular expressions, excluding the bracket expression grammar.

Note: The bracket expression grammar and the associated **%token** lines are identical between BREs and EREs. It has been omitted from the ERE section to avoid unnecessary editorial duplication.

```
%token  ORD_CHAR QUOTED_CHAR DUP_COUNT
%start  extended_reg_exp
%%

/* ----------------------------------------
   Extended Regular Expression
   ----------------------------------------
*/
extended_reg_exp   :                          ERE_branch
                   | extended_reg_exp '|' ERE_branch
                   ;
ERE_branch         :            ERE_expression
                   | ERE_branch ERE_expression
                   ;
ERE_expression     : one_character_ERE
                   | '^'
                   | '$'
                   | '(' extended_reg_exp ')'
                   | ERE_expression ERE_dupl_symbol
                   ;
one_character_ERE  : ORD_CHAR
                   | QUOTED_CHAR
                   | '.'
                   | bracket_expression
                   ;
ERE_dupl_symbol    : '*'
                   | '+'
                   | '?'
                   | '{' DUP_COUNT              '}'
```

```
                        | '{' DUP_COUNT ','           '}'
                        | '{' DUP_COUNT ',' DUP_COUNT '}'
                        ;
```

The ERE grammar does not permit several constructs that previous sections specify as having undefined results:

- ORD_CHAR preceded by '\'
- One or more *ERE_dupl_symbol*s appearing first in an ERE, or immediately following '|', '^', or '('
- '{' not part of a valid *ERE_dupl_symbol*
- '|' appearing first or last in an ERE, or immediately following '|' or '(', or immediately preceding ')'

Implementations are permitted to extend the language to allow these. Portable applications cannot use such constructs.

Chapter 10

Directory Structure and Devices

10.1 Directory Structure and Files

The following directories shall exist on conforming systems and portable applications shall make use of them only as described. Portable applications shall not assume the ability to create files in any of these directories, unless specified below.

/ The root directory.

/dev Contains **/dev/console**, **/dev/null**, and **/dev/tty**, described below.

The following directory shall exist on conforming systems and shall be used as described.

/tmp A directory made available for programs that need a place to create temporary files. Applications are allowed to create files in this directory, but cannot assume that such files are preserved between invocations of the application.

The following files shall exist on conforming systems and shall be both readable and writable.

/dev/null An infinite data source and data sink. Data written to **/dev/null** shall be discarded. Reads from **/dev/null** shall always return end-of-file (EOF).

/dev/tty In each process, a synonym for the controlling terminal associated with the process group of that process, if any. It is useful for programs or shell procedures that wish to be sure of writing messages to or reading data from the terminal no matter how output has been redirected. It can also be used for programs that demand the name of a file for output, when typed output is desired and it is tiresome to find out what terminal is currently in use.

The following file shall exist on conforming systems and need not be readable or writable:

/dev/console The **/dev/console** file is a generic name given to the system console. It is usually linked to a particular machine-dependent special file. It shall provide a basic I/O interface to the system console.

10.2 Output Devices and Terminal Types

The utilities in the Shell and Utilities volume of IEEE Std. 1003.1-200x historically have been implemented on a wide range of terminal types, but a conforming implementation need not support all features of all utilities on every conceivable terminal. IEEE Std. 1003.1-200x states which features are optional for certain classes of terminals in the individual utility description sections. The implementation shall document which terminal types it supports and which of these features and utilities are not supported by each terminal.

When a feature or utility is not supported on a specific terminal type, as allowed by IEEE Std. 1003.1-200x, and the implementation considers such a condition to be an error preventing use of the feature or utility, the implementation shall indicate such conditions through diagnostic messages or exit status values or both (as appropriate to the specific utility description) that inform the user that the terminal type lacks the appropriate capability.

IEEE Std. 1003.1-200x uses a notational convention based on historical practice that identifies some of the control characters defined in Section 7.3.1 (on page 147) in a manner easily

remembered by users on many terminals. The correspondence between this ''<control>-*char*'' notation and the actual control characters is shown in the following table. When IEEE Std. 1003.1-200x refers to a character by its <control>- *name*, it is referring to the actual control character shown in the Value column of the table, which is not necessarily the exact control key sequence on all terminals. Some terminals have keyboards that do not allow the direct transmission of all the non-alphanumeric characters shown. In such cases, the system documentation shall describe which data sequences transmitted by the terminal are interpreted by the system as representing the special characters.

Table 10-1 Control Character Names

Name	Value	Symbolic Name	Name	Value	Symbolic Name
<control>-A	<SOH>	<SOH>	<control>-Q	<DC1>	<DC1>
<control>-B	<STX>	<STX>	<control>-R	<DC2>	<DC2>
<control>-C	<ETX>	<ETX>	<control>-S	<DC3>	<DC3>
<control>-D	<EOT>	<EOT>	<control>-T	<DC4>	<DC4>
<control>-E	<ENQ>	<ENQ>	<control>-U	<NAK>	<NAK>
<control>-F	<ACK>	<ACK>	<control>-V	<SYN>	<SYN>
<control>-G	<BEL>	<alert>	<control>-W	<ETB>	<ETB>
<control>-H	<BS>	<backspace>	<control>-X	<CAN>	<CAN>
<control>-I	<HT>	<tab>	<control>-Y	<EM>	<EM>
<control>-J	<LF>	<linefeed>	<control>-Z	<SUB>	<SUB>
<control>-K	<VT>	<vertical-tab>	<control>-[	<ESC>	<ESC>
<control>-L	<FF>	<form-feed>	<control>-\	<FS>	<FS>
<control>-M	<CR>	<carriage-return>	<control>-]	<GS>	<GS>
<control>-N	<SO>	<SO>	<control>-^	<RS>	<RS>
<control>-O	<SI>	<SI>	<control>-_	<US>	<US>
<control>-P	<DLE>	<DLE>	<control>-?	<DEL>	<DEL>

Note: The notation uses uppercase letters for arbitrary editorial reasons. There is no implication that the keystrokes represent control-shift-letter sequences.

Chapter 11

General Terminal Interface

This chapter describes a general terminal interface that shall be provided. It shall be supported on any asynchronous communications ports if the implementation provides them. It is implementation-defined whether it supports network connections or synchronous ports, or both.

11.1 Interface Characteristics

11.1.1 Opening a Terminal Device File

When a terminal device file is opened, it normally causes the thread to wait until a connection is established. In practice, application programs seldom open these files; they are opened by special programs and become an application's standard input, output, and error files.

As described in *open*( ), opening a terminal device file with the O_NONBLOCK flag clear shall cause the thread to block until the terminal device is ready and available. If CLOCAL mode is not set, this means blocking until a connection is established. If CLOCAL mode is set in the terminal, or the O_NONBLOCK flag is specified in the *open*( ), the *open*( ) function shall return a file descriptor without waiting for a connection to be established.

11.1.2 Process Groups

A terminal may have a foreground process group associated with it. This foreground process group plays a special role in handling signal-generating input characters, as discussed in Section 11.1.9 (on page 217).

A command interpreter process supporting job control can allocate the terminal to different jobs, or process groups, by placing related processes in a single process group and associating this process group with the terminal. A terminal's foreground process group may be set or examined by a process, assuming the permission requirements are met; see *tcgetpgrp*( ) and *tcsetpgrp*( ). The terminal interface aids in this allocation by restricting access to the terminal by processes that are not in the current process group; see Section 11.1.4 (on page 214).

When there is no longer any process whose process ID or process group ID matches the process group ID of the foreground process group, the terminal shall have no foreground process group. It is unspecified whether the terminal has a foreground process group when there is a process whose process ID matches the foreground process ID, but whose process group ID does not. No actions defined in IEEE Std. 1003.1-200x, other than allocation of a controlling terminal or a successful call to *tcsetpgrp*( ), cause a process group to become the foreground process group of the terminal.

11.1.3 The Controlling Terminal

A terminal may belong to a process as its controlling terminal. Each process of a session that has a controlling terminal has the same controlling terminal. A terminal may be the controlling terminal for at most one session. The controlling terminal for a session is allocated by the session leader in an implementation-defined manner. If a session leader has no controlling terminal, and opens a terminal device file that is not already associated with a session without using the O_NOCTTY option (see *open*( )), it is implementation-defined whether the terminal becomes the controlling terminal of the session leader. If a process which is not a session leader opens a terminal file, or the O_NOCTTY option is used on *open*( ), then that terminal shall not become the controlling terminal of the calling process. When a controlling terminal becomes associated with a session, its foreground process group shall be set to the process group of the session leader.

The controlling terminal is inherited by a child process during a *fork*( ) function call. A process relinquishes its controlling terminal when it creates a new session with the *setsid*( ) function; other processes remaining in the old session that had this terminal as their controlling terminal continue to have it. Upon the close of the last file descriptor in the system (whether or not it is in the current session) associated with the controlling terminal, it is unspecified whether all processes that had that terminal as their controlling terminal cease to have any controlling terminal. Whether and how a session leader can reacquire a controlling terminal after the controlling terminal has been relinquished in this fashion is unspecified. A process does not relinquish its controlling terminal simply by closing all of its file descriptors associated with the controlling terminal if other processes continue to have it open.

When a controlling process terminates, the controlling terminal is dissociated from the current session, allowing it to be acquired by a new session leader. Subsequent access to the terminal by other processes in the earlier session may be denied, with attempts to access the terminal treated as if a modem disconnect had been sensed.

11.1.4 Terminal Access Control

If a process is in the foreground process group of its controlling terminal, read operations shall be allowed, as described in Section 11.1.5 (on page 215). Any attempts by a process in a background process group to read from its controlling terminal cause its process group to be sent a SIGTTIN signal unless one of the following special cases applies: if the reading process is ignoring or blocking the SIGTTIN signal, or if the process group of the reading process is orphaned, the *read*( ) returns –1, with *errno* set to [EIO] and no signal is sent. The default action of the SIGTTIN signal is to stop the process to which it is sent. See **<signal.h>**.

If a process is in the foreground process group of its controlling terminal, write operations shall be allowed as described in Section 11.1.8 (on page 217). Attempts by a process in a background process group to write to its controlling terminal shall cause the process group to be sent a SIGTTOU signal unless one of the following special cases applies: if TOSTOP is not set, or if TOSTOP is set and the process is ignoring or blocking the SIGTTOU signal, the process is allowed to write to the terminal and the SIGTTOU signal is not sent. If TOSTOP is set, and the process group of the writing process is orphaned, and the writing process is not ignoring or blocking the SIGTTOU signal, the *write*( ) returns –1, with *errno* set to [EIO] and no signal is sent.

Certain calls that set terminal parameters are treated in the same fashion as *write*( ), except that TOSTOP is ignored; that is, the effect is identical to that of terminal writes when TOSTOP is set (see Section 11.2.5 (on page 223), *tcdrain*( ), *tcflow*( ), *tcflush*( ), *tcsendbreak*( ), *tcsetattr*( ), and *tcsetpgrp*( )).

11.1.5 Input Processing and Reading Data

A terminal device associated with a terminal device file may operate in full-duplex mode, so that data may arrive even while output is occurring. Each terminal device file has an *input queue*, associated with it, into which incoming data is stored by the system before being read by a process. The system may impose a limit, {MAX_INPUT}, on the number of bytes that may be stored in the input queue. The behavior of the system when this limit is exceeded is implementation-defined.

Two general kinds of input processing are available, determined by whether the terminal device file is in canonical mode or non-canonical mode. These modes are described in Section 11.1.6 and Section 11.1.7 (on page 216). Additionally, input characters are processed according to the **c_iflag** (see Section 11.2.2 (on page 219)) and **c_lflag** (see Section 11.2.5 (on page 223)) fields. Such processing can include *echoing*, which in general means transmitting input characters immediately back to the terminal when they are received from the terminal. This is useful for terminals that can operate in full-duplex mode.

The manner in which data is provided to a process reading from a terminal device file is dependent on whether the terminal file is in canonical or non-canonical mode, and on whether or not the O_NONBLOCK flag is set by *open*( ) or *fcntl*( ).

If the O_NONBLOCK flag is clear, then the read request shall be blocked until data is available or a signal has been received. If the O_NONBLOCK flag is set, then the read request shall be completed, without blocking, in one of three ways:

1. If there is enough data available to satisfy the entire request, the *read*( ) shall complete successfully and shall return the number of bytes read.
2. If there is not enough data available to satisfy the entire request, the *read*( ) shall complete successfully, having read as much data as possible, and shall return the number of bytes it was able to read.
3. If there is no data available, the *read*( ) shall return −1, with *errno* set to [EAGAIN].

When data is available depends on whether the input processing mode is canonical or non-canonical. The following sections, Section 11.1.6 and Section 11.1.7 (on page 216), describe each of these input processing modes.

11.1.6 Canonical Mode Input Processing

In canonical mode input processing, terminal input is processed in units of lines. A line is delimited by a newline character (NL), an end-of-file character (EOF), or an end-of-line (EOL) character. See Section 11.1.9 (on page 217) for more information on EOF and EOL. This means that a read request shall not return until an entire line has been typed or a signal has been received. Also, no matter how many bytes are requested in the *read*( ) call, at most one line shall be returned. It is not, however, necessary to read a whole line at once; any number of bytes, even one, may be requested in a *read*( ) without losing information.

If {MAX_CANON} is defined for this terminal device, it is a limit on the number of bytes in a line. The behavior of the system when this limit is exceeded is implementation-defined. If {MAX_CANON} is not defined, there is no such limit; see *pathconf*( ).

Erase and kill processing occur when either of two special characters, the ERASE and KILL characters (see Section 11.1.9 (on page 217)), is received. This processing affects data in the input queue that has not yet been delimited by a newline (NL), EOF, or EOL character. This un-delimited data makes up the current line. The ERASE character deletes the last character in the current line, if there is one. The KILL character deletes all data in the current line, if there are any. The ERASE and KILL characters have no effect if there is no data in the current line. The ERASE

7012 and KILL characters themselves are not placed in the input queue.

7013 11.1.7 Non-Canonical Mode Input Processing

7014 In non-canonical mode input processing, input bytes are not assembled into lines, and erase and
7015 kill processing do not occur. The values of the MIN and TIME members of the **c_cc** array are
7016 used to determine how to process the bytes received. The IEEE Std. 1003.1-200x does not specify
7017 whether the setting of O_NONBLOCK takes precedence over MIN or TIME settings. Therefore,
7018 if O_NONBLOCK is set, *read*( ) may return immediately, regardless of the setting of MIN or
7019 TIME. Also, if no data is available, *read*( ) may either return 0, or return –1 with *errno* set to
7020 [EAGAIN].

7021 MIN represents the minimum number of bytes that should be received when the *read*( ) function
7022 returns successfully. TIME is a timer of 0.1 second granularity that is used to time out bursty and
7023 short-term data transmissions. If MIN is greater than {MAX_INPUT}, the response to the request
7024 is undefined. The four possible values for MIN and TIME and their interactions are described
7025 below.

7026 **Case A: MIN>0, TIME>0**

7027 In case A, TIME serves as an inter-byte timer and is activated after the first byte is received. Since |
7028 it is an inter-byte timer, it is reset after a byte is received. The interaction between MIN and
7029 TIME is as follows. As soon as one byte is received, the inter-byte timer is started. If MIN bytes
7030 are received before the inter-byte timer expires (remember that the timer is reset upon receipt of
7031 each byte), the read is satisfied. If the timer expires before MIN bytes are received, the characters
7032 received to that point are returned to the user. Note that if TIME expires at least one byte is
7033 returned because the timer would not have been enabled unless a byte was received. In this case
7034 (MIN>0, TIME>0) the read shall block until the MIN and TIME mechanisms are activated by the
7035 receipt of the first byte, or a signal is received. If the data is in the buffer at the time of the *read*( ),
7036 the result shall be as if the data has been received immediately after the *read*( ).

7037 **Case B: MIN>0, TIME=0**

7038 In case B, since the value of TIME is zero, the timer plays no role and only MIN is significant. A |
7039 pending read is not satisfied until MIN bytes are received (that is, the pending read shall block |
7040 until MIN bytes are received), or a signal is received. A program that uses case B to read record- |
7041 based terminal I/O may block indefinitely in the read operation. |

7042 **Case C: MIN=0, TIME>0**

7043 In case C, since MIN=0, TIME no longer represents an inter-byte timer. It now serves as a read |
7044 timer that is activated as soon as the *read*( ) function is processed. A read is satisfied as soon as a |
7045 single byte is received or the read timer expires. Note that in case C if the timer expires, no bytes |
7046 are returned. If the timer does not expire, the only way the read can be satisfied is if a byte is |
7047 received. If bytes are not received, the read shall not block indefinitely waiting for a byte; if no |
7048 byte is received within TIME*0.1 seconds after the read is initiated, the *read*( ) returns a value of |
7049 zero, having read no data. If the data is in the buffer at the time of the *read*( ), the timer shall be
7050 started as if the data has been received immediately after the *read*( ).

Case D: MIN=0, TIME=0

The minimum of either the number of bytes requested or the number of bytes currently available shall be returned without waiting for more bytes to be input. If no characters are available, *read*( ) shall return a value of zero, having read no data.

11.1.8 Writing Data and Output Processing

When a process writes one or more bytes to a terminal device file, they are processed according to the **c_oflag** field (see Section 11.2.3 (on page 220)). The implementation may provide a buffering mechanism; as such, when a call to *write*( ) completes, all of the bytes written have been scheduled for transmission to the device, but the transmission has not necessarily completed. See *write*( ) for the effects of O_NONBLOCK on *write*( ).

11.1.9 Special Characters

Certain characters have special functions on input or output or both. These functions are summarized as follows:

INTR Special character on input, which is recognized if the ISIG flag is set. Generates a SIGINT signal which is sent to all processes in the foreground process group for which the terminal is the controlling terminal. If ISIG is set, the INTR character is discarded when processed.

QUIT Special character on input, which is recognized if the ISIG flag is set. Generates a SIGQUIT signal which is sent to all processes in the foreground process group for which the terminal is the controlling terminal. If ISIG is set, the QUIT character is discarded when processed.

ERASE Special character on input, which is recognized if the ICANON flag is set. Erases the last character in the current line; see Section 11.1.6 (on page 215). It shall not erase beyond the start of a line, as delimited by an NL, EOF, or EOL character. If ICANON is set, the ERASE character is discarded when processed.

KILL Special character on input, which is recognized if the ICANON flag is set. Deletes the entire line, as delimited by an NL, EOF, or EOL character. If ICANON is set, the KILL character is discarded when processed.

EOF Special character on input, which is recognized if the ICANON flag is set. When received, all the bytes waiting to be read are immediately passed to the process without waiting for a newline, and the EOF is discarded. Thus, if there are no bytes waiting (that is, the EOF occurred at the beginning of a line), a byte count of zero shall be returned from the *read*( ), representing an end-of-file indication. If ICANON is set, the EOF character is discarded when processed.

NL Special character on input, which is recognized if the ICANON flag is set. It is the line delimiter newline. It cannot be changed.

EOL Special character on input, which is recognized if the ICANON flag is set. It is an additional line delimiter, like NL.

SUSP If the ISIG flag is set, receipt of the SUSP character causes a SIGTSTP signal to be sent to all processes in the foreground process group for which the terminal is the controlling terminal, and the SUSP character is discarded when processed.

STOP Special character on both input and output, which is recognized if the IXON (output control) or IXOFF (input control) flag is set. Can be used to suspend output temporarily. It is useful with CRT terminals to prevent output from disappearing

7095 before it can be read. If IXON is set, the STOP character is discarded when processed.

7096 START Special character on both input and output, which is recognized if the IXON (output
7097 control) or IXOFF (input control) flag is set. Can be used to resume output that has
7098 been suspended by a STOP character. If IXON is set, the START character is discarded
7099 when processed.

7100 CR Special character on input, which is recognized if the ICANON flag is set; it is the
7101 carriage-return character. When ICANON and ICRNL are set and IGNCR is not set,
7102 this character is translated into an NL, and has the same effect as an NL character.

7103 The NL and CR characters cannot be changed. It is implementation-defined whether the START
7104 and STOP characters can be changed. The values for INTR, QUIT, ERASE, KILL, EOF, EOL, and
7105 SUSP shall be changeable to suit individual tastes. Special character functions associated with
7106 changeable special control characters can be disabled individually.

7107 If two or more special characters have the same value, the function performed when that
7108 character is received is undefined.

7109 A special character is recognized not only by its value, but also by its context; for example, an
7110 implementation may support multi-byte sequences that have a meaning different from the
7111 meaning of the bytes when considered individually. Implementations may also support
7112 additional single-byte functions. These implementation-defined multi-byte or single-byte
7113 functions are recognized only if the IEXTEN flag is set; otherwise, data is received without
7114 interpretation, except as required to recognize the special characters defined in this section.

7115 XSI If IEXTEN is set, the ERASE, KILL, and EOF characters can be escaped by a preceding '\'
7116 character, in which case no special function occurs.

7117 11.1.10 Modem Disconnect

7118 If a modem disconnect is detected by the terminal interface for a controlling terminal, and if
7119 CLOCAL is not set in the **c_cflag** field for the terminal (see Section 11.2.4 (on page 222)), the
7120 SIGHUP signal is sent to the controlling process for which the terminal is the controlling
7121 terminal. Unless other arrangements have been made, this causes the controlling process to
7122 terminate (see *exit*( )). Any subsequent read from the terminal device shall return the value of
7123 zero, indicating end-of-file; see *read*( ). Thus, processes that read a terminal file and test for end-
7124 of-file can terminate appropriately after a disconnect. If the EIO condition as specified in *read*( )
7125 also exists, it is unspecified whether on EOF condition or the [EIO] is returned. Any subsequent
7126 *write*( ) to the terminal device returns –1, with *errno* set to [EIO], until the device is closed.

7127 11.1.11 Closing a Terminal Device File

7128 The last process to close a terminal device file shall cause any output to be sent to the device and
7129 any input to be discarded. If HUPCL is set in the control modes and the communications port
7130 supports a disconnect function, the terminal device shall perform a disconnect.

11.2 Parameters that Can be Set

11.2.1 The termios Structure

Routines that need to control certain terminal I/O characteristics shall do so by using the **termios** structure as defined in the **<termios.h>** header. The members of this structure include (but are not limited to):

Member Type	Array Size	Member Name	Description
tcflag_t		**c_iflag**	Input modes.
tcflag_t		**c_oflag**	Output modes.
tcflag_t		**c_cflag**	Control modes.
tcflag_t		**c_lflag**	Local modes.
cc_t	NCCS	**c_cc**[ ]	Control characters.

The types **tcflag_t** and **cc_t** are defined in the **<termios.h>** header. They shall be unsigned integer types.

11.2.2 Input Modes

Values of the **c_iflag** field describe the basic terminal input control, and are composed of the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in this table are defined in **<termios.h>**:

Mask Name	Description
BRKINT	Signal interrupt on break.
ICRNL	Map CR to NL on input.
IGNBRK	Ignore break condition.
IGNCR	Ignore CR.
IGNPAR	Ignore characters with parity errors.
INLCR	Map NL to CR on input.
INPCK	Enable input parity check.
ISTRIP	Strip character.
XSI IXANY	Enable any character to restart output.
IXOFF	Enable start/stop input control.
IXON	Enable start/stop output control.
PARMRK	Mark parity errors.

In the context of asynchronous serial data transmission, a break condition is defined as a sequence of zero-valued bits that continues for more than the time to send one byte. The entire sequence of zero-valued bits is interpreted as a single break condition, even if it continues for a time equivalent to more than one byte. In contexts other than asynchronous serial data transmission, the definition of a break condition is implementation-defined.

If IGNBRK is set, a break condition detected on input is ignored; that is, not put on the input queue and therefore not read by any process. If IGNBRK is not set and BRKINT is set, the break condition shall flush the input and output queues, and if the terminal is the controlling terminal of a foreground process group, the break condition shall generate a single SIGINT signal to that foreground process group. If neither IGNBRK nor BRKINT is set, a break condition is read as a single 0x00, or if PARMRK is set, as 0xff 0x00 0x00.

If IGNPAR is set, a byte with a framing or parity error (other than break) is ignored.

If PARMRK is set, and IGNPAR is not set, a byte with a framing or parity error (other than break) is given to the application as the three-byte sequence 0xff 0x00 X, where 0xff 0x00 is a two-byte flag preceding each sequence and X is the data of the byte received in error. To avoid ambiguity in this case, if ISTRIP is not set, a valid byte of 0xff is given to the application as 0xff 0xff. If neither PARMRK nor IGNPAR is set, a framing or parity error (other than break) is given to the application as a single byte 0x00.

If INPCK is set, input parity checking is enabled. If INPCK is not set, input parity checking is disabled, allowing output parity generation without input parity errors. Note that whether input parity checking is enabled or disabled is independent of whether parity detection is enabled or disabled (see Section 11.2.4 (on page 222)). If parity detection is enabled but input parity checking is disabled, the hardware to which the terminal is connected shall recognize the parity bit, but the terminal special file shall not check whether or not this bit is correctly set.

If ISTRIP is set, valid input bytes are first stripped to seven bits; otherwise, all eight bits are processed.

If INLCR is set, a received NL character is translated into a CR character. If IGNCR is set, a received CR character is ignored (not read). If IGNCR is not set and ICRNL is set, a received CR character is translated into an NL character.

XSI If IXANY is set, any input character shall restart output that has been suspended.

If IXON is set, start/stop output control is enabled. A received STOP character shall suspend output and a received START character shall restart output. When IXON is set, START and STOP characters are not read, but merely perform flow control functions. When IXON is not set, the START and STOP characters are read.

If IXOFF is set, start/stop input control is enabled. The system shall transmit STOP characters, which are intended to cause the terminal device to stop transmitting data, as needed to prevent the input queue from overflowing and causing implementation-defined behavior, and shall transmit START characters, which are intended to cause the terminal device to resume transmitting data, as soon as the device can continue transmitting data without risk of overflowing the input queue. The precise conditions under which STOP and START characters are transmitted are implementation-defined.

The initial input control value after *open*( ) is implementation-defined.

11.2.3 Output Modes

The **c_oflag** field specifies the terminal interface's treatment of output, and is composed of the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in this table are defined in **<termios.h>**:

Mask Name	Description
OPOST	Perform output processing.
XSI ONLCR	Map NL to CR-NL on output.
OCRNL	Map CR to NL on output.
ONOCR	No CR output at column 0.
ONLRET	NL performs CR function.
OFILL	Use fill characters for delay.
OFDEL	Fill is DEL, else NUL.
NLDLY	Select newline delays:
NL0	Newline character type 0.
NL1	Newline character type 1.
CRDLY	Select carriage-return delays:
CR0	Carriage-return delay type 0.
CR1	Carriage-return delay type 1.
CR2	Carriage-return delay type 2.
CR3	Carriage-return delay type 3.
TABDLY	Select horizontal-tab delays:
TAB0	Horizontal-tab delay type 0.
TAB1	Horizontal-tab delay type 1.
TAB2	Horizontal-tab delay type 2.
TAB3	Expand tabs to spaces.
BSDLY	Select backspace delays:
BS0	Backspace-delay type 0.
BS1	Backspace-delay type 1.
VTDLY	Select vertical-tab delays:
VT0	Vertical-tab delay type 0.
VT1	Vertical-tab delay type 1.
FFDLY	Select form-feed delays:
FF0	Form-feed delay type 0.
FF1	Form-feed delay type 1.

If OPOST is set, output data is post-processed as described below, so that lines of text are modified to appear appropriately on the terminal device; otherwise, characters are transmitted without change.

XSI If ONLCR is set, the NL character shall be transmitted as the CR-NL character pair. If OCRNL is set, the CR character shall be transmitted as the NL character. If ONOCR is set, no CR character shall be transmitted when at column 0 (first position). If ONLRET is set, the NL character is assumed to do the carriage-return function; the column pointer shall be set to 0 and the delays specified for CR shall be used. Otherwise, the NL character is assumed to do just the line-feed function; the column pointer remains unchanged. The column pointer shall also be set to 0 if the CR character is actually transmitted.

The delay bits specify how long transmission stops to allow for mechanical or other movement when certain characters are sent to the terminal. In all cases a value of 0 indicates no delay. If OFILL is set, fill characters are transmitted for delay instead of a timed delay. This is useful for high baud rate terminals which need only a minimal delay. If OFDEL is set, the fill character is DEL; otherwise, NUL.

If a form-feed or vertical-tab delay is specified, it lasts for about 2 seconds.

New-line delay lasts about 0.10 seconds. If ONLRET is set, the carriage-return delays are used instead of the newline delays. If OFILL is set, two fill characters are transmitted.

Carriage-return delay type 1 is dependent on the current column position, type 2 is about 0.10 seconds, and type 3 is about 0.15 seconds. If OFILL is set, delay type 1 transmits two fill characters, and type 2, four fill characters.

Horizontal-tab delay type 1 is dependent on the current column position. Type 2 is about 0.10 seconds. Type 3 specifies that tabs shall be expanded into spaces. If OFILL is set, two fill characters are transmitted for any delay.

Backspace delay lasts about 0.05 seconds. If OFILL is set, one fill character is transmitted.

The actual delays depend on line speed and system load.

The initial output control value after *open*( ) is implementation-defined.

11.2.4 Control Modes

The **c_cflag** field describes the hardware control of the terminal, and is composed of the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in this table are defined in **<termios.h>**; not all values specified are required to be supported by the underlying hardware:

Mask Name	Description
CLOCAL	Ignore modem status lines.
CREAD	Enable receiver.
CSIZE	Number of bits transmitted or received per byte:
CS5	5 bits
CS6	6 bits
CS7	7 bits
CS8	8 bits.
CSTOPB	Send two stop bits, else one.
HUPCL	Hang up on last close.
PARENB	Parity enable.
PARODD	Odd parity, else even.

In addition, the input and output baud rates are stored in the **termios** structure. The following values are supported:

Name	Description	Name	Description
B0	Hang up	B600	600 baud
B50	50 baud	B1200	1200 baud
B75	75 baud	B1800	1800 baud
B110	110 baud	B2400	2400 baud
B134	134.5 baud	B4800	4800 baud
B150	150 baud	B9600	9600 baud
B200	200 baud	B19200	19200 baud
B300	300 baud	B38400	38400 baud

The following functions are provided for getting and setting the values of the input and output baud rates in the **termios** structure: *cfgetispeed*( ), *cfgetospeed*( ), *cfsetispeed*( ), and *cfsetospeed*( ). The effects on the terminal device do not become effective and not all errors are detected until the *tcsetattr*( ) function is successfully called.

The CSIZE bits specify the number of transmitted or received bits per byte. If ISTRIP is not set, the value of all the other bits is unspecified. If ISTRIP is set, the value of all but the 7 low-order bits is zero, but the value of any other bits beyond CSIZE is unspecified when read. CSIZE does not include the parity bit, if any. If CSTOPB is set, two stop bits are used; otherwise, one stop

bit. For example, at 110 baud, two stop bits are normally used.

If CREAD is set, the receiver is enabled; otherwise, no characters shall be received.

If PARENB is set, parity generation and detection is enabled and a parity bit is added to each byte. If parity is enabled, PARODD specifies odd parity if set; otherwise, even parity is used.

If HUPCL is set, the modem control lines for the port are lowered when the last process with the port open closes the port or the process terminates. The modem connection shall be broken.

If CLOCAL is set, a connection does not depend on the state of the modem status lines. If CLOCAL is clear, the modem status lines shall be monitored.

Under normal circumstances, a call to the *open*( ) function shall wait for the modem connection to complete. However, if the O_NONBLOCK flag is set (see *open*( )) or if CLOCAL has been set, the *open*( ) function shall return immediately without waiting for the connection.

If the object for which the control modes are set is not an asynchronous serial connection, some of the modes may be ignored; for example, if an attempt is made to set the baud rate on a network connection to a terminal on another host, the baud rate may or may not be set on the connection between that terminal and the machine to which it is directly connected.

The initial hardware control value after *open*( ) is implementation-defined.

11.2.5 Local Modes

The **c_lflag** field of the argument structure is used to control various functions. It is composed of the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in this table are defined in **<termios.h>**; not all values specified are required to be supported by the underlying hardware:

Mask Name	Description
ECHO	Enable echo.
ECHOE	Echo ERASE as an error correcting backspace.
ECHOK	Echo KILL.
ECHONL	Echo <newline>.
ICANON	Canonical input (erase and kill processing).
IEXTEN	Enable extended (implementation-defined) functions.
ISIG	Enable signals.
NOFLSH	Disable flush after interrupt, quit or suspend.
TOSTOP	Send SIGTTOU for background output.

If ECHO is set, input characters are echoed back to the terminal. If ECHO is clear, input characters are not echoed.

If ECHOE and ICANON are set, the ERASE character shall cause the terminal to erase, if possible, the last character in the current line from the display. If there were no character to erase, an implementation might echo an indication that this was the case, or do nothing.

If ECHOK and ICANON are set, the KILL character shall either cause the terminal to erase the line from the display or shall echoe the newline character after the KILL character.

If ECHONL and ICANON are set, the newline character shall be echoed even if ECHO is not set.

If ICANON is set, canonical processing is enabled. This enables the erase and kill edit functions, and the assembly of input characters into lines delimited by NL, EOF, and EOL, as described in Section 11.1.6 (on page 215).

If ICANON is not set, read requests are satisfied directly from the input queue. A read shall not be satisfied until at least MIN bytes have been received or the timeout value TIME expired between bytes. The time value represents tenths of a second. See Section 11.1.7 (on page 216) for more details.

If IEXTEN is set, implementation-defined functions are recognized from the input data. It is implementation-defined how IEXTEN being set interacts with ICANON, ISIG, IXON, or IXOFF. If IEXTEN is not set, implementation-defined functions shall not be recognized and the corresponding input characters are processed as described for ICANON, ISIG, IXON, and IXOFF.

If ISIG is set, each input character is checked against the special control characters INTR, QUIT, and SUSP. If an input character matches one of these control characters, the function associated with that character is performed. If ISIG is not set, no checking is done. Thus these special input functions are possible only if ISIG is set.

If NOFLSH is set, the normal flush of the input and output queues associated with the INTR, QUIT, and SUSP characters shall not be done.

If TOSTOP is set, the signal SIGTTOU is sent to the process group of a process that tries to write to its controlling terminal if it is not in the foreground process group for that terminal. This signal, by default, stops the members of the process group. Otherwise, the output generated by that process is output to the current output stream. Processes that are blocking or ignoring SIGTTOU signals are excepted and allowed to produce output, and the SIGTTOU signal is not sent.

The initial local control value after *open*( ) is implementation-defined.

11.2.6 Special Control Characters

The special control characters values are defined by the array **c_cc**. The subscript name and description for each element in both canonical and non-canonical modes are as follows:

Subscript Usage		
Canonical Mode	**Non-Canonical Mode**	**Description**
VEOF		EOF character
VEOL		EOL character
VERASE		ERASE character
VINTR	VINTR	INTR character
VKILL		KILL character
	VMIN	MIN value
VQUIT	VQUIT	QUIT character
VSUSP	VSUSP	SUSP character
	VTIME	TIME value
VSTART	VSTART	START character
VSTOP	VSTOP	STOP character

The subscript values are unique, except that the VMIN and VTIME subscripts may have the same values as the VEOF and VEOL subscripts, respectively.

Implementations that do not support changing the START and STOP characters may ignore the character values in the **c_cc** array indexed by the VSTART and VSTOP subscripts when *tcsetattr*( ) is called, but shall return the value in use when *tcgetattr*( ) is called.

The initial values of all control characters are implementation-defined.

If the value of one of the changeable special control characters (see Section 11.1.9 (on page 217)) is _POSIX_VDISABLE, that function shall be disabled; that is, no input data is recognized as the disabled special character. If ICANON is not set, the value of _POSIX_VDISABLE has no special meaning for the VMIN and VTIME entries of the **c_cc** array.

7396

Chapter 12

Utility Conventions

12.1 Utility Argument Syntax

This section describes the argument syntax of the standard utilities and introduces terminology used throughout IEEE Std. 1003.1-200x for describing the arguments processed by the utilities.

Within IEEE Std. 1003.1-200x, a special notation is used for describing the syntax of a utility's arguments. Unless otherwise noted, all utility descriptions use this notation, which is illustrated by this example (see the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section 2.9.1, Simple Commands):

```
utility_name[-a][-b][-c option_argument]
    [-d|-e][-foption_argument][operand...]
```

The notation used for the SYNOPSIS sections imposes requirements on the implementors of the standard utilities and provides a simple reference for the application developer or system user.

1. The utility in the example is named *utility_name*. It is followed by *options*, *option-arguments*, and *operands*. The arguments that consist of hyphens and single letters or digits, such as `'a'`, are known as *options* (or, historically, *flags*). Certain options are followed by an *option-argument*, as shown with [**–c** *option_argument*]. The arguments following the last options and option-arguments are named *operands*.

2. Option-arguments are sometimes shown separated from their options by <blank> characters, sometimes directly adjacent. This reflects the situation that in some cases an option-argument is included within the same argument string as the option; in most cases it is the next argument. The Utility Syntax Guidelines in Section 12.2 (on page 229) require that the option be a separate argument from its option-argument, but there are some exceptions in IEEE Std. 1003.1-200x to ensure continued operation of historical applications:

   a. If the SYNOPSIS of a standard utility shows a space character between an option and option-argument (as with [**–c** *option_argument*] in the example), a portable application shall use separate arguments for that option and its option-argument.

   b. If a space character is not shown (as with [**–f***option_argument*] in the example), a portable application shall place an option and its option-argument directly adjacent in the same argument string, without intervening <blank> characters.

   c. Notwithstanding the preceding requirements on portable applications, a conforming system shall permit, but shall not require, an application to specify options and option-arguments as separate arguments whether or not a space character is shown on the synopsis line, except in those cases (marked with the XSI portability warning) where an option-argument is optional and no separation can be used.

   d. A standard utility may also be implemented to operate correctly when the required separation into multiple arguments is violated by a non-portable application.

   In summary, the following table shows allowable combinations:

	SYNOPSIS Shows:		
	–a *arg*	–b*arg*	–c[*arg*]
Portable application shall use:	–a *arg*	–b*arg*	N/A
System shall support:	–a *arg*	–b*arg*	–c*arg* or –c
System may support:	–a*arg*	–b *arg*	

3. Options are usually listed in alphabetical order unless this would make the utility description more confusing. There are no implied relationships between the options based upon the order in which they appear, unless otherwise stated in the OPTIONS section, or unless the exception in Guideline 11 of Section 12.2 (on page 229) applies. If an option that does not have option-arguments is repeated, the results are undefined, unless otherwise stated.

4. Frequently, names of parameters that require substitution by actual values are shown with embedded underscores. Alternatively, parameters are shown as follows:

   <*parameter name*>

   The angle brackets are used for the symbolic grouping of a phrase representing a single parameter and portable applications shall not include them in data submitted to the utility.

5. When a utility has only a few permissible options, they are sometimes shown individually, as in the example. Utilities with many flags generally show all of the individual flags (that do not take option-arguments) grouped, as in:

   utility_name [–abcDxyz**][**–p *arg***][***operand***]**

   Utilities with very complex arguments may be shown as follows:

   utility_name [options**][***operands***]**

6. Unless otherwise specified, whenever an operand or option-argument is, or contains, a numeric value:

   - The number is interpreted as a decimal integer.
   - Numerals in the range 0 to 2 147 483 647 are syntactically recognized as numeric values.
   - When the utility description states that it accepts negative numbers as operands or option-arguments, numerals in the range –2 147 483 647 to 2 147 483 647 are syntactically recognized as numeric values.
   - Ranges greater than those listed here are allowed.

   This does not mean that all numbers within the allowable range are necessarily semantically correct. A standard utility that accepts an option-argument or operand that is to be interpreted as a number, and for which a range of values smaller than that shown above is permitted by the IEEE Std. 1003.1-200x, describes that smaller range along with the description of the option-argument or operand. If an error is generated, the utility's diagnostic message shall indicate that the value is out of the supported range, not that it is syntactically incorrect.

7. Arguments or option-arguments enclosed in the '[' and ']' notation are optional and can be omitted. Portable applications shall not include the '[' and ']' symbols in data submitted to the utility.

8. Arguments separated by the '|' vertical bar notation are mutually-exclusive. Portable applications shall not include the '|' symbol in data submitted to the utility. Alternatively, mutually-exclusive options and operands may be listed with multiple

synopsis lines. For example:

```
utility_name –d[–a][–c option_argument][operand...]
utility_name[–a][–b][operand...]
```

When multiple synopsis lines are given for a utility, it is an indication that the utility has mutually-exclusive arguments. These mutually-exclusive arguments alter the functionality of the utility so that only certain other arguments are valid in combination with one of the mutually-exclusive arguments. Only one of the mutually-exclusive arguments is allowed for invocation of the utility. Unless otherwise stated in an accompanying OPTIONS section, the relationships between arguments depicted in the SYNOPSIS sections are mandatory requirements placed on portable applications. The use of conflicting mutually-exclusive arguments produces undefined results, unless a utility description specifies otherwise. When an option is shown without the '[' and ']' brackets, it means that option is required for that version of the SYNOPSIS. However, it is not required to be the first argument, as shown in the example above, unless otherwise stated.

9. Ellipses ("...") are used to denote that one or more occurrences of an option or operand are allowed. When an option or an operand followed by ellipses is enclosed in brackets, zero or more options or operands can be specified. The forms:

```
utility_name –f option_argument...[operand...]
utility_name [–g option_argument]...[operand...]
```

indicate that multiple occurrences of the option and its option-argument preceding the ellipses are valid, with semantics as indicated in the OPTIONS section of the utility. (See also Guideline 11 in Section 12.2.) In the first example, each option-argument requires a preceding **–f** and at least one **–f** *option_argument* must be given.

10. When the synopsis line is too long to be printed on a single line in the Shell and Utilities volume of IEEE Std. 1003.1-200x, the indented lines following the initial line are continuation lines. An actual use of the command would appear on a single logical line.

12.2 Utility Syntax Guidelines

The following guidelines are established for the naming of utilities and for the specification of options, option-arguments, and operands. The *getopt*( ) function in the System Interfaces volume of IEEE Std. 1003.1-200x assists utilities in handling options and operands that conform to these guidelines.

Operands and option-arguments can contain characters not specified in the portable character set.

The guidelines are intended to provide guidance to the authors of future utilities, such as those written specific to a local system or that are components of a larger application. Some of the standard utilities do not conform to all of these guidelines; in those cases, the OPTIONS sections describe the deviations.

Guideline 1: Utility names should be between two and nine characters, inclusive.

Guideline 2: Utility names should include lowercase letters (the **lower** character classification) and digits only from the portable character set.

Guideline 3: Each option name should be a single alphanumeric character (the **alnum** character classification) from the portable character set.

Multi-digit options are not allowed.

Guideline 4: All options should be preceded by the '–' delimiter character.

Guideline 5: Options without option-arguments should be accepted when grouped behind one '–' delimiter.

Guideline 6: Each option and option-argument should be a separate argument, except as noted in Section 12.1 (on page 227), item (2).

Guideline 7: Option-arguments should not be optional.

Guideline 8: When multiple option-arguments are specified to follow a single option, they should be presented as a single argument, using commas within that argument or <blank> characters within that argument to separate them.

Guideline 9: All options should precede operands on the command line.

Guideline 10: The argument –– should be accepted as a delimiter indicating the end of options. Any following arguments should be treated as operands, even if they begin with the '–' character. The –– argument should not be used as an option or as an operand.

Guideline 11: The order of different options relative to one another should not matter, unless the options are documented as mutually-exclusive and such an option is documented to override any incompatible options preceding it. If an option that has option-arguments is repeated, the option and option-argument combinations should be interpreted in the order specified on the command line.

Guideline 12: The order of operands may matter and position-related interpretations should be determined on a utility-specific basis.

Guideline 13: For utilities that use operands to represent files to be opened for either reading or writing, the '–' operand should be used only to mean standard input (or standard output when it is clear from context that an output file is being specified).

The utilities in the Shell and Utilities volume of IEEE Std. 1003.1-200x that claim conformance to these guidelines shall conform completely to these guidelines as if these guidelines contained the term ''shall'' instead of ''should''. On some systems, the utilities accept usage in violation of these guidelines for backward compatibility as well as accepting the required form.

It is recommended that all future utilities and applications use these guidelines to enhance user portability. The fact that some historical utilities could not be changed (to avoid breaking existing applications) should not deter this future goal.

7555 # Chapter 13 Headers

7556 This chapter describes the contents of headers.

7557 Headers contain function prototypes, the definition of symbolic constants, common structures,
7558 preprocessor macros, and defined types. Each function in the System Interfaces volume of
7559 IEEE Std. 1003.1-200x specifies the headers that an application shall include in order to use that
7560 function. In most cases, only one header is required. These headers are present on an application
7561 development system; they need not be present on the target execution system.

7562 ## 13.1 Format of Entries

7563 The entries in this chapter are based on a common format as follows. The only sections relating
7564 to conformance are the SYNOPSIS and DESCRIPTION.

7565 **NAME**
7566 This section gives the name or names of the entry and briefly states its purpose.

7567 **SYNOPSIS**
7568 This section summarizes the use of the entry being described.

7569 **DESCRIPTION**
7570 This section describes the functionality of the header.

7571 **APPLICATION USAGE**
7572 This section is non-normative.

7573 This section gives warnings and advice to application writers about the entry. In the
7574 event of conflict between warnings and advice and a normative part of this volume of
7575 IEEE Std. 1003.1-200x, the normative material is to be taken as correct.

7576 **RATIONALE**
7577 This section is non-normative.

7578 This section contains historical information concerning the contents of this volume of
7579 IEEE Std. 1003.1-200x and why features were included or discarded by the standard
7580 developers.

7581 **FUTURE DIRECTIONS**
7582 This section is non-normative.

7583 This section provides comments which should be used as a guide to current thinking;
7584 there is not necessarily a commitment to adopt these future directions.

7585 **SEE ALSO**
7586 This section is non-normative.

7587 This section gives references to related information.

7588 **CHANGE HISTORY**
7589 This section is non-normative.

7590 This section shows the derivation of the entry and any significant changes that have
7591 been made to it.

NAME

aio.h — asynchronous input and output (**REALTIME**)

SYNOPSIS

AIO

```
#include <aio.h>
```

DESCRIPTION

The **<aio.h>** header shall define the **aiocb** structure which shall include at least the following members:

`int`	`aio_fildes`	File descriptor.
`off_t`	`aio_offset`	File offset.
`volatile void *`	`aio_buf`	Location of buffer.
`size_t`	`aio_nbytes`	Length of transfer.
`int`	`aio_reqprio`	Request priority offset.
`struct sigevent`	`aio_sigevent`	Signal number and value.
`int`	`aio_lio_opcode`	Operation to be performed.

This header shall also include the following constants:

AIO_CANCELED — A return value indicating that all requested operations have been canceled.

AIO_NOTCANCELED — A return value indicating that some of the requested operations could not be canceled since they are in progress.

AIO_ALLDONE — A return value indicating that none of the requested operations could be canceled since they are already complete.

LIO_WAIT — A *lio_listio*( ) synchronization operation indicating that the calling thread is to suspend until the *lio_listio*( ) operation is complete.

LIO_NOWAIT — A *lio_listio*( ) synchronization operation indicating that the calling thread is to continue execution while the *lio_listio*( ) operation is being performed, and no notification is given when the operation is complete.

LIO_READ — A *lio_listio*( ) element operation option requesting a read.

LIO_WRITE — A *lio_listio*( ) element operation option requesting a write.

LIO_NOP — A *lio_listio*( ) element operation option indicating that no transfer is requested.

The following shall be declared as functions and may also be declared as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
int      aio_cancel(int, struct aiocb *);
int      aio_error(const struct aiocb *);
int      aio_fsync(int, struct aiocb *);
int      aio_read(struct aiocb *);
ssize_t  aio_return(struct aiocb *);
int      aio_suspend(const struct aiocb *const[], int,
             const struct timespec *);
int      aio_write(struct aiocb *);
int      lio_listio(int, struct aiocb *restrict const[restrict], int,
             struct sigevent *restrict);
```

Inclusion of the **<aio.h>** header may make visible symbols defined in the headers **<fcntl.h>**, **<signal.h>**, **<sys/types.h>**, and **<time.h>**.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<fcntl.h>, **<signal.h>**, **<sys/types.h>**, **<time.h>**, the System Interfaces volume of IEEE Std. 1003.1-200x, *fsync*( ), *lseek*( ), *read*( ), *write*( )

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The **<aio.h>** header is marked as part of the Asynchronous Input and Output option. |

The description of the constants is expanded. |

The **restrict** keyword is added to the prototype for *lio_listio*( ). |

7653 **NAME**

7654 arpa/inet.h — definitions for internet operations

7655 **SYNOPSIS**

7656
```
#include <arpa/inet.h>
```

7657 **DESCRIPTION**

7658 The **in_port_t** and **in_addr_t** types shall be defined as described in **<netinet/in.h>**.

7659 The **in_addr** structure shall be defined as described in **<netinet/in.h>**.

7660 7661 The INET_ADDRSTRLEN and INET6_ADDRSTRLEN macros shall be defined as described in **<netinet/in.h>**.

7662 7663 The following shall be declared as functions, defined as macros, or both. If functions are declared, function prototypes shall be provided for use with an ISO C standard compiler.

7664 7665 7666 7667
```
uint32_t htonl(uint32_t);
uint16_t htons(uint16_t);
uint32_t ntohl(uint32_t);
uint16_t ntohs(uint16_t);
```

7668 The **uint32_t** and **uint16_t** types shall be defined as described in **<inttypes.h>**.

7669 7670 The following shall be declared as functions, and may also be defined as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

7671 7672 7673 7674 7675 7676 IP6 7677 7678 7679
```
in_addr_t       inet_addr(const char *);
in_addr_t       inet_lnaof(struct in_addr);
struct in_addr  inet_makeaddr(in_addr_t, in_addr_t);
in_addr_t       inet_netof(struct in_addr);
in_addr_t       inet_network(const char *);
char           *inet_ntoa(struct in_addr);
const char     *inet_ntop(int, const void *restrict, char *restrict,
                    socklen_t);
int             inet_pton(int, const char *restrict, void *restrict);
```

7680

7681 7682 Inclusion of the **<arpa/inet.h>** header may also make visible all symbols from **<netinet/in.h>** and **<inttypes.h>**.

7683 **APPLICATION USAGE**

7684 None.

7685 **RATIONALE**

7686 None.

7687 **FUTURE DIRECTIONS**

7692 **CHANGE HISTORY**

7693 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

7694 The **restrict** keyword is added to the prototypes for *inet_ntop*( ) and *inet_pton*( ).

NAME

assert.h — verify program assertion

SYNOPSIS

```
#include <assert.h>
```

DESCRIPTION

CX The functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of symbols in this header.

The **<assert.h>** header shall define the *assert*( ) macro. It refers to the macro NDEBUG which is not defined in the header. If NDEBUG is defined as a macro name before the inclusion of this header, the *assert*( ) macro is defined simply as:

```
#define assert(ignore)((void) 0)
```

Otherwise, the macro behaves as described in *assert*( ).

The *assert*( ) macro is redefined according to the current state of NDEBUG each time **<assert.h>** is included.

The *assert*( ) macro is implemented as a macro, not as a function. If the macro definition is suppressed in order to access an actual function, the behavior is undefined.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The System Interfaces volume of IEEE Std. 1003.1-200x, *assert*( )

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The definition of the *assert*( ) macro is changed for alignment with the ISO/IEC 9899:1999 standard.

NAME

complex.h — complex arithmetic

SYNOPSIS

```
#include <complex.h>
```

DESCRIPTION

CX The functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of symbols in this header.

The **<complex.h>** header shall define the following constants:

complex	Expands to *_Complex*.
_Complex_I	Expands to a constant expression of type **const float** *_Complex*, with the value of the imaginary unit (that is, a number such that $i^2=-1$).
imaginary	Expands to *_Imaginary*.
_Imaginary_I	Expands to a constant expression of type **const float** *_Imaginary* with the value of the imaginary unit.
I	Expands to either *_Imaginary_I* or *_Complex_I*. If *_Imaginary_I* is not defined, *I* expands to *_Complex_I*.

The constants *imaginary* and *_Imaginary_I* shall be defined if the implementation supports imaginary types.

An application may undefine and then, perhaps, redefine the *complex*, *imaginary*, and *I* constants.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
double       complex cacos(double complex);
float        complex cacosf(float complex);
long double  complex cacosl(long double complex);
double       complex casin(double complex);
float        complex casinf(float complex);
long double  complex casinl(long double complex);
double       complex catan(double complex);
float        complex catanf(float complex);
long double  complex catanl(long double complex);
double       complex ccos(double complex);
float        complex ccosf(float complex);
long double  complex ccosl(long double complex);
double       complex csin(double complex);
float        complex csinf(float complex);
long double  complex csinl(long double complex);
double       complex ctan(double complex);
float        complex ctanf(float complex);
long double  complex ctanl(long double complex);
double       complex cacosh(double complex);
float        complex cacoshf(float complex);
long double  complex cacoshl(long double complex);
double       complex casinh(double complex);
float        complex casinhf(float complex);
```

```
        long double  complex casinhl(long double complex);
        double       complex catanh(double complex);
        float        complex catanhf(float complex);
        long double  complex catanhl(long double complex);
        double       complex ccosh(double complex);
        float        complex ccoshf(float complex);
        long double  complex ccoshl(long double complex);
        double       complex csinh(double complex);
        float        complex csinhf(float complex);
        long double  complex csinhl(long double complex);
        double       complex catanh(double complex);
        float        complex catanhf(float complex);
        long double  complex catanhl(long double complex);
        double       complex cexp(double complex);
        float        complex cexpf(float complex);
        long double  complex cexpl(long double complex);
        double       complex clog(double complex);
        float        complex clogf(float complex);
        long double  complex clogl(long double complex);
        double       cabs(double complex);
        float        cabsf(float complex);
        long double  cabsl(long double complex);
        double       complex cpow(double complex, double complex);
        float        complex cpowf(float complex, float complex);
        long double  complex cpowl(long double complex, long double complex);
        double       complex csqrt(double complex);
        float        complex csqrtf(float complex);
        long double  complex csqrtl(long double complex);
        double       carg(double complex);
        float        cargf(float complex);
        long double  cargl(long double complex);
        double       cimag(double complex);
        float        cimagf(float complex);
        long double  cimagl(long double complex);
        double       complex conj(double complex);
        float        complex conjf(float complex);
        long double  complex conjl(long double complex);
        double       complex cproj(double complex);
        float        complex cprojf(float complex);
        long double  complex cprojl(long double complex);
        double       creal(double complex);
        float        crealf(float complex);
        long double  creall(long double complex);
```

APPLICATION USAGE

Values are interpreted as radians, not degrees. An implementation may set *errno*, but is not required to.

Some of the complex arithmetic functions have branch cuts, across which the function is discontinuous. For implementations with a signed zero (including all IEC 60559:1989 standard implementations), the sign of zero distinguishes one side of a cut from another so the function is continuous (except for format limitations) as the cut is approached from either side. For example, for the square root function, which has a branch cut along the negative real axis, the top of the cut, with imaginary part +0, maps to the positive imaginary axis, and the bottom of the cut, with imaginary part –0, maps to the negative imaginary axis.

Implementations that do not support a signed zero cannot distinguish the sides of branch cuts. These implementations shall map a cut so the function is continuous as the cut is approached coming around the finite endpoint of the cut in a counter-clockwise direction. (Branch cuts for the functions specified here have just one finite endpoint.) For example, for the square root function, coming counter-clockwise around the finite endpoint of the cut along the negative real axis approaches the cut from above, so the cut maps to the positive imaginary axis.

The usual mathematical formulas for complex multiply, divide, and absolute value are problematic because of their treatment of infinities and because of undue overflow and underflow. The CX_LIMITED_RANGE pragma can be used to inform the implementation that (where the state is on) the usual mathematical formulas are acceptable. The pragma can occur either outside external declarations or preceding all explicit declarations and statements inside a compound statement. When outside external declarations, the pragma takes effect from its occurrence until another CX_LIMITED_RANGE pragma is encountered, or until the end of the translation unit. When inside a compound statement, the pragma takes effect from its occurrence until another CX_LIMITED_RANGE pragma is encountered (including within a nested compound statement), or until the end of the compound statement; at the end of a compound statement the state for the pragma is restored to its condition just before the compound statement. If this pragma is used in any other context, the behavior is undefined. The default state for the pragma is off.

RATIONALE

The choice of *I* instead of *i* for the imaginary unit concedes to the widespread use of the identifier *i* for other purposes. The application can use a different identifier, say *j*, for the imaginary unit by following the inclusion of the **<complex.h>** header with:

```
#undef I
#define j _Imaginary_I
```

An *I* suffix to designate imaginary constants is not required, as multiplication by *I* provides a sufficiently convenient and more generally useful notation for imaginary terms. The corresponding real type for the imaginary unit is **float**, so that use of *I* for algorithmic or notational convenience will not result in widening types.

On systems with imaginary types, the application has the ability to control whether use of the macro *I* introduces an imaginary type, by explicitly defining *I* to be *_Imaginary_I* or *_Complex_I*. Disallowing imaginary types is useful for some applications intended to run on implementations without support for such types.

The macro *_Imaginary_I* provides a test for whether imaginary types are supported.

The *cis*( ) function (*cos*(*x*) + *I***sin*(*x*)) was considered but rejected because its implementation is easy and straightforward, even though some implementations could compute sine and cosine more efficiently in tandem.

FUTURE DIRECTIONS

The following function names and the same names suffixed with *f* or *l* are reserved for future use, and may be added to the declarations in the **<complex.h>** header.

cerf()	*cexpm1()*	*clog2()*
cerfc()	*clog10()*	*clgamma()*
cexp2()	*clog1p()*	*ctgamma()*

CHANGE HISTORY

First released in Issue 6. Included for alignment with the ISO / IEC 9899: 1999 standard.

NAME

cpio.h — cpio archive values

SYNOPSIS

XSI
```
#include <cpio.h>
```

DESCRIPTION

Values needed by the *c_mode* field of the *cpio* archive format are described as follows:

Name	Description	Value (Octal)
C_IRUSR	Read by owner.	0000400
C_IWUSR	Write by owner.	0000200
C_IXUSR	Execute by owner.	0000100
C_IRGRP	Read by group.	0000040
C_IWGRP	Write by group.	0000020
C_IXGRP	Execute by group.	0000010
C_IROTH	Read by others.	0000004
C_IWOTH	Write by others.	0000002
C_IXOTH	Execute by others.	0000001
C_ISUID	Set user ID.	0004000
C_ISGID	Set group ID.	0002000
C_ISVTX	On directories, restricted deletion flag.	0001000
C_ISDIR	Directory.	0040000
C_ISFIFO	FIFO.	0010000
C_ISREG	Regular file.	0100000
C_ISBLK	Block special.	0060000
C_ISCHR	Character special.	0020000
C_ISCTG	Reserved.	0110000
C_ISLNK	Symbolic link.	0120000
C_ISSOCK	Socket.	0140000

The header shall define the symbolic constant:

```
MAGIC    "070707"
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The Shell and Utilities volume of IEEE Std. 1003.1-200x, *pax*

CHANGE HISTORY

First released in Issue 3 of the Headers Interface, Issue 3 specification. Derived from the POSIX.1-1988 standard.

Issue 4, Version 2

Descriptions for C_ISLNK and C_ISSOCK are provided; formerly, these were listed as ‘‘Reserved’’.

Issue 6

The SEE ALSO is updated to refer to *pax*, since the *cpio* utility is not included in the Shell and Utilities volume of IEEE Std. 1003.1-200x.

NAME

ctype.h — character types

SYNOPSIS

```
#include <ctype.h>
```

DESCRIPTION

CX The functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of symbols in this header.

The **<ctype.h>** header shall declare the following as functions and may also define them as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
int   isalnum(int);
int   isalpha(int);
int   isascii(int);
int   isblank(int);
int   iscntrl(int);
int   isdigit(int);
int   isgraph(int);
int   islower(int);
int   isprint(int);
int   ispunct(int);
int   isspace(int);
int   isupper(int);
int   isxdigit(int);
int   toascii(int);
int   tolower(int);
int   toupper(int);
```

The following are defined as macros:

```
int   _toupper(int);
int   _tolower(int);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<locale.h>, the System Interfaces volume of IEEE Std. 1003.1-200x, *isalnum*( ), *isalpha*( ), *isascii*( ), *iscntrl*( ), *isdigit*( ), *isgraph*( ), *islower*( ), *isprint*( ), *ispunct*( ), *isspace*( ), *isupper*( ), *isxdigit*( ), *mblen*( ), *mbstowcs*( ), *mbtowc*( ), *setlocale*( ), *toascii*( ), *tolower*( ), *_tolower*( ), *toupper*( ), *_toupper*( ), *wcstombs*( ), *wctomb*( )

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The following change is incorporated for alignment with the ISO POSIX-1 standard:

- The function declarations in this header are expanded to full ISO C standard prototypes.

Issue 6

Extensions beyond the ISO C standard are now marked.

NAME

dirent.h — format of directory entries

SYNOPSIS

```
#include <dirent.h>
```

DESCRIPTION

The internal format of directories is unspecified.

The **<dirent.h>** header shall define the following data type through **typedef**:

DIR A type representing a directory stream.

It shall also define the structure **dirent** which shall include the following members:

XSI
```
ino_t  d_ino      File serial number.
char   d_name[]   Name of entry.
```

XSI The type **ino_t** shall be defined as described in **<sys/types.h>**.

The character array *d_name* is of unspecified size, but the number of bytes preceding the terminating null byte does not exceed {NAME_MAX}.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
int            closedir(DIR *);
DIR           *opendir(const char *);
struct dirent *readdir(DIR *);
```
TSF
```
int            readdir_r(DIR *restrict, struct dirent *restrict,
                   struct dirent **restrict);
```
```
void           rewinddir(DIR *);
```
XSI
```
void           seekdir(DIR *, long);
long           telldir(DIR *);
```

APPLICATION USAGE

None.

RATIONALE

Information similar to that in the **<dirent.h>** header is contained in a file **<sys/dir.h>** in 4.2 BSD and 4.3 BSD. The equivalent in these implementations of **struct dirent** from this volume of IEEE Std. 1003.1-200x is **struct direct**. The file name was changed because the name **<sys/dir.h>** was also used in earlier implementations to refer to definitions related to the older access method; this produced name conflicts. The name of the structure was changed because this volume of IEEE Std. 1003.1-200x does not completely define what is in the structure, so it could be different on some implementations from **struct direct**.

The name of an array of **char** of an unspecified size should not be used as an **lvalue**. Use of:

```
sizeof(d_name)
```

is incorrect; use:

```
strlen(d_name)
```

instead.

The array of **char** *d_name* is not a fixed size. Implementations may need to declare **struct dirent** with an array size for *d_name* of 1, but the actual number of characters provided matches (or only slightly exceeds) the length of the file name.

FUTURE DIRECTIONS

None.

SEE ALSO

<sys/types.h>, the System Interfaces volume of IEEE Std. 1003.1-200x, *closedir*( ), *opendir*( ), *readdir*( ), *readdir_r*( ), *rewinddir*( ), *seekdir*( ), *telldir*( )

CHANGE HISTORY

First released in Issue 2.

Issue 4

Reference to type **ino_t** is marked as an extension, as are references to the *seekdir*( ) and *telldir*( ) functions.

The following changes are incorporated for alignment with the ISO POSIX-1 standard:

- The function declarations in this header are expanded to full ISO C standard prototypes.
- A statement is added to the DESCRIPTION indicating that the internal format of directories is unspecified. Also in the description of the *d_name* field, the text is changed to indicate ‘‘bytes’’ rather than (possibly multi-byte) ‘‘characters’’.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

The Open Group corrigenda item U026/7 has been applied, correcting the prototype for *readdir_r*( ).

The **restrict** keyword is added to the prototype for *readdir_r*( ).

8035 **NAME**

8036 dlfcn.h — dynamic linking

8037 **SYNOPSIS**

8038 XSI
```
#include <dlfcn.h>
```
8039

8040 **DESCRIPTION**

8041 The **<dlfcn.h>** header shall define at least the following macros for use in the construction of a
8042 *dlopen*( ) *mode* argument:

8043	RTLD_LAZY	Relocations are performed at an implementation-defined time.
8044	RTLD_NOW	Relocations are performed when the object is loaded.
8045	RTLD_GLOBAL	All symbols are available for relocation processing of other modules.
8046 8047	RTLD_LOCAL	All symbols are not made available for relocation processing by other modules.

8048 The **<dlfcn.h>** header shall declare the following functions which may also be defined as
8049 macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
8050 int    dlclose(void *);
8051 char  *dlerror(void);
8052 void  *dlopen(const char *, int);
8053 void  *dlsym(void *restrict, const char *restrict);
```

8054 **APPLICATION USAGE**

8055 None.

8056 **RATIONALE**

8057 None.

8058 **FUTURE DIRECTIONS**

8059 None.

8060 **SEE ALSO**

8061 The System Interfaces volume of IEEE Std. 1003.1-200x, *dlopen*( ), *dlclose*( ), *dlsym*( ), *dlerror*( )

8062 **CHANGE HISTORY**

8063 First released in Issue 5.

8064 **Issue 6**

8065 The **restrict** keyword is added to the prototype for *dlsym*( ).

NAME

errno.h — system error numbers

SYNOPSIS

```
#include <errno.h>
```

DESCRIPTION

CX The functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of symbols in this header.

The **<errno.h>** header provides a declaration for *errno* and gives non-zero values for the following symbolic constants. Their values are unique except as noted below:

[E2BIG]	Argument list too long.
[EACCES]	Permission denied.
[EADDRINUSE]	Address in use.
[EADDRNOTAVAIL]	Address not available.
[EAFNOSUPPORT]	Address family not supported.
[EAGAIN]	Resource unavailable, try again (may be the same value as [EWOULDBLOCK]).
[EALREADY]	Connection already in progress.
[EBADF]	Bad file descriptor.
[EBADMSG]	Bad message.
[EBUSY]	Device or resource busy.
[ECANCELED]	Operation canceled.
[ECHILD]	No child processes.
[ECONNABORTED]	Connection aborted.
[ECONNREFUSED]	Connection refused.
[ECONNRESET]	Connection reset.
[EDEADLK]	Resource deadlock would occur.
[EDESTADDRREQ]	Destination address required.
[EDOM]	Mathematics argument out of domain of function.
[EDQUOT]	Reserved.
[EEXIST]	File exists.
[EFAULT]	Bad address.
[EFBIG]	File too large.
[EHOSTUNREACH]	Host is unreachable.
[EIDRM]	Identifier removed.
[EILSEQ]	Illegal byte sequence.

8103		[EINPROGRESS]	Operation in progress.
8104		[EINTR]	Interrupted function.
8105		[EINVAL]	Invalid argument.
8106		[EIO]	I/O error.
8107		[EISCONN]	Socket is connected.
8108		[EISDIR]	Is a directory.
8109		[ELOOP]	Too many levels of symbolic links.
8110		[EMFILE]	Too many open files.
8111		[EMLINK]	Too many links.
8112		[EMSGSIZE]	Message too large.
8113		[EMULTIHOP]	Reserved.
8114		[ENAMETOOLONG]	File name too long.
8115		[ENETDOWN]	Network is down.
8116		[ENETUNREACH]	Network unreachable.
8117		[ENFILE]	Too many files open in system.
8118		[ENOBUFS]	No buffer space available.
8119	XSI	[ENODATA]	No message is available on the STREAM head read queue.
8120		[ENODEV]	No such device.
8121		[ENOENT]	No such file or directory.
8122		[ENOEXEC]	Executable file format error.
8123		[ENOLCK]	No locks available.
8124		[ENOLINK]	Reserved.
8125		[ENOMEM]	Not enough space.
8126		[ENOMSG]	No message of the desired type.
8127		[ENOPROTOOPT]	Protocol not available.
8128		[ENOSPC]	No space left on device.
8129	XSI	[ENOSR]	No STREAM resources.
8130	XSI	[ENOSTR]	Not a STREAM.
8131		[ENOSYS]	Function not supported.
8132		[ENOTCONN]	The socket is not connected.
8133		[ENOTDIR]	Not a directory.
8134		[ENOTEMPTY]	Directory not empty.
8135		[ENOTSOCK]	Not a socket.
8136		[ENOTSUP]	Not supported.

[ENOTTY]	Inappropriate I/O control operation.		
[ENXIO]	No such device or address.		
[EOPNOTSUPP]	Operation not supported on socket.		
[EOVERFLOW]	Value too large to be stored in data type.		
[EPERM]	Operation not permitted.		
[EPIPE]	Broken pipe.		
[EPROTO]	Protocol error.		
[EPROTONOSUPPORT]	Protocol not supported.		
[EPROTOTYPE]	Socket type not supported.		
[ERANGE]	Result too large.		
[EROFS]	Read-only file system.		
[ESPIPE]	Invalid seek.		
[ESRCH]	No such process.		
[ESTALE]	Reserved.		
XSI [ETIME]	Stream *ioctl*( ) timeout.		
[ETIMEDOUT]	Connection timed out.		
[ETXTBSY]	Text file busy.		
[EWOULDBLOCK]	Operation would block (may be the same value as [EAGAIN]).		
[EXDEV]	Cross-device link.		

APPLICATION USAGE

Additional error numbers may be defined on conforming systems; see the System Interfaces volume of IEEE Std. 1003.1-200x.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The System Interfaces volume of IEEE Std. 1003.1-200x, Section 2.3, Error Numbers

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The [EILSEQ] error is added and marked as an EX interface.

The [ENOTBLK] error is withdrawn.

Issue 4, Version 2

The [EADDRINUSE], [EADDRNOTAVAIL], [EAFNOSUPPORT], [EALREADY], [EBADMSG], [ECONNABORTED], [ECONNREFUSED], [ECONNRESET], [EDESTADDRREQ], [EDQUOT], [EHOSTUNREACH], [EINPROGRESS], [EISCONN], [ELOOP], [EMSGSIZE], [EMULTIHOP], [ENETDOWN], [ENETUNREACH], [ENOBUFS], [ENODATA], [ENOLINK],

[ENOPROTOOPT], [ENOSR], [ENOSTR], [ENOTCONN], [ENOTSOCK], [EOPNOTSUPP], [EOVERFLOW], [EPROTO], [EPROTONOSUPPORT], [EPROTOTYPE], [ESTALE], [ETIME], [ETIMEDOUT], and [EWOULDBLOCK] errors are added in the UX context.

Issue 5

Updated for alignment with the POSIX Realtime Extension.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The majority of the error conditions previously marked as extensions are now mandatory, except for the STREAMS-related error conditions.

8186 **NAME**

8187 fcntl.h — file control options

8188 **SYNOPSIS**

8189 `#include <fcntl.h>`

8190 **DESCRIPTION**

8191 The **<fcntl.h>** header shall define the following requests and arguments for use by the functions
8192 *fcntl*( ) and *open*( ).

8193 Values for *cmd* used by *fcntl*( ) (the following values are unique) are as follows:

8194 F_DUPFD Duplicate file descriptor.

8195 F_GETFD Get file descriptor flags.

8196 F_SETFD Set file descriptor flags.

8197 F_GETFL Get file status flags and file access modes.

8198 F_SETFL Set file status flags.

8199 F_GETLK Get record locking information.

8200 F_SETLK Set record locking information.

8201 F_SETLKW Set record locking information; wait if blocked.

8202 F_GETOWN Get process or process group ID to receive SIGURG signals.

8203 F_SETOWN Set process or process group ID to receive SIGURG signals.

8204 File descriptor flags used for *fcntl*( ) are as follows:

8205 FD_CLOEXEC Close the file descriptor upon execution of an *exec* family function.

8206 Values for *l_type* used for record locking with *fcntl*( ) (the following values are unique) are as
8207 follows:

8208 F_RDLCK Shared or read lock.

8209 F_UNLCK Unlock.

8210 F_WRLCK Exclusive or write lock.

8211 XSI The values used for *l_whence*, {SEEK_SET}, {SEEK_CUR}, and {SEEK_END} shall be defined as
8212 described in **<unistd.h>**.

8213 The following four sets of values for *oflag* used by *open*( ) shall be bitwise-distinct:

8214 O_CREAT Create file if it does not exist.

8215 O_EXCL Exclusive use flag.

8216 O_NOCTTY Do not assign controlling terminal.

8217 O_TRUNC Truncate flag.

8218 File status flags used for *open*( ) and *fcntl*( ) are as follows:

8219 O_APPEND Set append mode.

8220 SIO O_DSYNC Write according to synchronized I/O data integrity completion.

8221 O_NONBLOCK Non-blocking mode.

8222 SIO O_RSYNC Synchronized read I/O operations.

8223 O_SYNC Write according to synchronized I/O file integrity completion.

8224 Mask for use with file access modes is as follows:

8225 O_ACCMODE Mask for file access modes.

8226 File access modes used for *open*( ) and *fcntl*( ) are as follows:

8227 O_RDONLY Open for reading only.

8228 O_RDWR Open for reading and writing.

8229 O_WRONLY Open for writing only.

8230 XSI The symbolic names for file modes for use as values of **mode_t** shall be defined as described in
8231 **<sys/stat.h>**.

8232 ADV Values for *advice* used by *posix_fadvise*( ) are as follows:

8233 POSIX_FADV_NORMAL
8234 The application has no advice to give on its behavior with respect to the specified data. It is
8235 the default characteristic if no advice is given for an open file.

8236 POSIX_FADV_SEQUENTIAL
8237 The application expects to access the specified data sequentially from lower offsets to
8238 higher offsets.

8239 POSIX_FADV_RANDOM
8240 The application expects to access the specified data in a random order.

8241 POSIX_FADV_WILLNEED
8242 The application expects to access the specified data in the near future.

8243 POSIX_FADV_DONTNEED
8244 The application expects that it will not access the specified data in the near future.

8245 POSIX_FADV_NOREUSE
8246 The application expects to access the specified data once and then not reuse it thereafter.
8247

8248 The structure **flock** describes a file lock. It shall include the following members:

8249 `short l_type` Type of lock; F_RDLCK, F_WRLCK, F_UNLCK.
8250 `short l_whence` Flag for starting offset.
8251 `off_t l_start` Relative offset in bytes.
8252 `off_t l_len` Size; if 0 then until EOF.
8253 `pid_t l_pid` Process ID of the process holding the lock; returned with F_GETLK.

8254 The **mode_t**, **off_t**, and **pid_t** types shall be defined as described in **<sys/types.h>**.

8255 The following shall be declared as functions and may also be defined as macros. Function
8256 prototypes shall be provided for use with an ISO C standard compiler.

```
8257 int  creat(const char *, mode_t);
8258 int  fcntl(int, int, ...);
8259 int  open(const char *, int, ...);
8260 ADV int  posix_fadvise(int, off_t, size_t, int);
8261 int  posix_fallocate(int, off_t, size_t);
```

8262

8263 XSI Inclusion of the **<fcntl.h>** header may also make visible all symbols from **<sys/stat.h>** and
8264 **<unistd.h>**.

8265 **APPLICATION USAGE**

8266 None.

8267 **RATIONALE**

8268 None.

8269 **FUTURE DIRECTIONS**

8270 None.

8271 **SEE ALSO**

8272 **<sys/stat.h>**, **<sys/types.h>**, **<unistd.h>**, the System Interfaces volume of IEEE Std. 1003.1-200x,
8273 *creat*( ), *exec*( ), *fcntl*( ), *open*( ), *posix_fadvise*( ), *posix_fallocate*( ), *posix_madvise*( )

8274 **CHANGE HISTORY**

8275 First released in Issue 1. Derived from Issue 1 of the SVID. |

8276 **Issue 4**

8277 A reference to **<unistd.h>** is added for the definition of *l_whence*, {SEEK_SET}, {SEEK_CUR}, and
8278 {SEEK_END}, and marked as an extension.

8279 A reference to **<sys/stat.h>** is added for the symbolic names of file modes used as values of
8280 **mode_t**, and marked as an extension.

8281 A reference to **<sys/types.h>** is added for the definition of **mode_t**, **off_t**, and **pid_t**, and marked
8282 as an extension.

8283 A warning is added indicating that inclusion of **<fcntl.h>** may also make visible all symbols
8284 from **<sys/stat.h>** and **<unistd.h>**. This is marked as an extension.

8285 The following change is incorporated for alignment with the ISO POSIX-1 standard:

8286 • The function declarations in this header are expanded to full ISO C standard prototypes.

8287 **Issue 5**

8288 The DESCRIPTION is updated for alignment with POSIX Realtime Extension.

8289 **Issue 6**

8290 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

8291 • O_DSYNC and O_RSYNC are marked as part of the Synchronized Input and Output option. |

8292 The following new requirements on POSIX implementations derive from alignment with the
8293 Single UNIX Specification:

8294 • The definition of the **mode_t**, **off_t**, and **pid_t** types is mandated.

8295 The F_GETOWN and F_SETOWN values are added for sockets.

8296 The *posix_fadvise*( ), *posix_fallocate*( ), and *posix_madvise*( ) functions are added for alignment with
8297 IEEE Std. 1003.1d-1999. |

8298 IEEE PASC Interpretation 1003.1 #102 is applied moving the prototype for *posix_madvise*( ) to |
8299 **<sys_mman.h>**. |

NAME

fenv.h — floating-point environment

SYNOPSIS

```
#include <fenv.h>
```

DESCRIPTION

CX The functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of symbols in this header.

The **<fenv.h>** header shall define the following data types through **typedef**:

fenv_t Represents the entire floating-point environment. The floating-point environment refers collectively to any floating-point status flags and control modes supported by the implementation.

fexcept_t Represents the floating-point status flags collectively, including any status the implementation associates with the flags. A floating-point status flag is a system variable whose value is set (but never cleared) when a floating-point exception is raised, which occurs as a side effect of exceptional floating-point arithmetic to provide auxiliary information. A floating-point control mode is a system variable whose value may be set by the user to affect the subsequent behavior of floating-point arithmetic.

The **<fenv.h>** header shall define the following constants:

FE_DIVBYZERO
FE_INEXACT
FE_INVALID
FE_OVERFLOW
FE_UNDERFLOW These constants are defined if and only if the implementation supports the floating-point exception by means of the flaoting-point functions *fwclearexcept*( ), *fegetexceptflag*( ), *feraiseexcept*( ), *fesetexceptflag*( ), and *fetestexcept*( ). Each expands to an integer constant expression with values such that bitwise-inclusive ORs of all combinations of the constants result in distinct values.

FE_ALL_EXCEPT Simply the bitwise-inclusive OR of all floating-point exception constants defined above.

FE_DOWNWARD
FE_TONEAREST
FE_TOWARDZERO
FE_UPWARD These constants are defined if and only if the implementation supports getting and setting the represented rounding direction by means of the *fegetround*( ) and *fesetround*( ) functions. Each expands to an integer constant expression whose values are distinct non-negative vales.

FE_DFL_ENV Represents the floating-point environment (that is, the one installed at program startup) and has type pointer to const-qualified **fenv_t**). It can be used as an argument to the functions within the **<fenv.h>** header that manage the floating-point environment.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
void  feclearexcept(int);
void  fegetexceptflag(fexcept_t *, int);
void  feraiseexcept(int);
void  fesetexceptflag(const fexcept_t *, int);
int   fetestexcept(int);
int   fegetround(void);
int   fesetround(int);
void  fegetenv(fenv_t *);
int   feholdexcept(fenv_t *);
void  fesetenv(const fenv_t *);
void  feupdateenv(const fenv_t *);
```

APPLICATION USAGE

This header is designed to support the floating-point exception status flags and directed-rounding control modes required by the IEC 60559:1989 standard, and other similar floating-point state information. Also it is designed to facilitate code portability among all systems.

Certain application programming conventions support the intended model of use for the floating-point environment:

- A function call does not alter its caller's floating-point control modes, clear its caller's floating-point status flags, nor depend on the state of its caller's floating-point status flags unless the function is so documented.
- A function call is assumed to require default floating-point control modes, unless its documentation promises otherwise.
- A function call is assumed to have the potential for raising floating-point exceptions, unless its documentation promises otherwise.

With these conventions, an application can safely assume default floating-point control modes (or be unaware of them). The responsibilities associated with accessing the floating-point environment fall on the application that does so explicitly.

Even though the rounding direction macros may expand to constants corresponding to the values of FLT_ROUNDS, they are not required to do so.

The FENV_ACCESS pragma provides a means to inform the implementation when an application might access the floating-point environment to test floating-point status flags or run under non-default floating-point control modes. The pragma shall occur either outside external declarations or preceding all explicit declarations and statements inside a compound statement. When outside external declarations, the pragma takes effect from its occurrence until another FENV_ACCESS pragma is encountered, or until the end of the translation unit. When inside a compound statement, the pragma takes effect from its occurrence until another FENV_ACCESS pragma is encountered (including within a nested compound statement), or until the end of the compound statement; at the end of a compound statement the state for the pragma is restored to its condition just before the compound statement. If this pragma is used in any other context, the behavior is undefined. If part of an application tests floating-point status flags, sets floating-point control modes, or runs under non-default mode settings, but was translated with the state for the FENV_ACCESS pragma off, the behavior is undefined. The default state (on or off) for the pragma is implementation-defined. (When execution passes from a part of the application translated with FENV_ACCESS off to a part translated with FENV_ACCESS on, the state of the floating-point status flags is unspecified and the floating-point control modes have their default settings.) For example:

```
#include <fenv.h>
void f(double x)
```

```
{
    #pragma STDC FENV_ACCESS ON
    void g(double);
    void h(double);
    /* ... */
    g(x + 1);
    h(x + 1);
    /* ... */
}
```

If the function *g*() might depend on status flags set as a side effect of the first *x*+1, or if the second *x*+1 might depend on control modes set as a side effect of the call to function *g*(), then the application shall contain an appropriately placed invocation as follows:

```
#pragma STDC FENV_ACCESS ON
```

RATIONALE

The floating-point environment as defined here includes only execution-time modes, not the myriad of possible translation-time options that can affect an application's results. Each such option's deviation from IEEE Std. 1003.1-200x should be well documented.

Dynamic Versus Static Modes

Dynamic modes are potentially problematic because:

1. The application may have to defend against undesirable mode settings, which impose intellectual as well as time and space overhead.
2. The translator may not know which mode settings will be in effect or which functions change them at execution time, which inhibits optimization.

The ISO/IEC 9899:1999 standard addresses these problems without changing the dynamic nature of the modes.

An alternate approach would have been to present a model of static modes with explicit utterances to the translator about what mode settings would be in effect. This would have avoided any uncertainty due to the global nature of dynamic modes or the dependency on unenforced conventions. However, some essentially dynamic mechanism still would have been needed in order to allow functions to inherit (honor) their caller's modes. The IEC 60559:1989 standard requires dynamic rounding direction modes. For the many architectures that maintain these modes in control registers, implementation of the static model would be more costly. Also, standard C has no facility, other than pragmas, for supporting static modes.

An implementation on an architecture that provides only static control of modes (for example, through opword encodings) still could support the dynamic model, by generating multiple code streams with tests of a private global variable containing the mode setting. Only modules under an enabling FENV_ACCESS pragma would need such special treatment.

Translation

An implementation is not required to provide a facility for altering the modes for translation-time arithmetic, or for making exception flags from the translation available to the executing application. The language and library provide facilities to cause floating-point operations to be done at execution time when they can be subjected to varying dynamic modes and their exceptions detected. The need does not seem sufficient to require similar facilities for translation.

The fexcept_t Type

fexcept_t does not have to be an integer type. Its values must be obtained by a call to *fegetexceptflag*( ), and cannot be created by logical operations from the exception macros. An implementation might simply implement **fexcept_** as an **int** and use the representations reflected by the exception macros, but is not required to; other representations might contain extra information about the exceptions. **fexcept_t** might be a **struct** with a member for each exception (that might hold the address of the first or last floating-point instruction that caused that exception). The ISO / IEC 9899: 1999 standard makes no claims about the internals of an **fexcept_t**, and so the user cannot inspect it.

Exception and Rounding Macros

Unsupported macros are not defined in order to ensure that their use results in a translation error. An application might explicitly define such macros to allow translation of code (perhaps never executed) containing the macros. An unsupported exception macro should be defined to be 0; for example:

```
#ifndef FE_INEXACT
#define FE_INEXACT 0
#endif
```

so that a bitwise-inclusive OR of macros has a reasonable effect.

Exceptions

In previous drafts of IEEE Std. 1003.1-200x, several of the exception functions returned an **int** indicating whether the *excepts* argument represented supported exceptions. This facility was deemed unnecessary because:

```
excepts & ~FE_ALL_EXCEPT
```

can be used to test invalidity of the *excepts* argument.

Rounding Precision

The IEC 60559: 1989 standard floating-point standard prescribes rounding precision modes (in addition to the rounding direction modes covered by the functions in this reference page) as a means for systems whose results are always double or extended to mimic systems that deliver results to narrower formats. An implementation of C can meet this goal in any of the following ways:

1. By supporting the evaluation method indicated by FLT_EVAL_METHOD equal to 0
2. By providing pragmas or compile options to shorten results by rounding to the IEC 60559: 1989 standard single or double precision
3. By providing functions to dynamically set and get rounding precision modes which shorten results by rounding to the IEC 60559: 1989 standard single or double precision; recommended are functions *fesetprec*( ) and *fegetprec*( ) and macros FE_FLTPREC, FE_DBLPREC, and FE_LDBLPREC, analogous to the functions and macros for the rounding direction modes

IEEE Std. 1003.1-200x does not include a portable interface for precision control because the IEC 60559: 1989 standard floating-point standard is ambivalent on whether it intends for precision control to be dynamic (like the rounding direction modes) or static. Indeed, some floating-point architectures provide control modes suitable for a dynamic mechanism, and others rely on instructions to deliver single and double-format results suitable only for a static

mechanism.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Included for alignment with the ISO / IEC 9899: 1999 standard.

NAME

float.h — floating types

SYNOPSIS

```
#include <float.h>
```

DESCRIPTION

CX The functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of symbols in this header.

The characteristics of floating types are defined in terms of a model that describes a representation of floating-point numbers and values that provide information about an implementation's floating-point arithmetic.

The following parameters are used to define the model for each floating-point type:

s Sign (±1).

b Base or radix of exponent representation (an integer >1).

e Exponent (an integer between a minimum $e_{\min}$ and a maximum $e_{\max}$).

p Precision (the number of base–*b* digits in the significand).

f_k Non-negative integers less than *b* (the significand digits).

A normalized floating-point number *x* (f_1 >0 if $x \neq 0$) is defined by the following model:

$$x = s \times b^e \times \sum_{k=1}^{p} f_k \times b^{-k},\ e_{\min} \le e \le e_{\max}$$

FLT_RADIX is a constant expression suitable for use in the **#if** preprocessing directives. All constants except FLT_RADIX and FLT_ROUNDS have separate names for all three floating-point types. The floating-point model representation is provided for all macro names except FLT_ROUNDS.

The rounding mode for floating-point addition is characterized by the value of FLT_ROUNDS:

–1 Indeterminable.

0 Toward 0.0.

1 To nearest.

2 Toward positive infinity.

3 Toward negative infinity.

All other values for FLT_ROUNDS characterize implementation-defined rounding behavior.

The values of operations with floating operands and values subject to the usual arithmetic conversions and of floating constants are evaluated to a format whose range and precision may be greater than required by the type. The use of evaluation formats is characterized by the implementation-defined value of FLT_EVAL_METHOD:

–1 Indeterminable.

0 Evaluate all operations and constants just to the range and precision of the type.

1 Evaluate operations and constants of type **float** and **double** to the range and precision of the **double** type, evaluate **long double** operations and constants to the range and precision of the **long double** type.

8530 2 Evaluate all operations and constants to the range and precision of the **long double** type.

8531 All other negative values for FLT_EVAL_METHOD characterize implementation-defined
8532 behavior.

8533 The macro names given in the following list are defined as expressions with values that are
8534 equal or greater in magnitude (absolute value) to those shown, with the same sign.

Name	Description	Value
FLT_RADIX	Radix of exponent representation, *b*.	2
FLT_MANT_DIG	Number of base-FLT_RADIX digits in the floating-point significand, *p*.	†
DBL_MANT_DIG	†	
LDBL_MANT_DIG	†	
	Number of decimal digits, *n*, such that any floating-point number in the widest supported floating type with *pmax* radix *b* digits can be rounded to a floating-point number with *n* decimal digits and back again without change to the value. ***Notes to Reviewers*** *This section with side shading will not appear in the final copy. - Ed.* D3, XSH, ERN 146 requires a new equation to be inserted here. However, none of the equations in float.h match the C99 style. This needs looking at again.	
DECIMAL_DIG		10
FLT_DIG	Number of decimal digits, *q*, such that any floating-point number with *q* decimal digits can be rounded into a floating-point number with *p* radix *b* digits and back again without change to the *q* decimal digits, $\lfloor (p-1) \times \log_{10} b \rfloor + \begin{cases} 1 & \text{if } b \text{ is a power of } 10 \\ 0 & \text{otherwise} \end{cases}$	6
DBL_DIG		10
LDBL_DIG		10
FLT_MIN_EXP	Minimum negative integer such that FLT_RADIX raised to that power minus 1 is a normalized floating-point number, $e_{\min}$	†
DBL_MIN_EXP	†	
LDBL_MIN_EXP	†	
FLT_MIN_10_EXP	Minimum negative integer such that 10 raised to that power is in the range of normalized floating-point numbers, $\lceil \log_{10} b^{e_{\min}-1} \rceil$	–37
DBL_MIN_10_EXP		–37
LDBL_MIN_10_EXP		–37
FLT_MAX_EXP	Maximum integer such that FLT_RADIX raised to that power minus 1 is a representable finite floating-point number, $e_{\max}$	†
DBL_MAX_EXP	†	
LDBL_MAX_EXP	†	

FLT_MAX_10_EXP	Maximum integer such that 10 raised to that power is in the range of representable finite floating-point numbers, $\lfloor \log_{10}((1-b^{-p}) \times b^{e_{max}}) \rfloor$	37
DBL_MAX_10_EXP		37
LDBL_MAX_10_EXP		37

† Implementation-defined values.

The macro names given in the following list are defined as expressions with values that are equal to or greater than those shown.

FLT_MAX	Maximum representable finite floating-point number, $(1-b^{-p}) \times b^{e_{max}}$	1E+37
DBL_MAX		1E+37
LDBL_MAX		1E+37

The macro names given in the following list are defined as expressions with values that are equal to or less than those shown.

FLT_EPSILON	The difference between 1.0 and the least value greater that 1.0 that is representable in the given floating-point type, $b^{(1-p)}$	1E–5
DBL_EPSILON		1E–9
LDBL_EPSILON		1E–9
FLT_MIN	Minimum normalized positive floating-point number, $b^{(e_{min}-1)}$	1E–37
DBL_MIN		1E–37
LDBL_MIN		1E–37

First released in Issue 4. Derived from the ISO C standard.

Issue 6

The description of the operations with floating-point values is updated for alignment with the ISO / IEC 9899: 1999 standard.

NAME

fmtmsg.h — message display structures

SYNOPSIS

XSI
```
#include <fmtmsg.h>
```

DESCRIPTION

The **<fmtmsg.h>** header shall define the following macros, which expand to constant integral expressions:

MM_HARD	Source of the condition is hardware.
MM_SOFT	Source of the condition is software.
MM_FIRM	Source of the condition is firmware.
MM_APPL	Condition detected by application.
MM_UTIL	Condition detected by utility.
MM_OPSYS	Condition detected by operating system.
MM_RECOVER	Recoverable error.
MM_NRECOV	Non-recoverable error.
MM_HALT	Error causing application to halt.
MM_ERROR	Application has encountered a non-fatal fault.
MM_WARNING	Application has detected unusual non-error condition.
MM_INFO	Informative message.
MM_NOSEV	No severity level provided for the message.
MM_PRINT	Display message on standard error.
MM_CONSOLE	Display message on system console.

The table below indicates the null values and identifiers for *fmtmsg*( ) arguments. The **<fmtmsg.h>** header shall define the macros in the **Identifier** column, which expand to constant expressions that expand to expressions of the type indicated in the **Type** column:

Argument	Type	Null-Value	Identifier
label	**char ***	(**char***)0	MM_NULLLBL
severity	**int**	0	MM_NULLSEV
class	**long**	**0L**	MM_NULLMC
text	**char ***	(**char***)0	MM_NULLTXT
action	**char ***	(**char***)0	MM_NULLACT
tag	**char ***	(**char***)0	MM_NULLTAG

The **<fmtmsg.h>** header shall also define the following macros for use as return values for *fmtmsg*( ):

MM_OK	The function succeeded.
MM_NOTOK	The function failed completely.
MM_NOMSG	The function was unable to generate a message on standard error, but otherwise succeeded.

8596 MM_NOCON The function was unable to generate a console message, but otherwise
8597 succeeded.

8598 The following shall be declared as a function and may also be defined as a macro. A function
8599 prototype shall be provided for use with an ISO C standard compiler.

8600 ```
int fmtmsg(long, const char *, int,
8601   const char *, const char *, const char *);
```

8612 **NAME**

8613 fnmatch.h — file name-matching types

8614 **SYNOPSIS**

8615 `#include <fnmatch.h>`

8616 **DESCRIPTION**

8617 The **<fnmatch.h>** header shall define the flags and return value used by the *fnmatch*( ) function.
8618 The following constants are defined:

8619 FNM_NOMATCH The string does not match the specified pattern.

8620 FNM_PATHNAME Slash in *string* only matches slash in *pattern*.

8621 FNM_PERIOD Leading period in *string* must be exactly matched by period in *pattern*.

8622 FNM_NOESCAPE Disable backslash escaping.

8623 FNM_NOSYS The implementation does not support this function. (**LEGACY**) |

8624 The following shall be declared as a function and may also be declared as a macro. Function
8625 prototypes shall be provided for use with an ISO C standard compiler.

8640 **NAME**

8641 ftw.h — file tree traversal

8642 **SYNOPSIS**

8643 XSI
```
#include <ftw.h>
```
8644

8645 **DESCRIPTION**

8646 The **<ftw.h>** header shall define the **FTW** structure that includes at least the following members:

8647
```
int  base
```
8648
```
int  level
```

8649 The **<ftw.h>** header shall define macros for use as values of the third argument to the
8650 application-supplied function that is passed as the second argument to *ftw*( ) and *nftw*( ):

8651 FTW_F File.

8652 FTW_D Directory.

8653 FTW_DNR Directory without read permission.

8654 FTW_DP Directory with subdirectories visited.

8655 FTW_NS Unknown type; *stat*( ) failed.

8656 FTW_SL Symbolic link.

8657 FTW_SLN Symbolic link that names a nonexistent file.

8658 The **<ftw.h>** header shall define macros for use as values of the fourth argument to *nftw*( ):

8659 FTW_PHYS Physical walk, does not follow symbolic links. Otherwise, *nftw*( ) follows
8660 links but does not walk down any path that crosses itself.

8661 FTW_MOUNT The walk does not cross a mount point.

8662 FTW_DEPTH All subdirectories are visited before the directory itself.

8663 FTW_CHDIR The walk changes to each directory before reading it.

8664 The following shall be declared as functions and may also be defined as macros. Function
8665 prototypes shall be provided for use with an ISO C standard compiler.

8666
```
int ftw(const char *,
    int (*)(const char *, const struct stat *, int), int);
int nftw(const char *, int (*)
    (const char *, const struct stat *, int, struct FTW*),
    int, int);
```

8671 The **<ftw.h>** header shall define the **stat** structure and the symbolic names for *st_mode* and the
8672 file type test macros as described in **<sys/stat.h>**.

8673 Inclusion of the **<ftw.h>** header may also make visible all symbols from **<sys/stat.h>**.

8674 **APPLICATION USAGE**

8675 None.

8676 **RATIONALE**

8677 None.

8678 **FUTURE DIRECTIONS**

8679 None.

8680 **SEE ALSO**

8681 **<sys/stat.h>**, the System Interfaces volume of IEEE Std. 1003.1-200x, *ftw*( ), *nftw*( )

8682 **CHANGE HISTORY**

8683 First released in Issue 1. Derived from Issue 1 of the SVID.

8684 **Issue 4**

8685 The function declarations in this header are expanded to full ISO C standard prototypes.

8686 A reference to **<sys/stat.h>** is added for the definition of the **stat** structure, the symbolic names
8687 for *st_mode*, and the file type test macros.

8688 A warning is added indicating that inclusion of **<ftw.h>** may also make visible all symbols from
8689 **<sys/stat.h>**.

8690 **Issue 4, Version 2**

8691 The following changes are incorporated in the DESCRIPTION for X/OPEN UNIX conformance:

8692 - The **FTW** structure is defined.

8693 - The *nftw*( ) function is declared by the header and is mentioned as one of the functions to
8694 which the first list of macros applies.

8695 - FTW_SL and FTW_SLN are added to the first list of macros to handle symbolic links.

8696 - Macros for use as values of the fourth argument to *nftw*( ) are defined.

8697 **Issue 5**

8698 A description of FTW_DP is added.

NAME

glob.h — path name pattern-matching types

SYNOPSIS

```
#include <glob.h>
```

DESCRIPTION

The **<glob.h>** header shall define the structures and symbolic constants used by the *glob*( ) function.

The structure type **glob_t** shall contain at least the following members:

```
size_t   gl_pathc  Count of paths matched by pattern.
char   **gl_pathv  Pointer to a list of matched path names.
size_t   gl_offs   Slots to reserve at the beginning of gl_pathv.
```

The following constants shall be provided as values for the *flags* argument:

GLOB_APPEND	Append generated path names to those previously obtained.
GLOB_DOOFFS	Specify how many null pointers to add to the beginning of *pglob->gl_pathv*.
GLOB_ERR	Cause *glob*( ) to return on error.
GLOB_MARK	Each path name that is a directory that matches *pattern* has a slash appended.
GLOB_NOCHECK	If *pattern* does not match any path name, then return a list consisting of only *pattern*.
GLOB_NOESCAPE	Disable backslash escaping.
GLOB_NOSORT	Do not sort the path names returned.

The following constants shall be defined as error return values:

GLOB_ABORTED	The scan was stopped because GLOB_ERR was set or (**errfunc*)( ) returned non-zero.
GLOB_NOMATCH	The pattern does not match any existing path name, and GLOB_NOCHECK was not set in flags.
GLOB_NOSPACE	An attempt to allocate memory failed.
GLOB_NOSYS	The implementation does not support this function.

The following shall be declared as functions and may also be declared as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
int  glob(const char *restrict, int, int (*restrict)(const char *, int),
         glob_t *restrict);
void globfree (glob_t *);
```

The implementation may define additional macros or constants using names beginning with GLOB_.

NAME

grp.h — group structure

SYNOPSIS

```
#include <grp.h>
```

DESCRIPTION

The **<grp.h>** header shall declare the structure **group** which shall include the following members:

`char *gr_name`	The name of the group.
`gid_t gr_gid`	Numerical group ID.
`char **gr_mem`	Pointer to a null-terminated array of character pointers to member names.

The **gid_t** type shall be defined as described in **<sys/types.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
struct group  *getgrgid(gid_t);
struct group  *getgrnam(const char *);
TSF int            getgrgid_r(gid_t, struct group *, char *,
                       size_t, struct group **);
int            getgrnam_r(const char *, struct group *, char *,
                       size_t , struct group **);
XSI struct group  *getgrent(void);
void           endgrent(void);
void           setgrent(void);
```

CHANGE HISTORY

First released in Issue 1.

Issue 4

A reference to **<sys/types.h>** is added for the definition of **gid_t** and marked as an extension.

The following change is incorporated for alignment with the ISO POSIX-1 standard:

- The function declarations in this header are expanded to full ISO C standard prototypes.

Issue 4, Version 2

For X/OPEN UNIX conformance, the *getgrent*( ), *endgrent*( ), and *setgrent*( ) functions are added to the list of functions declared in this header.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The definition of **gid_t** is mandated.
- The *getgrgid_r*( ) and *getgrnam_r*( ) functions are marked as part of the Thread-Safe Functions option.

NAME

iconv.h — codeset conversion facility

SYNOPSIS

XSI
```
#include <iconv.h>
```

DESCRIPTION

The **<iconv.h>** header shall define the following data type through **typedef**:

iconv_t Identifies the conversion from one codeset to another.

The following shall be declared as functions and may also be declared as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
iconv_t iconv_open(const char *, const char *);
size_t  iconv(iconv_t, char **restrict, size_t *restrict, char **restrict,
            size_t *restrict);
int     iconv_close(iconv_t);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The System Interfaces volume of IEEE Std. 1003.1-200x, *iconv*( ), *iconv_close*( ), *iconv_open*( )

CHANGE HISTORY

First released in Issue 4.

Issue 6

The **restrict** keyword is added to the prototype for *iconv*( ).

8824 **NAME**

8825 inttypes.h — fixed size integer types

8826 **SYNOPSIS**

8827 XSI
```
#include <inttypes.h>
```
8828

8829 **DESCRIPTION**

8830 The **<inttypes.h>** header shall include the **<stdint.h>** header.

8831 ***Notes to Reviewers***

8832 *This section with side shading will not appear in the final copy. - Ed.*

8833 Reviewers are asked to propose changes to eliminate duplication between inttypes.h and
8834 stdin.h.

8835 The **<inttypes.h>** header shall include definitions of at least the following types:

8836 **imaxdiv_t** Structure type that is the type of the value returned by the *imaxdiv*( ) function.

8837 **int8_t** 8-bit signed integer type.

8838 **int16_t** 16-bit signed integer type.

8839 **int32_t** 32-bit signed integer type.

8840 **uint8_t** 8-bit unsigned integer type.

8841 **uint16_t** 16-bit unsigned integer type.

8842 **uint32_t** 32-bit unsigned integer type.

8843 **intptr_t** Signed integer type large enough to hold any pointer.

8844 **uintptr_t** Unsigned integer type large enough to hold any pointer.

8845 If any of the following are true:

8846 8847 8848 8849
- The implementation supports the _POSIX_V6_ILP32_OFFBIG programming environment and the application is being built in the _POSIX_V6_ILP32_OFFBIG programming environment (see the Shell and Utilities volume of IEEE Std. 1003.1-200x, *c99*, Programming Environments).

8850 8851
- The implementation supports the _POSIX_V6_LP64_OFF64 programming environment and the application is being built in the _POSIX_V6_LP64_OFF64 programming environment.

8852 8853 8854
- The implementation supports the _POSIX_V6_LPBIG_OFFBIG programming environment and the application is being built in the _POSIX_V6_LPBIG_OFFBIG programming environment.

8855 then **<inttypes.h>** also shall include definitions for the following types:

8856 **int64_t** 64-bit signed integer type.

8857 **uint64_t** 64-bit unsigned integer type.

8858 8859 8860 8861 8862 8863 If __STDC_FORMAT_MACROS is defined before **<inttypes.h>** is included, then the following object-like macros shall be defined. Each expands to a character string literal containing a conversion specifier, possibly modified by a length modifier, suitable for use within the *format* argument of a formatted input/output function when converting the corresponding integer type. These macro names have the general form of PRI (character string literals for the *fprintf*( ) and *fwprintf*( ) family of functions) or SCN (character string literals for the *fscanf*( ) and *fwscanf*( )

family of functions), followed by the conversion specifier, followed by a name corresponding to a similar type name in **<stdint.h>**. In these names, N represents the width of the type as described in *stdint.h*( ). For example, *PRIdFAST32* can be used in a format string to print the value of an integer of type **int_fast32_t**.

The *fprintf*( ) macros for signed integers are:

PRIdN	PRIdLEASTN	PRIdFASTN	PRIdMAX	PRIdPTR
PRIiN	PRIiLEASTN	PRIiFASTN	PRIiMAX	PRIiPTR

The *fprintf*( ) macros for unsigned integers are:

PRIoN	PRIoLEASTN	PRIoFASTN	PRIoMAX	PRIoPTR
PRIuN	PRIuLEASTN	PRIuFASTN	PRIuMAX	PRIuPTR
PRIxN	PRIxLEASTN	PRIxFASTN	PRIxMAX	PRIxPTR
PRIXN	PRIXLEASTN	PRIXFASTN	PRIXMAX	PRIXPTR

The *fscanf*( ) macros for signed integers are:

SCNdN	SCNdLEASTN	SCNdFASTN	SCNdMAX	SCNdPTR
SCNiN	SCNiLEASTN	SCNiFASTN	SCNiMAX	SCNiPTR

The *fscanf*( ) macros for unsigned integers are:

SCNoN	SCNoLEASTN	SCNoFASTN	SCNoMAX	SCNoPTR
SCNuN	SCNuLEASTN	SCNuFASTN	SCNuMAX	SCNuPTR
SCNxN	SCNxLEASTN	SCNxFASTN	SCNxMAX	SCNxPTR

For each type that the implementation provides in **<stdint.h>**, the corresponding *fprintf*( ) macros shall be defined and the corresponding *fscanf*( ) macros shall be defined unless the implementation does not have a suitable fscanf length modifier for the type.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
intmax_t  imaxabs(intmax_t);
imaxdiv_t imaxdiv(intmax_t, intmax_t);
intmax_t  strtoimax(const char *restrict, char **restrict, int);
uintmax_t strtoumax(const char *restrict, char **restrict, int);
intmax_t  wcstoimax(const wchar_t *restrict, wchar_t **restrict, int);
uintmax_t wcstoumax(const wchar_t *restrict, wchar_t **restrict, int);
```

EXAMPLES

```
#include <inttypes.h>
#include <wchar.h>
int main(void)
{
    uintmax_t i = UINTMAX_MAX; // This type always exists.
    wprintf(L"The largest integer value is %020"
        PRIxMAX "\n", i);
    return 0;
}
```

APPLICATION USAGE

None.

RATIONALE

The **<inttypes.h>** header was derived from the header of the same name found on several existing 64-bit systems. The C Standard Committee debated other methods for specifying integer sizes and other characteristics, but in the end decided to standardize existing practice rather than innovate in this area.

The ISO/IEC 9899:1990 standard specifies that the language should support four signed and unsigned integer data types—**char**, **short**, **int**, and **long**—but places very little requirement on their size other than that **int** and **short** be at least 16 bits and **long** be at least as long as **int** and not smaller than 32 bits. For 16-bit systems, most implementations assign 8, 16, 16, and 32 bits to **char**, **short**, **int**, and **long**, respectively. For 32-bit systems, the common practice is to assign 8, 16, 32, and 32 bits to these types. This difference in **int** size can create some problems for users who migrate from one system to another which assigns different sizes to integer types, because the ISO C standard integer promotion rule can produce silent changes unexpectedly. The need for defining an extended integer type increased with the introduction of 64-bit systems.

The purpose of **<inttypes.h>** is to provide a set of integer types whose definitions are consistent across machines and independent of operating systems and other implementation idiosyncrasies. It defines, via **typedef**, integer types of various sizes. Implementations are free to **typedef** them as ISO C standard integer types or extensions that they support. Consistent use of this header will greatly increase the portability of a users program across platforms.

FUTURE DIRECTIONS

Macro names beginning with PRI or SCN followed by any lowercase letter or `'X'` may be added to the macros defined in the **<inttypes.h>** header.

CHANGE HISTORY

First released in Issue 5.

Issue 6

The Open Group Base Resolution bwg97-006 is applied.

This reference page is updated to align with the ISO/IEC 9899:1999 standard.

NAME

iso646.h — alternative spellings

SYNOPSIS

```
#include <iso646.h>
```

DESCRIPTION

CX The functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of symbols in this header.

The **<iso646.h>** header shall define the following eleven macros (on the left) that expand to the corresponding tokens (on the right):

and	&&
and_eq	&=
bitand	&
bitor	|
compl	~
not	!
not_eq	!=
or	||
or_eq	|=
xor	^
xor_eq	^=

NAME

langinfo.h — language information constants

SYNOPSIS

XSI

```
#include <langinfo.h>
```

DESCRIPTION

The **<langinfo.h>** header contains the constants used to identify items of *langinfo* data (see *nl_langinfo*( )). The type of the constant, **nl_item**, shall be defined as described in **<nl_types.h>**.

The following constants shall be defined. The entries under **Category** indicate in which *setlocale*( ) category each item is defined.

Constant	Category	Meaning
CODESET	*LC_CTYPE*	Codeset name.
D_T_FMT	*LC_TIME*	String for formatting date and time.
D_FMT	*LC_TIME*	Date format string.
T_FMT	*LC_TIME*	Time format string.
T_FMT_AMPM	*LC_TIME*	a.m. or p.m. time format string.
AM_STR	*LC_TIME*	Ante Meridian affix.
PM_STR	*LC_TIME*	Post Meridian affix.
DAY_1	*LC_TIME*	Name of the first day of the week (for example, Sunday).
DAY_2	*LC_TIME*	Name of the second day of the week (for example, Monday).
DAY_3	*LC_TIME*	Name of the third day of the week (for example, Tuesday).
DAY_4	*LC_TIME*	Name of the fourth day of the week (for example, Wednesday).
DAY_5	*LC_TIME*	Name of the fifth day of the week (for example, Thursday).
DAY_6	*LC_TIME*	Name of the sixth day of the week (for example, Friday).
DAY_7	*LC_TIME*	Name of the seventh day of the week (for example, Saturday).
ABDAY_1	*LC_TIME*	Abbreviated name of the first day of the week.
ABDAY_2	*LC_TIME*	Abbreviated name of the second day of the week.
ABDAY_3	*LC_TIME*	Abbreviated name of the third day of the week.
ABDAY_4	*LC_TIME*	Abbreviated name of the fourth day of the week.
ABDAY_5	*LC_TIME*	Abbreviated name of the fifth day of the week.
ABDAY_6	*LC_TIME*	Abbreviated name of the sixth day of the week.
ABDAY_7	*LC_TIME*	Abbreviated name of the seventh day of the week.
MON_1	*LC_TIME*	Name of the first month of the year.
MON_2	*LC_TIME*	Name of the second month.
MON_3	*LC_TIME*	Name of the third month.
MON_4	*LC_TIME*	Name of the fourth month.
MON_5	*LC_TIME*	Name of the fifth month.
MON_6	*LC_TIME*	Name of the sixth month.
MON_7	*LC_TIME*	Name of the seventh month.
MON_8	*LC_TIME*	Name of the eighth month.
MON_9	*LC_TIME*	Name of the ninth month.
MON_10	*LC_TIME*	Name of the tenth month.
MON_11	*LC_TIME*	Name of the eleventh month.
MON_12	*LC_TIME*	Name of the twelfth month.

Constant	Category	Meaning
ABMON_1	*LC_TIME*	Abbreviated name of the first month.
ABMON_2	*LC_TIME*	Abbreviated name of the second month.
ABMON_3	*LC_TIME*	Abbreviated name of the third month.
ABMON_4	*LC_TIME*	Abbreviated name of the fourth month.
ABMON_5	*LC_TIME*	Abbreviated name of the fifth month.
ABMON_6	*LC_TIME*	Abbreviated name of the sixth month.
ABMON_7	*LC_TIME*	Abbreviated name of the seventh month.
ABMON_8	*LC_TIME*	Abbreviated name of the eighth month.
ABMON_9	*LC_TIME*	Abbreviated name of the ninth month.
ABMON_10	*LC_TIME*	Abbreviated name of the tenth month.
ABMON_11	*LC_TIME*	Abbreviated name of the eleventh month.
ABMON_12	*LC_TIME*	Abbreviated name of the twelfth month.
ERA	*LC_TIME*	Era description segments.
ERA_D_FMT	*LC_TIME*	Era date format string.
ERA_D_T_FMT	*LC_TIME*	Era date and time format string.
ERA_T_FMT	*LC_TIME*	Era time format string.
ALT_DIGITS	*LC_TIME*	Alternative symbols for digits.
RADIXCHAR	*LC_NUMERIC*	Radix character.
THOUSEP	*LC_NUMERIC*	Separator for thousands.
YESEXPR	*LC_MESSAGES*	Affirmative response expression.
NOEXPR	*LC_MESSAGES*	Negative response expression.
CRNCYSTR	*LC_MONETARY*	Currency symbol, preceded by '−' if the symbol should appear before the value, '+' if the symbol should appear after the value, or '.' if the symbol should replace the radix character.

If the locale's value for **p_cs_precedes** and **n_cs_precedes** does not match, the value of *nl_langinfo*(CRNCYSTR) is unspecified.

The following shall be declared as a function and may also be declared as a macro. Function prototypes shall be provided for use with an ISO C standard compiler.

```
char *nl_langinfo(nl_item);
```

Inclusion of the **<langinfo.h>** header may also make visible all symbols from **<nl_types.h>**.

APPLICATION USAGE

Wherever possible, users are advised to use functions compatible with those in the ISO C standard to access items of *langinfo* data. In particular, the *strftime*( ) function should be used to access date and time information defined in category *LC_TIME*. The *localeconv*( ) function should be used to access information corresponding to RADIXCHAR, THOUSEP, and CRNCYSTR.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The System Interfaces volume of IEEE Std. 1003.1-200x, *nl_langinfo*( ), *localeconv*( ), *strfmon*( ), *strftime*( ), Chapter 7 (on page 143)

CHANGE HISTORY

First released in Issue 2.

Issue 4

The function declarations in this header are expanded to full ISO C standard prototypes.

The constants CODESET, T_FMT_AMPM, ERA, ERA_D_FMT, ALT_DIGITS, YESEXPR, and NOEXPR are added.

The constants YESSTR and NOSTR are marked TO BE WITHDRAWN.

Reference to the Gregorian calendar is removed.

The constants YESSTR and NOSTR are now defined as belonging to category *LC_MESSAGES*. Previously they were defined as constants in category *LC_ALL*.

A warning is added indicating that inclusion of **<langinfo.h>** may also make visible all symbols from **<nl_types.h>**.

The APPLICATION USAGE section is expanded to recommend use of the *localeconv*( ) function.

Issue 5

The constants YESSTR and NOSTR are marked LEGACY.

Issue 6

The constants YESSTR and NOSTR are removed.

NAME

libgen.h — definitions for pattern matching functions

SYNOPSIS

XSI
```
#include <libgen.h>
```

DESCRIPTION

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
char  *basename(char *);
char  *dirname(char *);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The System Interfaces volume of IEEE Std. 1003.1-200x, *basename*( ), *dirname*( )

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

The function prototypes for *basename*( ) and *dirname*( ) are changed to indicate that the first argument is of type **char*** rather than **const char***.

NAME

limits.h — implementation-defined constants

SYNOPSIS

```
#include <limits.h>
```

DESCRIPTION

CX The functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of symbols in this header.

The **<limits.h>** header shall define various symbolic names. Different categories of names are described below.

The names represent various limits on resources that the implementation imposes on applications.

Implementations may choose any appropriate value for each limit, provided it is not more restrictive than the Minimum Acceptable Values listed below. Symbolic constant names beginning with _POSIX may be found in **<unistd.h>**.

Applications should not assume any particular value for a limit. To achieve maximum portability, an application should not require more resource than the Minimum Acceptable Value quantity. However, an application wishing to avail itself of the full amount of a resource available on an implementation may make use of the value given in **<limits.h>** on that particular implementation, by using the symbolic names listed below. It should be noted, however, that many of the listed limits are not invariant, and at runtime, the value of the limit may differ from those given in this header, for the following reasons:

- The limit is path name-dependent.
- The limit differs between the compile and runtime machines.

For these reasons, an application may use the *fpathconf*( ), *pathconf*( ), and *sysconf*( ) functions to determine the actual value of a limit at runtime.

The items in the list ending in _MIN give the most negative values that the mathematical types are guaranteed to be capable of representing. Numbers of a more negative value may be supported on some implementations, as indicated by the **<limits.h>** header on the implementation, but applications requiring such numbers are not guaranteed to be portable to all implementations. For positive constants ending in _MIN, this indicates the minimum acceptable value.

The Minimum Acceptable Value symbol `'*'` indicates that there is no guaranteed value across all conforming implementations.

Runtime Invariant Values (Possibly Indeterminate)

A definition of one of the symbolic names in the following list shall be omitted from **<limits.h>** on specific implementations where the corresponding value is equal to or greater than the stated minimum, but is indeterminate.

This indetermination might depend on the amount of available memory space on a specific instance of a specific implementation. The actual value supported by a specific instance shall be provided by the *sysconf*( ) function.

AIO {AIO_LISTIO_MAX}
Maximum number of I/O operations in a single list I/O call supported by the

implementation.
Minimum Acceptable Value: {_POSIX_AIO_LISTIO_MAX}

AIO {AIO_MAX}
Maximum number of outstanding asynchronous I/O operations supported by the implementation.
Minimum Acceptable Value: {_POSIX_AIO_MAX}

AIO {AIO_PRIO_DELTA_MAX}
The maximum amount by which a process can decrease its asynchronous I/O priority level from its own scheduling priority.
Minimum Acceptable Value: 0

{ARG_MAX}
Maximum length of argument to the *exec* functions including environment data.
Minimum Acceptable Value: {_POSIX_ARG_MAX}

XSI {ATEXIT_MAX}
Maximum number of functions that may be registered with *atexit*( ).
Minimum Acceptable Value: 32

{CHILD_MAX}
Maximum number of simultaneous processes per real user ID.
Minimum Acceptable Value: 25

TMR {DELAYTIMER_MAX}
Maximum number of timer expiration overruns.
Minimum Acceptable Value: {_POSIX_DELAYTIMER_MAX}

XSI {IOV_MAX}
Maximum number of **iovec** structures that one process has available for use with *readv*( ) or *writev*( ).
Minimum Acceptable Value: {_XOPEN_IOV_MAX}

{LOGIN_NAME_MAX}
Maximum length of a login name.
Minimum Acceptable Value: {_POSIX_LOGIN_NAME_MAX}

MSG {MQ_OPEN_MAX}
The maximum number of open message queue descriptors a process may hold.
Minimum Acceptable Value: {_POSIX_MQ_OPEN_MAX}

MSG {MQ_PRIO_MAX}
The maximum number of message priorities supported by the implementation.
Minimum Acceptable Value: {_POSIX_MQ_PRIO_MAX}

{OPEN_MAX}
Maximum number of files that one process can have open at any one time.
Minimum Acceptable Value: 20

{PAGESIZE}
Size in bytes of a page.
Minimum Acceptable Value: 1

XSI {PAGE_SIZE}
Same as {PAGESIZE}. If either {PAGESIZE} or {PAGE_SIZE} is defined, the other is defined with the same value.

THR {PTHREAD_DESTRUCTOR_ITERATIONS}
Maximum number of attempts made to destroy a thread's thread-specific data values on thread exit.
Minimum Acceptable Value: {_POSIX_THREAD_DESTRUCTOR_ITERATIONS}

THR {PTHREAD_KEYS_MAX}
Maximum number of data keys that can be created by a process.
Minimum Acceptable Value: {_POSIX_THREAD_KEYS_MAX}

THR {PTHREAD_STACK_MIN}
Minimum size in bytes of thread stack storage.
Minimum Acceptable Value: 0

THR {PTHREAD_THREADS_MAX}
Maximum number of threads that can be created per process.
Minimum Acceptable Value: {_POSIX_THREAD_THREADS_MAX}

{RE_DUP_MAX}
The number of repeated occurrences of a BRE permitted by the *regexec*( ) and *regcomp*( ) functions when using the interval notation {\(*m*,*n*\}; see Section 9.3.6 (on page 201).
Minimum Acceptable Value: {_POSIX2_RE_DUP_MAX}

RTS {RTSIG_MAX}
Maximum number of realtime signals reserved for application use in this implementation.
Minimum Acceptable Value: {_POSIX_RTSIG_MAX}

SEM {SEM_NSEMS_MAX}
Maximum number of semaphores that a process may have.
Minimum Acceptable Value: {_POSIX_SEM_NSEMS_MAX}

SEM {SEM_VALUE_MAX}
The maximum value a semaphore may have.
Minimum Acceptable Value: {_POSIX_SEM_VALUE_MAX}

RTS {SIGQUEUE_MAX}
Maximum number of queued signals that a process may send and have pending at the receiver(s) at any time.
Minimum Acceptable Value: {_POSIX_SIGQUEUE_MAX}

SS|TSP {SS_REPL_MAX}
The maximum number of replenishment operations that may be simultaneously pending for a particular sporadic server scheduler.
Minimum Acceptable Value: {_POSIX_SS_REPL_MAX}

{STREAM_MAX}
The number of streams that one process can have open at one time. If defined, it has the same value as {FOPEN_MAX} (see **<stdio.h>**).
Minimum Acceptable Value: {_POSIX_STREAM_MAX}

{SYMLOOP_MAX}
Maximum number of symbolic links that can be reliably traversed in the resolution of a path name in the absence of a loop.
Minimum Acceptable Value: {_POSIX_SYMLOOP_MAX}

TMR {TIMER_MAX}
Maximum number of timers per-process supported by the implementation.
Minimum Acceptable Value: {_POSIX_TIMER_MAX}

TRC {TRACE_EVENT_NAME_MAX}
Maximum length of the trace event name.
Minimum Acceptable Value: {_POSIX_TRACE_EVENT_NAME_MAX}

TRC {TRACE_NAME_MAX}
Maximum length of the trace generation version string or of the trace stream name.
Minimum Acceptable Value: {_POSIX_TRACE_NAME_MAX}

TRC {TRACE_SYS_MAX}
Maximum number of trace streams that may simultaneously exist in the system.
Minimum Acceptable Value: {_POSIX_TRACE_SYS_MAX}

TRC {TRACE_USER_EVENT_MAX}
Maximum number of user trace event type identifiers that may simultaneously exist in a traced process, including the predefined user trace event POSIX_TRACE_UNNAMED_USER_EVENT.
Minimum Acceptable Value: {_POSIX_TRACE_USER_EVENT_MAX}

{TTY_NAME_MAX}
Maximum length of terminal device name.
Minimum Acceptable Value: {_POSIX_TTY_NAME_MAX}

{TZNAME_MAX}
Maximum number of bytes supported for the name of a timezone (not of the TZ variable).
Minimum Acceptable Value: {_POSIX_TZNAME_MAX}

Note: The length given by {TZNAME_MAX} does not include the quoting characters mentioned in Section 8.3 (on page 192).

Path Name Variable Values

The values in the following list may be constants within an implementation or may vary from one path name to another. For example, file systems or directories may have different characteristics.

A definition of one of the values shall be omitted from the **<limits.h>** header on specific implementations where the corresponding value is equal to or greater than the stated minimum, but where the value can vary depending on the file to which it is applied. The actual value supported for a specific path name shall be provided by the *pathconf*( ) function.

{FILESIZEBITS}
Minimum number of bits needed to represent, as a signed integer value, the maximum size of a regular file allowed in the specified directory.
Minimum Acceptable Value: 32

{LINK_MAX}
Maximum number of links to a single file.
Minimum Acceptable Value: {_POSIX_LINK_MAX}

{MAX_CANON}
Maximum number of bytes in a terminal canonical input line.
Minimum Acceptable Value: {_POSIX_MAX_CANON}

{MAX_INPUT}
Minimum number of bytes for which space is available in a terminal input queue; therefore, the maximum number of bytes a portable application may require to be typed as input before reading them.
Minimum Acceptable Value: {_POSIX_MAX_INPUT}

{NAME_MAX}
Maximum number of bytes in a file name (not including terminating null).
Minimum Acceptable Value: {_POSIX_NAME_MAX}

{PATH_MAX}
Maximum number of bytes in a path name, including the terminating null character.
Minimum Acceptable Value: {_POSIX_PATH_MAX}

{PIPE_BUF}
Maximum number of bytes that is guaranteed to be atomic when writing to a pipe.
Minimum Acceptable Value: {_POSIX_PIPE_BUF}

ADV {POSIX_ALLOC_SIZE_MIN}
Minimum number of bytes of storage actually allocated for any portion of a file.
Minimum Acceptable Value: Not specified.

ADV {POSIX_REC_INCR_XFER_SIZE}
Recommended increment for file transfer sizes between the {POSIX_REC_MIN_XFER_SIZE} and {POSIX_REC_MAX_XFER_SIZE} values.
Minimum Acceptable Value: Not specified.

ADV {POSIX_REC_MAX_XFER_SIZE}
Maximum recommended file transfer size.
Minimum Acceptable Value: Not specified.

ADV {POSIX_REC_MIN_XFER_SIZE}
Minimum recommended file transfer size.
Minimum Acceptable Value: Not specified.

ADV {POSIX_REC_XFER_ALIGN}
Recommended file transfer buffer alignment.
Minimum Acceptable Value: Not specified.

{SYMLINK_MAX}
Maximum number of bytes in a symbolic link.
Minimum Acceptable Value: {_POSIX_SYMLINK_MAX}

Runtime Increasable Values

The magnitude limitations in the following list shall be fixed by specific implementations. An application should assume that the value supplied by **<limits.h>** in a specific implementation is the minimum that pertains whenever the application is run under that implementation. A specific instance of a specific implementation may increase the value relative to that supplied by **<limits.h>** for that implementation. The actual value supported by a specific instance shall be provided by the *sysconf*( ) function.

{BC_BASE_MAX}
Maximum *obase* values allowed by the *bc* utility.
Minimum Acceptable Value: {_POSIX2_BC_BASE_MAX}

{BC_DIM_MAX}
Maximum number of elements permitted in an array by the *bc* utility.
Minimum Acceptable Value: {_POSIX2_BC_DIM_MAX}

{BC_SCALE_MAX}
Maximum *scale* value allowed by the *bc* utility.
Minimum Acceptable Value: {_POSIX2_BC_SCALE_MAX}

{BC_STRING_MAX}
Maximum length of a string constant accepted by the *bc* utility.
Minimum Acceptable Value: {_POSIX2_BC_STRING_MAX}

{CHARCLASS_NAME_MAX}
Maximum number of bytes in a character class name.
Minimum Acceptable Value: {_POSIX2_CHARCLASS_NAME_MAX}

{COLL_WEIGHTS_MAX}
Maximum number of weights that can be assigned to an entry of the *LC_COLLATE* **order** keyword in the locale definition file; see Chapter 7 (on page 143).
Minimum Acceptable Value: {_POSIX2_COLL_WEIGHTS_MAX}

{EXPR_NEST_MAX}
Maximum number of expressions that can be nested within parentheses by the *expr* utility.
Minimum Acceptable Value: {_POSIX2_EXPR_NEST_MAX}

{LINE_MAX}
Unless otherwise noted, the maximum length, in bytes, of a utility's input line (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing newline.
Minimum Acceptable Value: {_POSIX2_LINE_MAX}

{NGROUPS_MAX}
Maximum number of simultaneous supplementary group IDs per process.
Minimum Acceptable Value: 8

{RE_DUP_MAX}
Maximum number of repeated occurrences of a regular expression permitted when using the interval notation \{*m*,*n*\}; see Chapter 9 (on page 195).
Minimum Acceptable Value: {_POSIX2_RE_DUP_MAX}

Maximum Values

TMR The symbolic constants in the following list shall be defined in **<limits.h>** with the values shown. These are symbolic names for the most restrictive value for certain features on an implementation supporting the Timers option. A conforming implementation shall provide values no larger than these values. A portable application must not require a smaller value for correct operation.

TMR {_POSIX_CLOCKRES_MIN}
The resolution of the CLOCK_REALTIME clock, in nanoseconds.
Value: 20 000 000

MON If the Monotonic Clock option is supported, the resolution of the CLOCK_MONOTONIC clock, in nanoseconds, is represented by {_POSIX_CLOCKRES_MIN}.

Minimum Values

The symbolic constants in the following list shall be defined in **<limits.h>** with the values shown. These are symbolic names for the most restrictive value for certain features on an implementation conforming to this volume of IEEE Std. 1003.1-200x. Related symbolic constants are defined elsewhere in this volume of IEEE Std. 1003.1-200x which reflect the actual implementation and which need not be as restrictive. A conforming implementation shall provide values at least this large. A strictly conforming application must not require a larger value for correct operation.

AIO {_POSIX_AIO_LISTIO_MAX}
The number of I/O operations that can be specified in a list I/O call.
Value: 2

AIO {_POSIX_AIO_MAX}
The number of outstanding asynchronous I/O operations.
Value: 1

{_POSIX_ARG_MAX}
Maximum length of argument to the *exec* functions including environment data.
Value: 4 096

{_POSIX_CHILD_MAX}
Maximum number of simultaneous processes per real user ID.
Value: 6

TMR {_POSIX_DELAYTIMER_MAX}
The number of timer expiration overruns.
Value: 32

{_POSIX_LINK_MAX}
Maximum number of links to a single file.
Value: 8

{_POSIX_LOGIN_NAME_MAX}
The size of the storage required for a login name, in bytes, including the terminating null.
Value: 9

{_POSIX_MAX_CANON}
Maximum number of bytes in a terminal canonical input queue.
Value: 255

{_POSIX_MAX_INPUT}
Maximum number of bytes allowed in a terminal input queue.
Value: 255

MSG {_POSIX_MQ_OPEN_MAX}
The number of message queues that can be open for a single process.
Value: 8

MSG {_POSIX_MQ_PRIO_MAX}
The maximum number of message priorities supported by the implementation.
Value: 32

Notes to Reviewers

This section with side shading will not appear in the final copy. - Ed.

D1, XSH, ERN 436 proposes increasing the value of {_POSIX_NAME_MAX} to 256. Similarly, it proposes {_POSIX_PATH_MAX} be 1 024.

{_POSIX_NAME_MAX}
Maximum number of bytes in a file name (not including terminating null).
Value: 14

Notes to Reviewers

This section with side shading will not appear in the final copy. - Ed.

D1, XSH, ERN 19 proposes to increase {_POSIX_NGROUPS_MAX}, {_POSIX_OPEN_MAX}, and {_POSIX_CHILD_MAX} to their FIPS values (8, 20, 25) as with the limits equivalents without the leading _POSIX).

{_POSIX_NGROUPS_MAX}
Maximum number of simultaneous supplementary group IDs per process.
Value: 0

{_POSIX_OPEN_MAX}
Maximum number of files that one process can have open at any one time.
Value: 16

{_POSIX_PATH_MAX}
Maximum number of bytes in a path name.
Value: 256

{_POSIX_PIPE_BUF}
Maximum number of bytes that is guaranteed to be atomic when writing to a pipe.
Value: 512

{_POSIX_RE_DUP_MAX}
The number of repeated occurrences of a BRE permitted by the *regexec*( ) and *regcomp*( ) functions when using the interval notation {\(*m*,*n*\}; see Section 9.3.6 (on page 201).
Value: 255

RTS {_POSIX_RTSIG_MAX}
The number of realtime signal numbers reserved for application use.
Value: 8

SEM {_POSIX_SEM_NSEMS_MAX}
The number of semaphores that a process may have.
Value: 256

SEM {_POSIX_SEM_VALUE_MAX}
The maximum value a semaphore may have.
Value: 32 767

RTS {_POSIX_SIGQUEUE_MAX}
The number of queued signals that a process may send and have pending at the receiver(s) at any time.
Value: 32

{_POSIX_SSIZE_MAX}
The value that can be stored in an object of type **ssize_t**.
Value: 32 767

{_POSIX_STREAM_MAX}
The number of streams that one process can have open at one time.
Value: 8

SS|TSP {_POSIX_SS_REPL_MAX}
The number of replenishment operations that may be simultaneously pending for a particular sporadic server scheduler.
Value: 4

{_POSIX_SYMLINK_MAX}
The number of bytes in a symbolic link.
Value: 255

{_POSIX_SYMLOOP_MAX}
The number of symbolic links that can be traversed in the resolution of a path name in the absence of a loop.
Value: 8

THR {_POSIX_THREAD_DESTRUCTOR_ITERATIONS}
The number of attempts made to destroy a thread's thread-specific data values on thread exit.
Value: 4

THR {_POSIX_THREAD_KEYS_MAX}
The number of data keys per process.
Value: 128

THR {_POSIX_THREAD_THREADS_MAX}
The number of threads per process.
Value: 64

TMR {_POSIX_TIMER_MAX}
The per process number of timers.
Value: 32

TRC {_POSIX_TRACE_EVENT_NAME_MAX}
The length in bytes of a trace event name.
Value: 30

TRC {_POSIX_TRACE_NAME_MAX}
The length in bytes of a trace generation version string or a trace stream name.
Value: 8

TRC {_POSIX_TRACE_SYS_MAX}
The number of trace streams that may simultaneously exist in the system.
Value: 8

TRC {_POSIX_TRACE_USER_EVENT_MAX}
The number of user trace event type identifiers that may simultaneously exist in a traced process, including the predefined user trace event POSIX_TRACE_UNNAMED_USER_EVENT.
Value: 32

{_POSIX_TTY_NAME_MAX}
The size of the storage required for a terminal device name, in bytes, including the terminating null.
Value: 9

{_POSIX_TZNAME_MAX}
Maximum number of bytes supported for the name of a timezone (not of the TZ variable).
Value: 6

Note: The length given by {_POSIX_TZNAME_MAX} does not include the quoting characters mentioned in Section 8.3 (on page 192).

{_POSIX2_BC_BASE_MAX}
Maximum *obase* values allowed by the *bc* utility.
Value: 99

{_POSIX2_BC_DIM_MAX}
Maximum number of elements permitted in an array by the *bc* utility.
Value: 2 048

{_POSIX2_BC_SCALE_MAX}
Maximum *scale* value allowed by the *bc* utility.
Value: 99

{_POSIX2_BC_STRING_MAX}
Maximum length of a string constant accepted by the *bc* utility.
Value: 1 000

{_POSIX2_CHARCLASS_NAME_MAX}
Maximum number of bytes in a character class name.
Value: 14

{_POSIX2_COLL_WEIGHTS_MAX}
Maximum number of weights that can be assigned to an entry of the *LC_COLLATE* **order** keyword in the locale definition file; see Chapter 7 (on page 143).
Value: 2

{_POSIX2_EXPR_NEST_MAX}
Maximum number of expressions that can be nested within parentheses by the *expr* utility.
Value: 32

{_POSIX2_LINE_MAX}
Unless otherwise noted, the maximum length, in bytes, of a utility's input line (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing newline.
Value: 2 048

{_POSIX2_RE_DUP_MAX]
Maximum number of repeated occurrences of a regular expression permitted when using the interval notation \{*m*,*n*\}; see Chapter 9 (on page 195).
Value: 255

XSI {_XOPEN_IOV_MAX}
Maximum number of **iovec** structures that one process has available for use with *readv*( ) or *writev*( ).
Value: 16

Numerical Limits

The values in the following lists shall be defined in **<limits.h>** and are constant expressions XSI suitable for use in **#if** preprocessing directives. Moreover, except for {CHAR_BIT}, {DBL_DIG}, {DBL_MAX}, {FLT_DIG}, {FLT_MAX}, {LONG_BIT}, {WORD_BIT}, and {MB_LEN_MAX}, the symbolic names are defined as expressions of the correct type.

If the value of an object of type **char** is treated as a signed integer when used in an expression, the value of {CHAR_MIN} is the same as that of {SCHAR_MIN} and the value of {CHAR_MAX} is the same as that of {SCHAR_MAX}. Otherwise, the value of {CHAR_MIN} is 0 and the value of {CHAR_MAX} is the same as that of {UCHAR_MAX}.

{CHAR_BIT}
Number of bits in a type **char**.
Minimum Acceptable Value: 8

{CHAR_MAX}
Maximum value of type **char**.
Minimum Acceptable Value: {UCHAR_MAX} or {SCHAR_MAX}

{INT_MAX}
Maximum value of an **int**.
Minimum Acceptable Value: 2 147 483 647

XSI {LONG_BIT}
Number of bits in a **long**.
Minimum Acceptable Value: 32

{LONG_MAX}
Maximum value of a **long**.
Minimum Acceptable Value: +2 147 483 647

{MB_LEN_MAX}
Maximum number of bytes in a character, for any supported locale.
Minimum Acceptable Value: 1

{SCHAR_MAX}
Maximum value of type **signed char**.
Minimum Acceptable Value: +127

{SHRT_MAX}
Maximum value of type **short**.
Minimum Acceptable Value: +32 767

{SSIZE_MAX}
Maximum value of an object of type **ssize_t**.
Minimum Acceptable Value: {_POSIX_SSIZE_MAX}

{UCHAR_MAX}
Maximum value of type **unsigned char**.
Minimum Acceptable Value: 255

{UINT_MAX}
Maximum value of type **unsigned**.
Minimum Acceptable Value: 4 294 967 295

{ULONG_MAX}
Maximum value of type **unsigned long**.
Minimum Acceptable Value: 4 294 967 295

{USHRT_MAX}
Maximum value for a type **unsigned short**.
Minimum Acceptable Value: 65 535

XSI {WORD_BIT}
Number of bits in a word or type **int**.
Minimum Acceptable Value: 16

{CHAR_MIN}
Minimum value of type **char**.
Maximum Acceptable Value: {SCHAR_MIN} or 0

{INT_MIN}
Minimum value of type **int**.
Maximum Acceptable Value: –2 147 483 647

{LONG_MIN}
Minimum value of type **long**.
Maximum Acceptable Value: –2 147 483 647

{SCHAR_MIN}
Minimum value of type **signed char**.
Maximum Acceptable Value: –127

{SHRT_MIN}
Minimum value of type **short**.
Maximum Acceptable Value: –32 767

{LLONG_MIN}
Minimum value of type **long long**.
Maximum Acceptable Value: –9223372036854775807

{LLONG_MAX}
Maximum value of type **long long**.
Minimum Acceptable Value: +9223372036854775807

{ULLONG_MAX}
Maximum value of type **unsigned long long**.
Minimum Acceptable Value: 18446744073709551615

Other Invariant Values

XSI The following constants shall be defined on all implementations in **<limits.h>**:

XSI {CHARCLASS_NAME_MAX}
Maximum number of bytes in a character class name.
Minimum Acceptable Value: 14

XSI {NL_ARGMAX}
Maximum value of *digit* in calls to the *printf*( ) and *scanf*( ) functions.
Minimum Acceptable Value: 9

XSI {NL_LANGMAX}
Maximum number of bytes in a *LANG* name.
Minimum Acceptable Value: 14

XSI {NL_MSGMAX}
Maximum message number.
Minimum Acceptable Value: 32 767

XSI {NL_NMAX}
Maximum number of bytes in an N-to-1 collation mapping.
Minimum Acceptable Value: `'*'`

XSI {NL_SETMAX}
Maximum set number.
Minimum Acceptable Value: 255

XSI {NL_TEXTMAX}
Maximum number of bytes in a message string.
Minimum Acceptable Value: {_POSIX2_LINE_MAX}

XSI {NZERO}
Default process priority.
Minimum Acceptable Value: 20

9630 XSI {TMP_MAX}
9631 Minimum number of unique path names generated by *tmpnam*( ). Maximum number of
9632 times an application can call *tmpnam*( ) reliably. (**LEGACY**)
9633 Minimum Acceptable Value: 10 000

9634 **APPLICATION USAGE**
9635 None.

9636 **RATIONALE**
9637 A request was made to reduce the value of {_POSIX_LINK_MAX} from the value of 8 specified
9638 for it in the POSIX.1-1990 standard to 2. The standard developers decided to deny this request
9639 for several reasons.

9640 • They wanted to avoid making any changes to the standard that could break conforming
9641 applications, and the requested change could have that effect.

9642 • The use of multiple hard links to a file cannot always be replaced with use of symbolic links.
9643 Symbolic links are semantically different from hard links in that they associate a path name
9644 with another path name rather than a path name with a file. This has implications for access
9645 control, file permanence, and transparency.

9646 • The original standard developers had considered the issue of allowing for implementations |
9647 that did not in general support hard links, and decided that this would reduce consensus on |
9648 the standard. |

9649 Systems that support historical versions of the development option of the ISO POSIX-2 standard
9650 retain the name {_POSIX2_RE_DUP_MAX} as an alias for {_POSIX_RE_DUP_MAX}.

9651 {PATH_MAX}
9652 IEEE PASC Interpretation 1003.1 #15 addressed the inconsistency in the standard with the |
9653 definition of path name and the description of {PATH_MAX}, allowing application writers |
9654 to allocate either {PATH_MAX} or {PATH_MAX}+1 bytes. The inconsistency has been
9655 removed by correction to the {PATH_MAX} definition to include the null character. With
9656 this change, applications that previously allocated {PATH_MAX} bytes will continue to
9657 succeed.

9658 {SYMLINK_MAX}
9659 This symbol refers to space for data that is stored in the file system, as opposed to
9660 {PATH_MAX} which is the length of a name that can be passed to a function. In some
9661 existing implementations, the file names pointed to by symbolic links are stored in the
9662 inodes of the links, so it is important that {SYMLINK_MAX} not be constrained to be as
9663 large as {PATH_MAX}.

9664 **FUTURE DIRECTIONS**
9665 None.

9666 **SEE ALSO**
9667 The System Interfaces volume of IEEE Std. 1003.1-200x, *fpathconf*( ), *pathconf*( ), *sysconf*( )

9668 **CHANGE HISTORY**
9669 First released in Issue 1.

9670 **Issue 4**
9671 A sentence is added to the DESCRIPTION indicating that names beginning with _POSIX can be
9672 found in **<unistd.h>**.

9673 The {PASS_MAX} and {TMP_MAX} symbols are marked LEGACY. |

Use of the terms ‘‘bytes’’ and ‘‘characters’’ is rationalized to make it clear when the description is referring to either single-byte values or possibly multi-byte characters.

{CHARCLASS_NAME_MAX} is added to the list of **Other Invariant Values** and marked as an extension.

This entry is largely restructured to improve symbol grouping. A great many symbols, too numerous to mention, have also been added for alignment with the ISO POSIX-2 standard.

The following changes are incorporated for alignment with the ISO C standard:

- The constants {INT_MIN}, {LONG_MIN}, and {SHRT_MIN} are changed from values ending in 8 to ones ending in 7.
- The {DBL_DIG}, {DBL_MAX}, {FLT_DIG}, and {FLT_MAX} symbols are marked both as extensions and LEGACY.
- The {LONG_BIT} and {WORD_BIT} symbols are marked as extensions.
- The {DBL_MIN} and {FLT_MIN} symbols are withdrawn.
- Text introducing numerical limits now indicates that they are constant expressions suitable for use in **#if** preprocessing directives.

The following change is incorporated for alignment with the FIPS requirements:

- The minimum acceptable value for {NGROUPS_MAX} is changed from {_POSIX_NGROUPS_MAX} to 8. This is marked as as extension.

Issue 4, Version 2

The DESCRIPTION is revised for X/OPEN UNIX conformance as follows:

- Under **Runtime Invariant Values**, {ATEXIT_MAX}, {IOV_MAX}, {PAGESIZE}, and {PAGE_SIZE} are added.
- Under **Minimum Values**, {_XOPEN_IOV_MAX} is added.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

{FILESIZEBITS} added for the Large File Summit extensions.

The minimum acceptable values for {INT_MAX}, {INT_MIN}, and {UINT_MAX} are changed to make 32-bit values the minimum requirement.

The entry is restructured to improve readability.

Issue 6

The Open Group corrigenda item U033/4 has been applied. The wording is made clear for {CHAR_MIN}, {INT_MIN}, {LONG_MIN}, {SCHAR_MIN}, and {SHRT_MIN} that these are maximum acceptable values.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The minimum value for {CHILD_MAX} is 25. This is a FIPS requirement.
- The minimum value for {OPEN_MAX} is 20. This is a FIPS requirement.
- The minimum value for {NGROUPS_MAX} is 8. This is also a FIPS requirement.

Symbolic constants are added for {_POSIX_SYMLINK_MAX}, {_POSIX_SYMLOOP_MAX}, {_POSIX_RE_DUP_MAX}, {RE_DUP_MAX}, {SYMLOOP_MAX}, and {SYMLINK_MAX}.

The following values are added for alignment with IEEE Std. 1003.1d-1999:

{_POSIX_SS_REPL_MAX}
{SS_REPL_MAX}
{POSIX_ALLOC_SIZE_MIN}
{POSIX_REC_INCR_XFER_SIZE}
{POSIX_REC_MAX_XFER_SIZE}
{POSIX_REC_MIN_XFER_SIZE}
{POSIX_REC_XFER_ALIGN}

Reference to CLOCK_MONOTONIC is added in the description of {_POSIX_CLOCKRES_MIN} for alignment with IEEE Std. 1003.1j-2000.

The constants {LLONG_MIN}, {LLONG_MAX}, and {ULLONG_MAX} are added for alignment with the ISO/IEC 9899:1999 standard.

The following values are added for alignment with IEEE Std. 1003.1q-2000: {_POSIX_TRACE_EVENT_NAME_MAX}, {_POSIX_TRACE_NAME_MAX}, {_POSIX_TRACE_SYS_MAX}, {_POSIX_TRACE_USER_EVENT_MAX}, {TRACE_EVENT_NAME_MAX}, {TRACE_NAME_MAX}, {TRACE_SYS_MAX}, {TRACE_USER_EVENT_MAX}

NAME

locale.h — category macros

SYNOPSIS

```
#include <locale.h>
```

DESCRIPTION

CX The functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of symbols in this header.

The **<locale.h>** header shall provide a definition for structure **lconv**, which shall include at least the following members. (See the definitions of *LC_MONETARY* in the Section 7.3.3 (on page 163), and Section 7.3.4 (on page 166).)

```
char    *currency_symbol
char    *decimal_point
char     frac_digits
char    *grouping
char    *int_curr_symbol
char     int_frac_digits
char     int_n_cs_precedes
char     int_n_sep_by_space
char     int_n_sign_posn
char     int_p_cs_precedes
char     int_p_sep_by_space
char     int_p_sign_posn
char    *mon_decimal_point
char    *mon_grouping
char    *mon_thousands_sep
char    *negative_sign
char     n_cs_precedes
char     n_sep_by_space
char     n_sign_posn
char    *positive_sign
char     p_cs_precedes
char     p_sep_by_space
char     p_sign_posn
char    *thousands_sep
```

The **<locale.h>** header shall define NULL (as defined in **<stddef.h>**) and at least the following as macros:

LC_ALL
LC_COLLATE
LC_CTYPE
LC_MESSAGES
LC_MONETARY
LC_NUMERIC
LC_TIME

which shall expand to distinct integral constant expressions, for use as the first argument to the *setlocale*( ) function.

Additional macro definitions, beginning with the characters *LC_* and an uppercase letter, may also be given here.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
struct  lconv *localeconv (void);
char    setlocale(int, const char *);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The System Interfaces volume of IEEE Std. 1003.1-200x, *localeconv*( ), *setlocale*( ), Chapter 8 (on page 187)

CHANGE HISTORY

First released in Issue 3.

Entry included for alignment with the ISO C standard.

Issue 4

The following changes are incorporated for alignment with the ISO C standard:

- The function declarations in this header are expanded to full ISO C standard prototypes.
- The definition of **struct lconv**is**added.**
- A reference to **<stddef.h>** is added for the definition of NULL.

Issue 6

The **lconv** structure is expanded with new members (**int_n_cs_precedes**, **int_n_sep_by_space**, **int_n_sign_posn**, **int_p_cs_precedes**, **int_p_sep_by_space**, and **int_p_sign_posn**) for alignment with the ISO / IEC 9899: 1999 standard.

NAME

math.h — mathematical declarations

SYNOPSIS

```
#include <math.h>
```

DESCRIPTION

CX The functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of symbols in this header.

The **<math.h>** header shall include definitions for at least the following types:

float_t A floating type at least as wide as **float**.

double_t A floating type at least as wide as **double**, and at least as wide as **float_t**.

If FLT_EVAL_METHOD equals 0, **float_t** and **double_t** shall be **float** and **double**, respectively; if FLT_EVAL_METHOD equals 1, they shall both be **double**; if FLT_EVAL_METHOD equals 2, they shall both be **long double**; for other values of FLT_EVAL_METHOD, they are otherwise implementation-defined.

The **<math.h>** header shall define the following macros, where **real-floating** indicates that the argument shall be an expression of **real-floating** type:

```
int fpclassify(real-floating x);
int isfinite(real-floating x);
int isinf(real-floating x);
int isnan(real-floating x);
int isnormal(real-floating x);
int signbit(real-floating x);
int isgreater(real-floating x, real-floating y);
int isgreaterequal(real-floating x, real-floating y);
int isless(real-floating x, real-floating y);
int islessequal(real-floating x, real-floating y);
int islessgreater(real-floating x, real-floating y);
int isunordered(real-floating x, real-floating y);
```

The **<math.h>** header shall provide for the following constants. The values are of type **double** and are accurate within the precision of the **double** type.

XSI

M_E	Value of e
M_LOG2E	Value of $\log_2 e$
M_LOG10E	Value of $\log_{10} e$
M_LN2	Value of $\log_e 2$
M_LN10	Value of $\log_e 10$
M_PI	Value of π
M_PI_2	Value of $\pi/2$
M_PI_4	Value of $\pi/4$
M_1_PI	Value of $1/\pi$
M_2_PI	Value of $2/\pi$

M_2_SQRTPI	Value of $2/\sqrt{\pi}$	
M_SQRT2	Value of $\sqrt{2}$	
M_SQRT1_2	Value of $1/\sqrt{2}$	

The header shall define the following symbolic constants:

XSI

MAXFLOAT	Value of maximum non-infinite single-precision floating-point number.
HUGE_VAL	A positive **double** expression, not necessarily representable as a **float**. Used as an error value returned by the mathematics library. HUGE_VAL evaluates to +∞ on systems supporting IEEE Std. 754-1985.
HUGE_VALF	A positive **float** constant expression. Used as an error value returned by the mathematics library. HUGE_VALF evaluates to +infinity on systems supporting IEEE Std. 754-1985.
HUGE_VALD	A positive **long double** constant expression. Used as an error value returned by the mathematics library. HUGE_VALD evaluates to +infinity on systems supporting IEEE Std. 754-1985.
INFINITY	A constant expression of type **float** representing positive or unsigned infinity, if available; else a positive constant of type **float** that overflows at translation time.
NAN	A constant expression of type **float** representing a quiet NaN. This symbolic constant is only defined if the implementation supports quiet NaNs for the **float** type.

The following macros shall be defined for number classification. They represent the mutually-exclusive kinds of floating-point values. They expand to integer constant expressions with distinct values. Additional implementation-defined floating-point classifications, with macro definitions beginning with FP_ and an uppercase letter, may also be specified by the implementation.

FP_INFINITE
FP_NAN
FP_NORMAL
FP_SUBNORMAL
FP_ZERO

The following macros are optional. If FP_FATS_FMA is defined, it shall indicate that the *fma*( ) function generally executes about as fast as, or faster than, a multiply and an add of double operands.

FP_FAST_FMA
FP_FAST_FMAF
FP_FAST_FMAL

FP_FAST_FMAF and FP_FAST_FMAL are, respectively, **float** and **long double** analogs of FP_FAST_FMA.

The following macros shall expand to integer constant expressions whose values are returned by *ilogb*(*x*) if *x* is zero or NaN, respectively. The value of FP_ILOGB0 shall be either {INT_MIN} or –{INT_MAX}. The value of FP_ILOGBNAN shall be either {INT_MAX} or {INT_MIN}.

FP_ILOGB0
FP_ILOGBNAN

The following macros shall expand to the integer constants 1 and 2, respectively;

MATH_ERRNO
MATH_ERREXCEPT

The following macro shall expand to an expression that has type **int** and the value MATH_ERRNO, MATH_ERREXCEPT, or the bitwise-inclusive OR of both. The value of *math_errhandling* is constant for the duration of the program. It is unspecified whether *math_errhandling* is a macro or an identifier with external linkage. If a macro definition is suppressed or a program defines an identifier with the name *math_errhandling*, the behavior is undefined. If the expression *math_errhandling* & MATH_ERREXCEPT can be non-zero, the implementation shall define the macros FE_DIVBYZERO, FE_INVALID, and FE_OVERFLOW in **<fenv.h>**.

math_errhandling

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
double      acos(double);
float       acosf(float);
XSI double      acosh(double);
float       acoshf(float);
long double acoshl(long double);
long double acosl(long double);
double      asin(double);
float       asinf(float);
XSI double      asinh(double);
float       asinhf(float);
long double asinhl(long double);
long double asinl(long double);
double      atan(double);
double      atan2(double, double);
float       atan2f(float, float);
long double atan2l(long double, long double);
float       atanf(float);
XSI double      atanh(double);
float       atanhf(float);
long double atanhl(long double);
long double atanl(long double);
XSI double      cbrt(double);
float       cbrtf(float);
long double cbrtl(long double);
double      ceil(double);

10082          double      y1(double);
10083          double      yn(int, double);
10084
```

10085 The following external variable shall be defined:

```
10086 XSI      extern int signgam;
10087
```

APPLICATION USAGE

The FP_CONTRACT pragma can be used to allow (if the state is on) or disallow (if the state is off) the implementation to contract expressions. Each pragma can occur either outside external declarations or preceding all explicit declarations and statements inside a compound statement. When outside external declarations, the pragma takes effect from its occurrence until another FP_CONTRACT pragma is encountered, or until the end of the translation unit. When inside a compound statement, the pragma takes effect from its occurrence until another FP_CONTRACT pragma is encountered (including within a nested compound statement), or until the end of the compound statement; at the end of a compound statement the state for the pragma is restored to its condition just before the compound statement. If this pragma is used in any other context, the behavior is undefined. The default state (on or off) for the pragma is implementation-defined.

RATIONALE

Before the ISO/IEC 9899:1999 standard, the math library was defined only for the floating type **double**. All the names formed by appending `'f'` or `'l'` to a name in **<math.h>** were reserved to allow for the definition of **float** and **long double** libraries; and the ISO/IEC 9899:1999 standard provides for all three versions of math functions.

The functions *ecvt*(), *fcvt*(), and *gcvt*() have been dropped from the ISO C standard since their capability is available through *sprintf*(). These are provided on XSI-conformant systems supporting the Legacy Option Group.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 1.

Issue 4

The constants M_E and MAXFLOAT are marked as extensions.

The functions declared in this header are subdivided into those defined in the ISO C standard, and those defined only by The Open Group. Functions in the latter group are marked as extensions, as is the external variable *signgam*.

The following changes are incorporated for alignment with the ISO C standard:

- The description of HUGE_VAL is changed to indicate that this value is not necessarily representable as a **float**.
- The function declarations in this header are expanded to full ISO C standard prototypes.

Issue 4, Version 2

The following change is incorporated for X/OPEN UNIX conformance:

- The *acosh*(), *asinh*(), *atanh*(), *cbrt*(), *expm1*(), *ilogb*(), *log1p*(), *logb*(), *nextafter*(), *remainder*(), *rint*(), and *scalb*() functions are added to the list of functions declared in this header.

Issue 6

This reference page is updated to align with the ISO/IEC 9899:1999 standard.

NAME

monetary.h — monetary types

SYNOPSIS

XSI
```
#include <monetary.h>
```

DESCRIPTION

The **<monetary.h>** header shall define the following data types through **typedef**:

size_t As described in **<stddef.h>**.

ssize_t As described in **<sys/types.h>**.

The following shall be declared as a function and may also be defined as a macro. Function prototypes shall be provided for use with an ISO C standard compiler.

```
ssize_t  strfmon(char *restrict, size_t, const char *restrict, ...);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The System Interfaces volume of IEEE Std. 1003.1-200x, *strfmon*( )

CHANGE HISTORY

First released in Issue 4.

Issue 6

The **restrict** keyword is added to the prototype for *strfmon*( ).

NAME

mqueue.h — message queues (**REALTIME**)

SYNOPSIS

MSG
```
#include <mqueue.h>
```

DESCRIPTION

The **<mqueue.h>** header shall define the **mqd_t** type, which is used for message queue descriptors. This is not an array type.

The **<mqueue.h>** header shall define the **sigevent** structure (as described in **<signal.h>**) and the **mq_attr** structure, which is used in getting and setting the attributes of a message queue. Attributes are initially set when the message queue is created. An **mq_attr** structure shall have at least the following fields:

`long`	`mq_flags`	Message queue flags.
`long`	`mq_maxmsg`	Maximum number of messages.
`long`	`mq_msgsize`	Maximum message size.
`long`	`mq_curmsgs`	Number of messages currently queued.

The following shall be declared as functions and may also be declared as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
int      mq_close(mqd_t);
int      mq_getattr(mqd_t, struct mq_attr *);
int      mq_notify(mqd_t, const struct sigevent *);
mqd_t    mq_open(const char *, int, ...);
ssize_t  mq_receive(mqd_t, char *, size_t, unsigned *);
int      mq_send(mqd_t, const char *, size_t, unsigned );
int      mq_setattr(mqd_t, const struct mq_attr *restrict,
             struct mq_attr *restrict);
```
TMO
```
int      mq_timedreceive(mqd_t, char *restrict, size_t,
             unsigned *restrict, const struct timespec *restrict);
int      mq_timedsend(mqd_t, const char *, size_t, unsigned ,
             const struct timespec *);
int      mq_unlink(const char *);
```

Notes to Reviewers

This section with side shading will not appear in the final copy. - Ed.

D3, XBD, ERN 163: The return type from mq_timedreceive() should be ssize_t and not int. An interpretation should be filed against .1d to bring this change into scope.

Inclusion of the **<mqueue.h>** header may make visible symbols defined in the headers **<fcntl.h>**, **<signal.h>**, **<sys/types.h>**, and **<time.h>**.

10192 **APPLICATION USAGE**

10193 None.

10194 **RATIONALE**

10195 None.

10196 **FUTURE DIRECTIONS**

10197 None.

10198 **SEE ALSO**

10201 *mq_setattr*( ), *mq_timedreceive*( ), *mq_timedsend*( ), *mq_unlink*( )

10202 **CHANGE HISTORY**

10203 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

10204 **Issue 6**

10205 The **<mqueue.h>** header is marked as part of the Message Passing option. |

10206 The *mq_timedreceive*( ) and *mq_timedsend*( ) functions are added for alignment with
10207 IEEE Std. 1003.1d-1999. |

10208 The **restrict** keyword is added to the prototypes for *mq_setattr*( ) and *mq_timedreceive*( ). |

NAME

ndbm.h — definitions for ndbm database operations

SYNOPSIS

XSI
```
#include <ndbm.h>
```

DESCRIPTION

The **<ndbm.h>** header shall define the **datum** type as a structure that includes at least the following members:

`void *dptr` A pointer to the application's data.

`size_t dsize` The size of the object pointed to by *dptr*.

The **size_t** type shall be defined through **typedef** as described in **<stddef.h>**.

The **<ndbm.h>** header shall define the **DBM** type through **typedef**.

The following constants shall be defined as possible values for the *store_mode* argument to *dbm_store*( ):

DBM_INSERT Insertion of new entries only.

DBM_REPLACE Allow replacing existing entries.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
int     dbm_clearerr(DBM *);
void    dbm_close(DBM *);
int     dbm_delete(DBM *, datum);
int     dbm_error(DBM *);
datum   dbm_fetch(DBM *, datum);
datum   dbm_firstkey(DBM *);
datum   dbm_nextkey(DBM *);
DBM    *dbm_open(const char *, int, mode_t);
int     dbm_store(DBM *, datum, datum, int);
```

The **mode_t** type shall be defined through **typedef** as described in **<sys/types.h>**.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The System Interfaces volume of IEEE Std. 1003.1-200x, *dbm_clearerr*( )

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

References to the definitions of **size_t** and **mode_t** are added to the DESCRIPTION.

10249 **NAME**

10250 net/if.h — sockets local interfaces

10251 **SYNOPSIS**

10252 `#include <net/if.h>`

10253 **DESCRIPTION**

10254 The **<net/if.h>** header shall define the **if_nameindex** structure that includes at least the
10255 following members:

10256 `unsigned if_index` Numeric index of the interface.
10257 `char *if_name` Null-terminated name of the interface.

10258 The **<net/if.h>** header shall define the following macro for the length of a buffer containing an
10259 interface name (including the terminating NULL character):

10260 IF_NAMESIZE Interface name length.

10261 The following shall be declared as functions, and may also be defined as macros. Function
10262 prototypes shall be provided for use with an ISO C standard compiler.

```
10263 unsigned              if_nametoindex(const char*);
10264 char                 *if_indextoname(unsigned, char*);
10265 struct if_nameindex  *if_nameindex(void);
10266 void                  if_freenameindex(struct if_nameindex*);
```

10267 **APPLICATION USAGE**

10268 None.

10269 **RATIONALE**

10270 None.

10276 **CHANGE HISTORY**

10277 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

10278 **NAME**

10279 netdb.h — definitions for network database operations

10280 **SYNOPSIS**

10281 `#include <netdb.h>`

10282 **DESCRIPTION**

10283 The **<netdb.h>** header may make available the **in_port_t** type and the **in_addr_t** type as defined
10284 in **<netinet/in.h>**.

10285 The **<netdb.h>** header shall define the **hostent** structure that includes at least the following
10286 members:

10287	`char *h_name`	Official name of the host.
10288	`char **h_aliases`	A pointer to an array of pointers to
10289		alternative host names, terminated by a
10290		null pointer.
10291	`int h_addrtype`	Address type.
10292	`int h_length`	The length, in bytes, of the address.
10293	`char **h_addr_list`	A pointer to an array of pointers to network
10294		addresses (in network byte order) for the host,
10295		terminated by a null pointer.

10296 The **<netdb.h>** header shall define the **netent** structure that includes at least the following
10297 members:

10298	`char *n_name`	Official, fully-qualified (including the
10299		domain) name of the host.
10300	`char **n_aliases`	A pointer to an array of pointers to
10301		alternative network names, terminated by a
10302		null pointer.
10303	`int n_addrtype`	The address type of the network.
10304	`uint32_t n_net`	The network number, in host byte order.

10305 The **uint32_t** type shall be defined as described in **<inttypes.h>**.

10306 The **<netdb.h>** header shall define the **protoent** structure that includes at least the following
10307 members:

10308	`char *p_name`	Official name of the protocol.
10309	`char **p_aliases`	A pointer to an array of pointers to
10310		alternative protocol names, terminated by
10311		a null pointer.
10312	`int p_proto`	The protocol number.

10313 The **<netdb.h>** header shall define the **servent** structure that includes at least the following
10314 members:

10315	`char *s_name`	Official name of the service.
10316	`char **s_aliases`	A pointer to an array of pointers to
10317		alternative service names, terminated by
10318		a null pointer.
10319	`int s_port`	The port number at which the service
10320		resides, in network byte order.
10321	`char *s_proto`	The name of the protocol to use when
10322		contacting the service.

The **<netdb.h>** header shall define the IPPORT_RESERVED macro with the value of the highest reserved Internet port number.

When the **<netdb.h>** header is included, *h_errno* shall be available as a modifiable *l*-value of type **int**. It is unspecified whether *h_errno* is a macro or an identifier declared with external linkage.

The **<netdb.h>** header shall define the following macros for use as error values for *gethostbyaddr*( ), *gethostbyname*( ), *getipnodebyaddr*( ), and *getipnodebyname*( ):

HOST_NOT_FOUND
NO_DATA
NO_RECOVERY
TRY_AGAIN

The **<netdb.h>** header shall define the following macros that evaluate to bitwise-distinct integer constants, for use in the *flags* argument of *getipnodebyname*( ):

IP6 AI_V4MAPPED IPv4-mapped IPv6 addresses are acceptable.

AI_ALL Return all addresses: IPv6 and IPv4-mapped IPv6.

AI_ADDRCONFIG
Return addresses depending on what source addresses are configured.

The **<netdb.h>** header shall define the AI_DEFAULT macro, which evaluates to the logical OR of AI_V4MAPPED and AI_ADDRCONFIG.

Address Information Structure

The **<netdb.h>** header shall define the **addrinfo** structure that includes at least the following members:

```
int               ai_flags      Input flags.
int               ai_family     Address family of socket.
int               ai_socktype   Socket type.
int               ai_protocol   Protocol of socket.
socklen_t         ai_addrlen    Length of socket address.
struct sockaddr  *ai_addr       Socket address of socket.
char             *ai_canonname  Canonical name of service location.
struct addrinfo  *ai_next       Pointer to next in list.
```

The **<netdb.h>** header shall define the following macros that evaluate to bitwise-distinct integer constants for use in the *flags* field of the **addrinfo** structure:

AI_PASSIVE Socket address is intended for *bind*( ).

AI_CANONNAME
Request for canonical name.

AI_NUMERICHOST
Return numeric host address as name.

The **<netdb.h>** header shall define the following macros that evaluate to bitwise-distinct integer constants for use in the *flags* argument to *getnameinfo*( ):

NI_NOFQDN Only the nodename portion of the FQDN is returned for local hosts.

NI_NUMERICHOST
The numeric form of the node's address is returned instead of its name.

NI_NAMEREQD Return an error if the node's name cannot be located in the database.

NI_NUMERICSERV
The numeric form of the service address is returned instead of its name.

NI_DGRAM Indicates that the service is a datagram service (SOCK_DGRAM).

Address Information Errors

The **<netdb.h>** header shall define the following macros for use as error values for *getaddrinfo*( ) and *getnameinfo*( ):

EAI_AGAIN The name could not be resolved at this time. Future attempts may succeed.

EAI_BADFLAGS The flags had an invalid value.

EAI_FAIL A non-recoverable error occurred.

EAI_FAMILY The address family was not recognized or the address length was invalid for the specified family.

EAI_MEMORY There was a memory allocation failure.

EAI_NONAME The name does not resolve for the supplied parameters.

NI_NAMEREQD is set and the host's name cannot be located, or both *nodename* and *servname* were null.

EAI_SERVICE The service passed was not recognized for the specified socket type.

EAI_SOCKTYPE The intended socket type was not recognized.

EAI_SYSTEM A system error occurred. The error code can be found in *errno*.

The following shall be declared as functions, and may also be defined as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
void              endhostent(void);
void              endnetent(void);
void              endprotoent(void);
void              endservent(void);
void              freeaddrinfo(struct addrinfo *);
void              freehostent(struct hostent *);
char             *gai_strerror(int);
int               getaddrinfo(const char *, const char *,
                      const struct addrinfo *, struct addrinfo **);
struct hostent   *gethostbyaddr(const void *, socklen_t, int);
struct hostent   *gethostbyname(const char *);
struct hostent   *gethostent(void);
struct hostent   *getipnodebyaddr(const void *restrict, socklen_t, int,
                      int *restrict);
struct hostent   *getipnodebyname(const char *, int, int, int *);
int               getnameinfo(const struct sockaddr *, socklen_t,
                      char *, socklen_t, char *, socklen_t, unsigned);
struct netent    *getnetbyaddr(uint32_t, int);
struct netent    *getnetbyname(const char *);
struct netent    *getnetent(void);
struct protoent  *getprotobyname(const char *);
struct protoent  *getprotobynumber(int);
struct protoent  *getprotoent(void);
```

```
struct servent   *getservbyname(const char *, const char *);
struct servent   *getservbyport(int, const char *);
struct servent   *getservent(void);
void              sethostent(int);
void              setnetent(int);
void              setprotoent(int);
void              setservent(int);
```

The type **socklen_t** shall be defined through **typedef** as described in **<sys/socket.h>**.

Inclusion of the **<netdb.h>** header may also make visible all symbols from **<netinet/in.h>** and **<inttypes.h>**.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the prototype for *getipnodebyaddr*( ).

10431 **NAME**

10432 netinet/in.h — Internet protocol family

10433 **SYNOPSIS**

10434 `#include <netinet/in.h>`

10435 **DESCRIPTION**

10436 The **<netinet/in.h>** header shall define the following types through **typedef**:

10437 **in_port_t** An unsigned integer type of exactly 16 bits.

10438 **in_addr_t** An unsigned integer type of exactly 32 bits.

10439 The **sa_family_t** type shall be defined as described in **<sys/socket.h>**.

10440 The **uint32_t** type shall be defined as described in **<inttypes.h>**. Inclusion of the **<netinet/in.h>**
10441 header may also make visible all symbols from **<inttypes.h>**.

10442 The **<netinet/in.h>** header shall define the **in_addr** structure that includes at least the following
10443 member:

10444 `in_addr_t  s_addr`

10445 The **<netinet/in.h>** header shall define the **sockaddr_in** structure that includes at least the
10446 following members:

```
10447 sa_family_t     sin_family
10448 in_port_t       sin_port
10449 struct in_addr  sin_addr
10450 unsigned char   sin_zero[8]
```

10451 The **sockaddr_in** structure is used to store addresses for the Internet protocol family. Values of
10452 this type shall be cast by applications to **struct sockaddr** for use with socket functions.

10453 IP6 The **<netinet/in.h>** header shall define the **in6_addr** structure that contains at least the following
10454 member:

10455 `uint8_t s6_addr[16]`

10456 This array is used to contain a 128-bit IPv6 address, stored in network byte order.

10457 The **<netinet/in.h>** header shall define the **sockaddr_in6** structure that includes at least the
10458 following members:

10459 `sa_family_t`	`sin6_family`	AF_INET6.
10460 `in_port_t`	`sin6_port`	Port number.
10461 `uint32_t`	`sin6_flowinfo`	IPv6 traffic class and flow information.
10462 `struct in6_addr`	`sin6_addr`	IPv6 address.
10463 `uint32_t`	`sin6_scope_id`	Set of interfaces for a scope.

10464 The **sockaddr_in6** structure shall be set to zero by an application prior to using it, since
10465 implementations are free to have additional, implementation-defined fields in **sockaddr_in6**.

10466 The *sin6_scope_id* field is a 32-bit integer that identifies a set of interfaces as appropriate for the
10467 scope of the address carried in the *sin6_addr* field. For a link scope *sin6_addr*, *sin6_scope_id* would
10468 be an interface index. For a site scope *sin6_addr*, *sin6_scope_id* would be a site identifier. The
10469 mapping of *sin6_scope_id* to an interface or set of interfaces is implementation-defined.

10470 The **<netinet/in.h>** header shall declare the following external variable:

10471 `struct in6_addr in6addr_any`

This variable is initialized by the system to contain the wildcard IPv6 address. The **<netinet/in.h>** header also defines the IN6ADDR_ANY_INIT macro. This macro must be constant at compile time and can be used to initialize a variable of type **struct in6_addr** to the IPv6 wildcard address.

The **<netinet/in.h>** header shall declare the following external variable:

```
struct in6_addr in6addr_loopback
```

This variable is initialized by the system to contain the loopback IPv6 address. The **<netinet/in.h>** header also defines the IN6ADDR_LOOPBACK_INIT macro. This macro must be constant at compile time and can be used to initialize a variable of type **struct in6_addr** to the IPv6 loopback address.

The **<netinet/in.h>** header shall define the **ipv6_mreq** structure that includes at least the following members:

```
struct in6_addr  ipv6mr_multiaddr   IPv6 multicast address.
unsigned         ipv6mr_interface   Interface index.
```

The **<netinet/in.h>** header shall define the following macros for use as values of the *level* argument of *getsockopt*( ) and *setsockopt*( ):

IPPROTO_IP	Internet protocol.
IP6 IPPROTO_IPV6	Internet Protocol Version 6.
IPPROTO_ICMP	Control message protocol.
IPPROTO_TCP	Transmission control protocol.
IPPROTO_UDP	User datagram protocol.

The **<netinet/in.h>** header shall define the following macros for use as destination addresses for *connect*( ), *sendmsg*( ), and *sendto*( ):

INADDR_ANY	IPv4 local host address.
INADDR_BROADCAST	IPv4 broadcast address.

The **<netinet/in.h>** header shall define the following macro to help applications declare buffers of the proper size to store IPv4 addresses in string form:

INET_ADDRSTRLEN	16.

The *htonl*( ), *htons*( ), *ntohl*( ), and *ntohs*( ) functions shall be available as defined in **<arpa/inet.h>**. Inclusion of the **<netinet/in.h>** header may also make visible all symbols from **<arpa/inet.h>**.

IP6 The **<netinet/in.h>** header shall define the following macro to help applications declare buffers of the proper size to store IPv6 addresses in string form:

INET6_ADDRSTRLEN	46.

The **<netinet/in.h>** header shall define the following macros, with distinct integral values, for use in the *option_name* argument in the *getsockopt*( ) or *setsockopt*( ) functions at protocol level IPPROTO_IPV6:

IPV6_JOIN_GROUP	Join a multicast group.
IPV6_LEAVE_GROUP	Quit a multicast group.

IPV6_MULTICAST_HOPS
: Multicast hop limit.

IPV6_MULTICAST_IF
: Interface to use for outgoing multicast packets.

IPV6_MULTICAST_LOOP
: Multicast packets are delivered back to the local application.

IPV6_UNICAST_HOPS
: Unicast hop limit.

The **<netinet/in.h>** header shall define the following macros that test for special IPv6 addresses. Each macro is of type **int** and takes a single argument of type **const struct in6_addr** *:

IN6_IS_ADDR_UNSPECIFIED
: Unspecified address.

IN6_IS_ADDR_LOOPBACK
: Loopback address.

IN6_IS_ADDR_MULTICAST
: Multicast address.

IN6_IS_ADDR_LINKLOCAL
: Unicast link-local address.

IN6_IS_ADDR_SITELOCAL
: Unicast site-local address.

IN6_IS_ADDR_V4MAPPED
: IPv4 mapped address.

IN6_IS_ADDR_V4COMPAT
: IPv4-compatible address.

IN6_IS_ADDR_MC_NODELOCAL
: Multicast node-local address.

IN6_IS_ADDR_MC_LINKLOCAL
: Multicast link-local address.

IN6_IS_ADDR_MC_SITELOCAL
: Multicast site-local address.

IN6_IS_ADDR_MC_ORGLOCAL
: Multicast organization-local address.

IN6_IS_ADDR_MC_GLOBAL
: Multicast global address.

IN6_IS_ADDR_LINKLOCAL and IN6_IS_ADDR_SITELOCAL return true only for the two local-use IPv6 unicast addresses. They do not return true for multicast addresses of either link-local or site-local scope.

10546 **APPLICATION USAGE**

10556 **CHANGE HISTORY**

10557 First released in Issue 6. Derived from the XNS, Issue 5.2 specification. |

10558 **NAME**

10559 netinet/tcp.h — definitions for the Internet Transmission Control Protocol (TCP)

10560 **SYNOPSIS**

10561 `#include <netinet/tcp.h>`

10562 **DESCRIPTION**

10563 The **<netinet/tcp.h>** header shall define the following macro for use as a socket option at the
10564 IPPROTO_TCP level:

10565 TCP_NODELAY Avoid coalescing of small segments.

10566 The macro shall be defined in the header. The implementation need not allow the value of the
10567 option to be set via *setsockopt*( ) or retrieved via *getsockopt*( ).

10568 **APPLICATION USAGE**

10569 None.

10570 **RATIONALE**

10577 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

NAME

nl_types.h — data types

SYNOPSIS

XSI
```
#include <nl_types.h>
```

DESCRIPTION

The **<nl_types.h>** header shall contain definitions of at least the following types:

nl_catd Used by the message catalog functions *catopen*( ), *catgets*( ), and *catclose*( ) to identify a catalog descriptor.

nl_item Used by *nl_langinfo*( ) to identify items of *langinfo* data. Values of objects of type **nl_item** are defined in **<langinfo.h>**.

The **<nl_types.h>** header shall contain definitions of at least the following constants:

NL_SETD Used by *gencat* when no $*set* directive is specified in a message text source file; see the Internationalization Guide. This constant can be passed as the value of *set_id* on subsequent calls to *catgets*( ) (that is, to retrieve messages from the default message set). The value of NL_SETD is implementation-defined.

NL_CAT_LOCALE Value that must be passed as the *oflag* argument to *catopen*( ) to ensure that message catalog selection depends on the *LC_MESSAGES* locale category, rather than directly on the *LANG* environment variable.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
int       catclose(nl_catd);
char     *catgets(nl_catd, int, int, const char *);
nl_catd   catopen(const char *, int);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<langinfo.h>, the System Interfaces volume of IEEE Std. 1003.1-200x, *catclose*( ), *catgets*( ), *catopen*( ), *nl_langinfo*( ), the Shell and Utilities volume of IEEE Std. 1003.1-200x, *gencat*

CHANGE HISTORY

First released in Issue 2.

Issue 4

The following change is incorporated for alignment with the ISO C standard:

- The function declarations in this header are expanded to full ISO C standard prototypes.

NAME

poll.h — definitions for the poll( ) function

SYNOPSIS

XSI
```
#include <poll.h>
```

DESCRIPTION

The **<poll.h>** header shall define the **pollfd** structure that includes at least the following members:

`int`	`fd`	The following descriptor being polled.
`short`	`events`	The input event flags (see below).
`short`	`revents`	The output event flags (see below).

The **<poll.h>** header shall define the following type through **typedef**:

nfds_t An unsigned integer type used for the number of file descriptors. |

The following symbolic constants shall be defined, zero or more of which may be OR'ed together to form the *events* or *revents* members in the **pollfd** structure:

POLLIN	Same effect as POLLRDNORM | POLLRDBAND.
POLLRDNORM	Data on priority band 0 may be read.
POLLRDBAND	Data on priority bands greater than 0 may be read.
POLLPRI	High priority data may be read.
POLLOUT	Same value as POLLWRNORM.
POLLWRNORM	Data on priority band 0 may be written.
POLLWRBAND	Data on priority bands greater than 0 may be written. This event only examines bands that have been written to at least once.
POLLERR	An error has occurred (*revents* only).
POLLHUP	Device has been disconnected (*revents* only).
POLLNVAL	Invalid *fd* member (*revents* only).

The **<poll.h>** header shall declare the following function which may also be defined as a macro. Function prototypes shall be provided for use with an ISO C standard compiler.

```
int   poll(struct pollfd[], nfds_t, int);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

10654 **CHANGE HISTORY**

10655 First released in Issue 4, Version 2.

10656 **NAME**

10657 pthread.h — threads

10658 **SYNOPSIS**

10659 THR
```
#include <pthread.h>
```
10660

10661 **DESCRIPTION**

10662 The **<pthread.h>** header shall define the following symbols:

10663 BAR PTHREAD_BARRIER_SERIAL_THREAD
10664 PTHREAD_CANCEL_ASYNCHRONOUS
10665 PTHREAD_CANCEL_ENABLE
10666 PTHREAD_CANCEL_DEFERRED
10667 PTHREAD_CANCEL_DISABLE
10668 PTHREAD_CANCELED
10669 PTHREAD_COND_INITIALIZER
10670 PTHREAD_CREATE_DETACHED
10671 PTHREAD_CREATE_JOINABLE
10672 PTHREAD_EXPLICIT_SCHED
10673 PTHREAD_INHERIT_SCHED
10674 XSI PTHREAD_MUTEX_DEFAULT
10675 PTHREAD_MUTEX_ERRORCHECK
10676 PTHREAD_MUTEX_INITIALIZER
10677 XSI PTHREAD_MUTEX_NORMAL
10678 PTHREAD_MUTEX_RECURSIVE
10679 PTHREAD_ONCE_INIT
10680 TPP|TPI PTHREAD_PRIO_INHERIT
10681 PTHREAD_PRIO_NONE
10682 PTHREAD_PRIO_PROTECT
10683 PTHREAD_PROCESS_SHARED
10684 PTHREAD_PROCESS_PRIVATE
10685 TPS PTHREAD_SCOPE_PROCESS
10686 PTHREAD_SCOPE_SYSTEM
10687

10688 The following types shall be defined as described in **<sys/types.h>**:

10689 **pthread_attr_t**
10690 BAR **pthread_barrier_t**
10691 **pthread_barrierattr_t**
10692 **pthread_cond_t**
10693 **pthread_condattr_t**
10694 **pthread_key_t**
10695 **pthread_mutex_t**
10696 **pthread_mutexattr_t**
10697 **pthread_once_t**
10698 **pthread_rwlock_t**
10699 **pthread_rwlockattr_t**
10700 SPI **pthread_spinlock_t**
10701 **pthread_t**

10702 The following shall be declared as functions and may also be declared as macros. Function
10703 prototypes shall be provided for use with an ISO C standard compiler.

```
10704          int   pthread_atfork(void (*)(void), void (*)(void),
10705                    void(*)(void));
10706          int   pthread_attr_destroy(pthread_attr_t *);
10707          int   pthread_attr_getdetachstate(const pthread_attr_t *, int *);
10708 XSI      int   pthread_attr_getguardsize(const pthread_attr_t *restrict,
10709                    size_t *restrict);
10710 TPS      int   pthread_attr_getinheritsched(const pthread_attr_t *restrict,
10711                    int *restrict);
10712          int   pthread_attr_getschedparam(const pthread_attr_t *restrict,
10713                    struct sched_param *restrict);
10714 TPS      int   pthread_attr_getschedpolicy(const pthread_attr_t *restrict,
10715                    int *restrict);
10716 TPS      int   pthread_attr_getscope(const pthread_attr_t *restrict,
10717                    int *restrict);
10718 TSA      int   pthread_attr_getstackaddr(const pthread_attr_t *restrict,
10719                    void **restrict);
10720          int   pthread_attr_getstacksize(const pthread_attr_t *restrict,
10721                    size_t *restrict);
10722          int   pthread_attr_init(pthread_attr_t *);
10723          int   pthread_attr_setdetachstate(pthread_attr_t *, int);
10724 XSI      int   pthread_attr_setguardsize(pthread_attr_t *, size_t);
10725 TPS      int   pthread_attr_setinheritsched(pthread_attr_t *, int);
10726          int   pthread_attr_setschedparam(pthread_attr_t *restrict,
10727                    const struct sched_param *restrict);
10728 TPS      int   pthread_attr_setschedpolicy(pthread_attr_t *, int);
10729          int   pthread_attr_setscope(pthread_attr_t *, int);
10730 TSA      int   pthread_attr_setstackaddr(pthread_attr_t *, void *);
10731          int   pthread_attr_setstacksize(pthread_attr_t *, size_t);
10732 BAR      int   pthread_barrier_destroy(pthread_barrier_t *);
10733          int   pthread_barrier_init(pthread_barrier_t *restrict,
10734                    const pthread_barrierattr_t *restrict, unsigned);
10735          int   pthread_barrier_wait(pthread_barrier_t *);
10736          int   pthread_barrierattr_destroy(pthread_barrierattr_t *);
10737          int   pthread_barrierattr_getpshared(const pthread_barrierattr_t *restrict,
10738                    int *restrict);
10739          int   pthread_barrierattr_init(pthread_barrierattr_t *);
10740          int   pthread_barrierattr_setpshared(pthread_barrierattr_t *, int);
10741          int   pthread_cancel(pthread_t);
10742          void  pthread_cleanup_push(void (*)(void *), void *);

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The RTT margin markers are now broken out into their POSIX options.

The Open Group corrigenda item U021/9 has been applied, correcting the prototype for the *pthread_cond_wait*( ) function.

The Open Group corrigenda item U026/2 has been applied correcting the prototype for the *pthread_setschedparam*( ) function so that its second argument is of type **int**.

The *pthread_getcpuclockid*( ) and *pthread_mutex_timedlock*( ) functions are added for alignment with IEEE Std. 1003.1d-1999.

The following functions are added for alignment with IEEE Std. 1003.1j-2000: *pthread_barrier_destroy*( ), *pthread_barrier_init*( ), *pthread_barrier_wait*( ), *pthread_barrierattr_destroy*( ), *pthread_barrierattr_getpshared*( ), *pthread_barrierattr_init*( ), *pthread_barrierattr_setpshared*( ), *pthread_condattr_getclock*( ), *pthread_condattr_setclock*( ), *pthread_rwlock_timedrdlock*( ), *pthread_rwlock_timedwrlock*( ), *pthread_spin_destroy*( ), *pthread_spin_init*( ), *pthread_spin_lock*( ), *pthread_spin_trylock*( ), and *pthread_spin_unlock*( ).

PTHREAD_RWLOCK_INITIALIZER is deleted for alignment with IEEE Std. 1003.1j-2000.

Functions previously marked as part of the Read-Write Locks option are now moved to the Threads option.

The **restrict** keyword is added to the prototypes for *pthread_attr_getguardsize*( ), *pthread_attr_getinheritsched*( ), *pthread_attr_getschedparam*( ), *pthread_attr_getschedpolicy*( ), *pthread_attr_getscope*( ), *pthread_attr_getstackaddr*( ), *pthread_attr_getstacksize*( ), *pthread_attr_setschedparam*( ), *pthread_barrier_init*( ), *pthread_barrierattr_getpshared*( ), *pthread_cond_init*( ), *pthread_cond_signal*( ), *pthread_cond_timedwait*( ), *pthread_cond_wait*( ), *pthread_condattr_getclock*( ), *pthread_condattr_getpshared*( ), *pthread_create*( ), *pthread_getschedparam*( ), *pthread_mutex_getprioceiling*( ), *pthread_mutex_init*( ), *pthread_mutex_setprioceiling*( ), *pthread_mutexattr_getprioceiling*( ), *pthread_mutexattr_getprotocol*( ), *pthread_mutexattr_getpshared*( ), *pthread_mutexattr_gettype*( ), *pthread_rwlock_init*( ), *pthread_rwlock_timedrdlock*( ), *pthread_rwlock_timedwrlock*( ), *pthread_rwlockattr_getpshared*( ), and *pthread_sigmask*( ).

NAME

pwd.h — password structure

SYNOPSIS

```
#include <pwd.h>
```

DESCRIPTION

The **<pwd.h>** header shall provide a definition for **struct passwd**, which shall include at least the following members:

`char`	`*pw_name`	User's login name.
`uid_t`	`pw_uid`	Numerical user ID.
`gid_t`	`pw_gid`	Numerical group ID.
`char`	`*pw_dir`	Initial working directory.
`char`	`*pw_shell`	Program to use as shell.

The **gid_t** and **uid_t** types shall be defined as described in **<sys/types.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
struct passwd *getpwnam(const char *);
struct passwd *getpwuid(uid_t);
TSF int            getpwnam_r(const char *, struct passwd *, char *,
                       size_t, struct passwd **);
int            getpwuid_r(uid_t, struct passwd *, char *,
                       size_t, struct passwd **);
XSI void           endpwent(void);
struct passwd *getpwent(void);
void           setpwent(void);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<sys/types.h>, the System Interfaces volume of IEEE Std. 1003.1-200x, *endpwent*( ), *getpwnam*( ), *getpwuid*( )

CHANGE HISTORY

First released in Issue 1.

Issue 4

Reference to the **<sys/types.h>** header is added for the definitions of **gid_t** and **uid_t**. This is marked as an extension.

The following change is incorporated for alignment with the ISO POSIX-1 standard:

- The function declarations in this header are expanded to full ISO C standard prototypes.

Issue 4, Version 2

For X/OPEN UNIX conformance, the *getpwent*( ), *endpwent*( ), and *setpwent*( ) functions are added to the list of functions declared in this header.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The **gid_t** and **uid_t** types are mandated.
- The *getpwnam_r*( ) and *getpwuid_r*( ) functions are marked as part of the _POSIX_THREAD_SAFE_FUNCTIONS option.

NAME

regex.h — regular expression matching types

SYNOPSIS

```
#include <regex.h>
```

DESCRIPTION

The **<regex.h>** header shall define the structures and symbolic constants used by the *regcomp*( ), *regexec*( ), *regerror*( ), and *regfree*( ) functions.

The structure type **regex_t** shall contain at least the following member:

`size_t`	`re_nsub`	Number of parenthesized subexpressions.

The type **regoff_t** shall be defined as a signed arithmetic type that can hold the largest value that can be stored in either a type **off_t** or type **ssize_t**. The structure type **regmatch_t** shall contain at least the following members:

`regoff_t`	`rm_so`	Byte offset from start of string to start of substring.
`regoff_t`	`rm_eo`	Byte offset from start of string of the first character after the end of substring.

Values for the *cflags* parameter to the *regcomp*( ) function:

REG_EXTENDED	Use Extended Regular Expressions.
REG_ICASE	Ignore case in match.
REG_NOSUB	Report only success or fail in *regexec*( ).
REG_NEWLINE	Change the handling of newline.

Values for the *eflags* parameter to the *regexec*( ) function:

REG_NOTBOL	The circumflex character (`'^'`), when taken as a special character, does not match the beginning of *string*.
REG_NOTEOL	The dollar sign (`'$'`), when taken as a special character, does not match the end of *string*.

The following constants shall be defined as error return values:

REG_NOMATCH	*regexec*( ) failed to match.
REG_BADPAT	Invalid regular expression.
REG_ECOLLATE	Invalid collating element referenced.
REG_ECTYPE	Invalid character class type referenced.
REG_EESCAPE	Trailing `'\'` in pattern.
REG_ESUBREG	Number in *digit* invalid or in error.
REG_EBRACK	`"[]"` imbalance.
REG_EPAREN	`"\(\)"` or `"()"` imbalance.
REG_EBRACE	`"\{\}"` imbalance.
REG_BADBR	Content of `"\{\}"` invalid: not a number, number too large, more than two numbers, first larger than second.

REG_ERANGE	Invalid endpoint in range expression.	
REG_ESPACE	Out of memory.	
REG_BADRPT	`'?'`, `'*'`, or `'+'` not preceded by valid regular expression.	
REG_ENOSYS	The implementation does not support the function. (**LEGACY**)	

The following shall be declared as functions and may also be declared as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
int    regcomp(regex_t *restrict, const char *restrict, int);
size_t regerror(int, const regex_t *restrict, char *restrict, size_t);
int    regexec(const regex_t *restrict, const char *restrict, size_t,
           regmatch_t[restrict], int);
void   regfree(regex_t *);
```

The implementation may define additional macros or constants using names beginning with REG_.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The System Interfaces volume of IEEE Std. 1003.1-200x, *regcomp*( ), the Shell and Utilities volume of IEEE Std. 1003.1-200x

CHANGE HISTORY

First released in Issue 4.

Originally derived from the ISO POSIX-2 standard.

Issue 6

The REG_ENOSYS constant is marked LEGACY.

The **restrict** keyword is added to the prototypes for *regcomp*( ), *regerror*( ), and *regexec*( ).

NAME

sched.h — execution scheduling (**REALTIME**)

SYNOPSIS

PS
```
#include <sched.h>
```

DESCRIPTION

The **<sched.h>** header shall define the **sched_param** structure, which contains the scheduling parameters required for implementation of each supported scheduling policy. This structure shall contain at least the following member:

`int`	`sched_priority`	Process execution scheduling priority.

SS|TSP In addition, if _POSIX_SPORADIC_SERVER or _POSIX_THREAD_SPORADIC_SERVER is defined, the **sched_param** structure defined in **<sched.h>** shall contain the following members in addition to those specified above:

`int`	`sched_ss_low_priority`	Low scheduling priority for sporadic server.
`struct timespec`	`sched_ss_repl_period`	Replenishment period for sporadic server.
`struct timespec`	`sched_ss_init_budget`	Initial budget for sporadic server.
`int`	`sched_ss_max_repl`	Maximum pending replenishments for sporadic server.

Each process is controlled by an associated scheduling policy and priority. Associated with each policy is a priority range. Each policy definition specifies the minimum priority range for that policy. The priority ranges for each policy may overlap the priority ranges of other policies.

Four scheduling policies are defined; others may be defined by the implementation. The four standard policies are indicated by the values of the following symbolic constants:

SCHED_FIFO	First in-first out (FIFO) scheduling policy.
SCHED_RR	Round robin scheduling policy.
SS|TSP SCHED_SPORADIC	Sporadic server scheduling policy.
SCHED_OTHER	Another scheduling policy.

The values of these constants are distinct.

The following shall be declared as functions and may also be declared as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
int    sched_get_priority_max(int);
int    sched_get_priority_min(int);
int    sched_getparam(pid_t, struct sched_param *);
int    sched_getscheduler(pid_t);
int    sched_rr_get_interval(pid_t, struct timespec *);
int    sched_setparam(pid_t, const struct sched_param *);
int    sched_setscheduler(pid_t, int, const struct sched_param *);
int    sched_yield(void);
```

Inclusion of the **<sched.h>** header makes symbols defined in the header **<time.h>** visible.

11052 **APPLICATION USAGE**

11053 None.

11054 **RATIONALE**

11055 None.

11056 **FUTURE DIRECTIONS**

11057 None.

11058 **SEE ALSO**

11059 **<time.h>**

11060 **CHANGE HISTORY**

11061 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

11062 **Issue 6**

11063 The **<sched.h>** header is marked as part of the Process Scheduling option. |

11064 Sporadic server members are added to the **sched_param** structure, and the SCHED_SPORADIC
11065 scheduling policy is added for alignment with IEEE Std. 1003.1d-1999. |

11066 IEEE PASC Interpretation 1003.1 #108 is applied, correcting the **sched_param** structure whose |
11067 members *sched_ss_repl_period* and *sched_ss_init_budget* members should be type **struct timespec** |
11068 and not **timespec**. |

NAME

search.h — search tables

SYNOPSIS

XSI
```
#include <search.h>
```

DESCRIPTION

The **<search.h>** header shall provide a type definition, **ENTRY**, for structure **entry** which shall include the following members:

```
char    *key
void    *data
```

and shall define **ACTION** and **VISIT** as enumeration data types through type definitions as follows:

```
enum { FIND, ENTER } ACTION;
enum { preorder, postorder, endorder, leaf } VISIT;
```

The **size_t** type shall be defined as described in **<sys/types.h>**.

Each of the following shall be declared as a function, or defined as a macro, or both. Function prototypes shall be provided for use with an ISO C standard compiler.

```
int    hcreate(size_t);
void   hdestroy(void);
ENTRY *hsearch(ENTRY, ACTION);
void   insque(void *, void *);
void  *lfind(const void *, const void *, size_t *,
           size_t, int (*)(const void *, const void *));
void  *lsearch(const void *, void *, size_t *,
           size_t, int (*)(const void *, const void *));
void   remque(void *);
void  *tdelete(const void *restrict, void **restrict,
           int(*)(const void *, const void *));
void  *tfind(const void *, void *const *,
           int(*)(const void *, const void *));
void  *tsearch(const void *, void **,
           int(*)(const void *, const void *));
void   twalk(const void *,
           void (*)(const void *, VISIT, int ));
```

APPLICATION USAGE

None.

RATIONALE

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The function declarations in this header are expanded to full ISO C standard prototypes.

Reference to the **<sys/types.h>** header is added for the definition of **size_t**.

Issue 4, Version 2

For X/OPEN UNIX conformance, the *insque*( ) and *remque*( ) functions are added to the list of functions declared in this header.

Issue 6

The Open Group corrigenda item U021/6 has been applied updating the prototypes for *tdelete*( ) and *tsearch*( ).

The **restrict** keyword is added to the prototype for *tdelete*( ).

NAME

semaphore.h — semaphores (**REALTIME**)

SYNOPSIS

SEM
```
#include <semaphore.h>
```

DESCRIPTION

The **<semaphore.h>** header shall define the **sem_t** type, used in performing semaphore operations. The semaphore may be implemented using a file descriptor, in which case applications are able to open up at least a total of {OPEN_MAX} files and semaphores. The symbol SEM_FAILED shall be defined (see *sem_open*( )).

The following shall be declared as functions and may also be declared as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
int    sem_close(sem_t *);
int    sem_destroy(sem_t *);
int    sem_getvalue(sem_t *restrict, int *restrict);
int    sem_init(sem_t *, int, unsigned);
sem_t *sem_open(const char *, int, ...);
int    sem_post(sem_t *);
```
TMO
```
int    sem_timedwait(sem_t *restrict, const struct timespec *restrict);
```
```
int    sem_trywait(sem_t *);
int    sem_unlink(const char *);
int    sem_wait(sem_t *);
```

Inclusion of the **<semaphore.h>** header may make visible symbols defined in the headers **<fcntl.h>** and **<sys/types.h>**.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The **<semaphore.h>** header is marked as part of the Semaphores option. |

The Open Group corrigenda item U021/3 has been applied, adding a description of SEM_FAILED.

The *sem_timedwait*( ) function is added for alignment with IEEE Std. 1003.1d-1999. |

The **restrict** keyword is added to the prototypes for *sem_getvalue*( ) and *sem_timedwait*( ). |

NAME

setjmp.h — stack environment declarations

SYNOPSIS

```
#include <setjmp.h>
```

DESCRIPTION

CX The functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of symbols in this header.

The **<setjmp.h>** header shall contain the type definitions for array types **jmp_buf** and **sigjmp_buf**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
void   longjmp(jmp_buf, int);
void   siglongjmp(sigjmp_buf, int);
XSI void  _longjmp(jmp_buf, int);
```

Each of the following may be declared as a function, or defined as a macro, or both. Function prototypes shall be provided for use with an ISO C standard compiler.

```
int    setjmp(jmp_buf);
int    sigsetjmp(sigjmp_buf, int);
XSI int   _setjmp(jmp_buf);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 1.

Issue 4

The following changes are incorporated for alignment with the ISO C standard:

- The function declarations in this header are expanded to full ISO C standard prototypes.
- The DESCRIPTION is changed to indicate that all functions in this header can also be declared as macros.
- The arguments **jmp_buf** and **sigjmp_buf** are specified as array types.

Issue 4, Version 2

For X/OPEN UNIX conformance, the *_longjmp*( ) and *_setjmp*( ) functions are added to the list of functions declared in this header.

11209 **NAME**

11210 signal.h — signals

11211 **SYNOPSIS**

11212 `#include <signal.h>`

11213 **DESCRIPTION**

11214 CX The functionality described on this reference page extends the ISO C standard. Applications
11215 shall define the appropriate feature test macro (see the System Interfaces volume of
11216 IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of
11217 symbols in this header.

11218 The **<signal.h>** header shall define the following symbolic constants, each of which expands to a
11219 distinct constant expression of the type:

11220 `void (*)(int)`

11221 whose value matches no declarable function.

11222 SIG_DFL Request for default signal handling.

11223 SIG_ERR Return value from *signal*( ) in case of error.

11224 SIG_HOLD Request that signal be held.

11225 SIG_IGN Request that signal be ignored.

11226 The following data types shall be defined through **typedef**:

11227 **sig_atomic_t** Possibly volatile-qualified integer type of an object that can be accessed as |
11228 an atomic entity, even in the presence of asynchronous interrupts. |

11229 **sigset_t** Integer or structure type of an object used to represent sets of signals. |

11230 **pid_t** As described in **<sys/types.h>**. |

11231 RTS The **<signal.h>** header shall define the **sigevent** structure, which has at least the following
11232 members:

11233 `int`	`sigev_notify`	Notification type.
11234 `int`	`sigev_signo`	Signal number.
11235 `union sigval`	`sigev_value`	Signal value.
11236 `void(*)(union sigval)`	`sigev_notify_function`	Notification function.
11237 `(pthread_attr_t *)`	`sigev_notify_attributes`	Notification attributes.

11238 The following values of *sigev_notify* shall be defined:

11239 SIGEV_NONE No asynchronous notification is delivered when the event of interest
11240 occurs.

11241 SIGEV_SIGNAL A queued signal, with an application-defined value, is generated when
11242 the event of interest occurs.

11243 SIGEV_THREAD A notification function is called to perform notification.

11244 The **sigval** union shall be defined as:

11245 `int`	`sival_int`	Integer signal value.
11246 `void *`	`sival_ptr`	Pointer signal value.

11247 This header shall also declare the macros SIGRTMIN and SIGRTMAX, which evaluate to
11248 integral expressions and, if the Realtime Signals Extension option is supported, specify a range
11249 of signal numbers that are reserved for application use and for which the realtime signal

behavior specified in this volume of IEEE Std. 1003.1-200x is supported. The signal numbers in this range do not overlap any of the signals specified in the following table.

The range SIGRTMIN through SIGRTMAX inclusive shall include at least {RTSIG_MAX} signal numbers.

It is implementation-defined whether realtime signal behavior is supported for other signals.

This header also declares the constants that are used to refer to the signals that occur in the system. Signals defined here begin with the letters SIG. Each of the signals have distinct positive integral values. The value 0 is reserved for use as the null signal (see *kill*()). Additional implementation-defined signals may occur in the system.

The following signals shall be supported on all implementations (default actions are explained below the table):

Signal	Default Action	Description
SIGABRT	A	Process abort signal.
SIGALRM	T	Alarm clock.
SIGBUS	A	Access to an undefined portion of a memory object.
SIGCHLD	I	Child process terminated or stopped.
SIGCONT	C	Continue executing, if stopped.
SIGFPE	A	Erroneous arithmetic operation.
SIGHUP	T	Hangup.
SIGILL	A	Illegal instruction.
SIGINT	T	Terminal interrupt signal.
SIGKILL	T	Kill (cannot be caught or ignored).
SIGPIPE	T	Write on a pipe with no one to read it.
SIGQUIT	A	Terminal quit signal.
SIGSEGV	A	Invalid memory reference.
SIGSTOP	S	Stop executing (cannot be caught or ignored).
SIGTERM	T	Termination signal.
SIGTSTP	S	Terminal stop signal.
SIGTTIN	S	Background process attempting read.
SIGTTOU	S	Background process attempting write.
SIGUSR1	T	User-defined signal 1.
SIGUSR2	T	User-defined signal 2.
XSI SIGPOLL	T	Pollable event.
SIGPROF	T	Profiling timer expired.
SIGSYS	A	Bad system call.
SIGTRAP	A	Trace/breakpoint trap.
SIGURG	I	High bandwidth data is available at a socket.
XSI SIGVTALRM	T	Virtual timer expired.
SIGXCPU	A	CPU time limit exceeded.
SIGXFSZ	A	File size limit exceeded.

The default actions are as follows:

T Abnormal termination of the process. The process is terminated with all the consequences of *_exit*() except that the status made available to *wait*() and *waitpid*() indicates abnormal termination by the specified signal.

A Abnormal termination of the process.

XSI Additionally, implementation-defined abnormal termination actions, such as creation of a core file, may occur.

11298 I Ignore the signal.
11299 S Stop the process.
11300 C Continue the process, if it is stopped; otherwise, ignore the signal.

11301 The header shall provide a declaration of **struct sigaction**, including at least the following
11302 members:

```
11303 void (*sa_handler)(int)   What to do on receipt of signal.
11304 sigset_t sa_mask          Set of signals to be blocked during execution
11305                           of the signal handling function.
11306 int      sa_flags         Special flags.
11307 void (*)(int, siginfo_t *, void *) sa_sigaction
11308                           Pointer to signal handler function or one
11309                           of the macros SIG_IGN or SIG_DFL.
```

11310 XSI The storage occupied by *sa_handler* and *sa_sigaction* may overlap, and a portable program must
11311 not use both simultaneously.

11312 The following shall be declared as constants:

11313 SA_NOCLDSTOP Do not generate SIGCHLD when children stop.

11314 SIG_BLOCK The resulting set is the union of the current set and the signal set pointed
11315 to by the argument *set*.

11316 SIG_UNBLOCK The resulting set is the intersection of the current set and the complement
11317 of the signal set pointed to by the argument *set*.

11318 SIG_SETMASK The resulting set is the signal set pointed to by the argument *set*.

11319 XSI SA_ONSTACK Causes signal delivery to occur on an alternate stack.

11320 XSI SA_RESETHAND Causes signal dispositions to be set to SIG_DFL on entry to signal
11321 handlers.

11322 XSI SA_RESTART Causes certain functions to become restartable.

11323 XSI SA_SIGINFO Causes extra information to be passed to signal handlers at the time of
11324 receipt of a signal.

11325 XSI SA_NOCLDWAIT Causes implementations not to create zombie processes on child death.

11326 XSI SA_NODEFER Causes signal not to be automatically blocked on entry to signal handler.

11327 XSI SS_ONSTACK Process is executing on an alternate signal stack.

11328 XSI SS_DISABLE Alternate signal stack is disabled.

11329 XSI MINSIGSTKSZ Minimum stack size for a signal handler.

11330 XSI SIGSTKSZ Default size in bytes for the alternate signal stack.

11331 XSI The **ucontext_t** structure shall be defined through **typedef** as described in **<ucontext.h>**.

11332 The **mcontext_t** type shall be defined through **typedef** as described in **<ucontext.h>**.

11333 The **<signal.h>** header shall define the **stack_t** type as a structure that includes at least the
11334 following members:

```
11335 void     *ss_sp      Stack base or pointer.
11336 size_t    ss_size    Stack size.
11337 int       ss_flags   Flags.
```

The **<signal.h>** header shall define the **sigstack** structure that includes at least the following members:

`int`	`ss_onstack`	Non-zero when signal stack is in use.
`void *`	`ss_sp`	Signal stack pointer.

The **<signal.h>** header shall define the **siginfo_t** type as a structure that includes at least the following members:

	`int`	`si_signo`	Signal number.
XSI	`int`	`si_errno`	If non-zero, an *errno* value associated with this signal, as defined in **<errno.h>.**
	`int`	`si_code`	Signal code.
XSI	`pid_t`	`si_pid`	Sending process ID.
	`uid_t`	`si_uid`	Real user ID of sending process.
	`void *`	`si_addr`	Address of faulting instruction.
	`int`	`si_status`	Exit value or signal.
	`long`	`si_band`	Band event for SIGPOLL.
RTS	`union sigval`	`si_value`	Signal value.

The macros specified in the **Code** column of the following table are defined for use as values of *si_code* that are signal-specific or non-signal-specific reasons why the signal was generated.
XSI

Signal	Code	Reason
SIGILL	ILL_ILLOPC	Illegal opcode.
	ILL_ILLOPN	Illegal operand.
	ILL_ILLADR	Illegal addressing mode.
	ILL_ILLTRP	Illegal trap.
	ILL_PRVOPC	Privileged opcode.
	ILL_PRVREG	Privileged register.
	ILL_COPROC	Coprocessor error.
	ILL_BADSTK	Internal stack error.
SIGFPE	FPE_INTDIV	Integer divide by zero.
	FPE_INTOVF	Integer overflow.
	FPE_FLTDIV	Floating point divide by zero.
	FPE_FLTOVF	Floating point overflow.
	FPE_FLTUND	Floating point underflow.
	FPE_FLTRES	Floating point inexact result.
	FPE_FLTINV	Invalid floating point operation.
	FPE_FLTSUB	Subscript out of range.
SIGSEGV	SEGV_MAPERR	Address not mapped to object.
	SEGV_ACCERR	Invalid permissions for mapped object.
SIGBUS	BUS_ADRALN	Invalid address alignment.
	BUS_ADRERR	Non-existent physical address.
	BUS_OBJERR	Object specific hardware error.
SIGTRAP	TRAP_BRKPT	Process breakpoint.
	TRAP_TRACE	Process trace trap.
SIGCHLD	CLD_EXITED	Child has exited.
	CLD_KILLED	Child has terminated abnormally and did not create a core file.
	CLD_DUMPED	Child has terminated abnormally and created a core file.
	CLD_TRAPPED	Traced child has trapped.
	CLD_STOPPED	Child has stopped.
	CLD_CONTINUED	Stopped child has continued.
SIGPOLL	POLL_IN	Data input available.
	POLL_OUT	Output buffers available.
	POLL_MSG	Input message available.
	POLL_ERR	I/O error.
	POLL_PRI	High priority input available.
	POLL_HUP	Device disconnected.
Any	SI_USER	Signal sent by *kill*().
	SI_QUEUE	Signal sent by the *sigqueue*().
	SI_TIMER	Signal generated by expiration of a timer set by *timer_settime*().
	SI_ASYNCIO	Signal generated by completion of an asynchronous I/O request.
	SI_MESGQ	Signal generated by arrival of a message on an empty message queue.

XSI Implementations may support additional *si_code* values not included in this list, may generate values included in this list under circumstances other than those described in this list, and may contain extensions or limitations that prevent some values from being generated. Implementations do not generate a different value from the ones described in this list for circumstances described in this list.

In addition, the following signal-specific information shall be available:

Signal	Member	Value
SIGILL SIGFPE	**void * si_addr**	Address of faulting instruction.
SIGSEGV SIGBUS	**void * si_addr**	Address of faulting memory reference.
SIGCHLD	**pid_t si_pid** **int si_status** **uid_t si_uid**	Child process ID. Exit value or signal. Real user ID of the process that sent the signal.
SIGPOLL	**long si_band**	Band event for POLL_IN, POLL_OUT, or POLL_MSG.

For some implementations, the value of *si_addr* may be inaccurate.

The following shall be declared as functions and may also be defined as macros:

```
XSI  void (*bsd_signal(int, void (*)(int)))(int);
     int    kill(pid_t, int);
XSI  int    killpg(pid_t, int);
     int    pthread_kill(pthread_t, int);
     int    pthread_sigmask(int, const sigset_t *, sigset_t *);
     int    raise(int);
     int    sigaction(int, const struct sigaction *restrict,
                struct sigaction *restrict);
     int    sigaddset(sigset_t *, int);
XSI  int    sigaltstack(const stack_t *restrict, stack_t *restrict);
     int    sigdelset(sigset_t *, int);
     int    sigemptyset(sigset_t *);
     int    sigfillset(sigset_t *);
XSI  int    sighold(int);
     int    sigignore(int);
     int    siginterrupt(int, int);
     int    sigismember(const sigset_t *, int);
     void (*signal(int, void (*)(int)))(int);
XSI  int    sigpause(int);
     int    sigpending(sigset_t *);
     int    sigprocmask(int, const sigset_t *restrict, sigset_t *restrict);
RTS  int    sigqueue(pid_t, int, const union sigval);
XSI  int    sigrelse(int);
     void (*sigset(int, void (*)(int)))(int);
     int    sigstack(struct sigstack *, struct sigstack *); (LEGACY)
     int    sigsuspend(const sigset_t *);
RTS  int    sigtimedwait(const sigset_t *restrict, siginfo_t *restrict,
                const struct timespec *restrict);
     int    sigwait(const sigset_t *restrict, int *restrict);
RTS  int    sigwaitinfo(const sigset_t *restrict, siginfo_t *restrict);
```

APPLICATION USAGE

CHANGE HISTORY

First released in Issue 1.

Issue 4

A reference to **<sys/types.h>** is added for the definition of **pid_t**. This is marked as an extension.

In the list of signals starting with SIGCHLD, the statement ‘‘but a system not supporting the job control option is not obliged to support the functionality of these signals’’ is removed. This is because job control is defined as mandatory on Issue 4 conforming implementations.

Reference to implementation-defined abnormal termination routines, such as creation of a core file, in item ii in the defaults action list is marked as an extension.

The following changes are incorporated for alignment with the ISO POSIX-1 standard:

- The function declarations in this header are expanded to full ISO C standard prototypes.
- The DESCRIPTION is changed as follows:
  - — To define the type **sig_atomic_t**.
  - — To define the syntax of signal names and functions.
  - — To combine the two tables of constants.
  - — SIGFPE is no longer limited to floating-point exceptions, but covers all erroneous arithmetic operations.

The following change is incorporated for alignment with the ISO C standard:

- The *raise*( ) function is added to the list of functions declared in this header.

Issue 4, Version 2

The following changes are incorporated for X/OPEN UNIX conformance:

- The SIGTRAP, SIGBUS, SIGSYS, SIGPOLL, SIGPROF, SIGXCPU, SIGXFSZ, SIGURG, and SIGVTALRM signals are added to the list of signals that are supported on all conforming implementations.
- The *sa_sigaction* member is added to the **sigaction** structure, and a note is added that the storage used by *sa_handler* and *sa_sigaction* may overlap.
- The SA_ONSTACK, SA_RESETHAND, SA_RESTART, SA_SIGINFO, SA_NOCLDWAIT, SS_ONSTACK, SS_DISABLE, MINSIGSTKSZ, and SIGSTKSZ constants are defined. The **stack_t**, **sigstack**, and **siginfo** structures are defined.
- Definitions are given for the **ucontext_t**, **stack_t**, **sigstack**, and **siginfo_t** types.

- A table is provided listing macros that are defined as signal-specific reasons why a signal was generated. Signal-specific additional information is specified.
- The *bsd_signal*( ), *killpg*( ), *_longjmp*( ), *_setjmp*( ), *sigaltstack*( ), *sighold*( ), *sigignore*( ), *siginterrupt*( ), *sigpause*( ), *sigrelse*( ), *sigset*( ), and *sigstack*( ) functions are added to the list of functions declared in this header.

Issue 5

The DESCRIPTION is updated for alignment with POSIX Realtime Extension and the POSIX Threads Extension.

The default action for SIGURG is changed for i to iii. The function prototype for *sigmask*( ) is removed.

Issue 6

The Open Group corrigenda item U035/2 has been applied. In the DESCRIPTION, the wording for abnormal termination is clarified.

The Open Group corrigenda item U028/8 has been applied, correcting the prototype for the *sigset*( ) function.

The Open Group corrigenda item U026/3 has been applied, correcting the type of the *sigev_notify_function* function member of the **sigevent** structure.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The SIGCHLD, SIGCONT, SIGSTOP, SIGTSTP, SIGTTIN, and SIGTTOU signals are now mandated. This is also a FIPS requirement.
- The **pid_t** definition is mandated.

The RT markings are now changed to RTS to denote that the semantics are part of the Realtime Signals Extension option.

The **restrict** keyword is added to the prototypes for *sigaction*( ), *sigaltstack*( ), *sigprocmask*( ), *sigtimedwait*( ), *sigwait*( ), and *sigwaitinfo*( ).

NAME

spawn.h — spawn (**REALTIME**)

SYNOPSIS

SPN
```
#include <spawn.h>
```

DESCRIPTION

The **<spawn.h>** header shall define the **posix_spawnattr_t** and **posix_spawn_file_actions_t** types used in performing spawn operations.

The **<spawn.h>** header shall define the flags that may be set in a **posix_spawnattr_t** object using the *posix_spawnattr_setflags*( ) function:

POSIX_SPAWN_RESETIDS
POSIX_SPAWN_SETPGROUP
PS POSIX_SPAWN_SETSCHEDPARAM
POSIX_SPAWN_SETSCHEDULER
POSIX_SPAWN_SETSIGDEF
POSIX_SPAWN_SETSIGMASK

The following shall be declared as functions and may also be declared as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
int   posix_spawn(pid_t *restrict, const char *restrict,
          const posix_spawn_file_actions_t *,
          const posix_spawnattr_t *restrict, char *const [restrict],
          char *const [restrict]);
int   posix_spawn_file_actions_addclose(posix_spawn_file_actions_t *,
          int);
int   posix_spawn_file_actions_adddup2(posix_spawn_file_actions_t *,
          int, int);
int   posix_spawn_file_actions_addopen(posix_spawn_file_actions_t *restrict,
          int, const char *restrict, int, mode_t);
int   posix_spawn_file_actions_destroy(posix_spawn_file_actions_t *);
int   posix_spawn_file_actions_init(posix_spawn_file_actions_t *);
int   posix_spawnattr_destroy(posix_spawnattr_t *);
int   posix_spawnattr_getsigdefault(const posix_spawnattr_t *restrict,
          sigset_t *restrict);
int   posix_spawnattr_getflags(const posix_spawnattr_t *restrict,
          short *restrict);
int   posix_spawnattr_getpgroup(const posix_spawnattr_t *restrict,
          pid_t *restrict);
PS int   posix_spawnattr_getschedparam(const posix_spawnattr_t *restrict,
          struct sched_param *restrict);
int   posix_spawnattr_getschedpolicy(const posix_spawnattr_t *restrict,
          int *restrict);
int   posix_spawnattr_getsigmask(const posix_spawnattr_t *restrict,
          sigset_t *restrict);
int   posix_spawnattr_init(posix_spawnattr_t *);
int   posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict,
          const sigset_t *restrict);
int   posix_spawnattr_setflags(posix_spawnattr_t *, short);
int   posix_spawnattr_setpgroup(posix_spawnattr_t *, pid_t);
```
PS

```
int   posix_spawnattr_setschedparam(posix_spawnattr_t *restrict,
          const struct sched_param *restrict);
int   posix_spawnattr_setschedpolicy(posix_spawnattr_t *, int);
int   posix_spawnattr_setsigmask(posix_spawnattr_t *restrict,
          const sigset_t *restrict);
const posix_spawnattr_t *, char *const [], char *const []);
int   posix_spawnp(pid_t *restrict, const char *restrict,
          const posix_spawn_file_actions_t *,
          const posix_spawnattr_t *restrict,
          char *const [restrict], char *const [restrict]);
```

Inclusion of the **<spawn.h>** header may make visible symbols defined in the **<sched.h>**, **<signal.h>**, and **<sys/types.h>** headers.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

#include <stdarg.h>
```

11606
```
void va_start(va_list ap, argN);
```
11607
```
void va_copy(va_list dest, va_list src);
```
11608
```
type va_arg(va_list ap, type);
```
11609
```
void va_end(va_list ap);
```

11610 **DESCRIPTION**

11611 CX The functionality described on this reference page extends the ISO C standard. Applications
11612 shall define the appropriate feature test macro (see the System Interfaces volume of
11613 IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of
11614 symbols in this header.

11615 The **<stdarg.h>** header contains a set of macros which allows portable functions that accept
11616 variable argument lists to be written. Functions that have variable argument lists (such as
11617 *printf*( )) but do not use these macros, are inherently non-portable, as different systems use
11618 different argument-passing conventions.

11619 The type **va_list** is defined for variables used to traverse the list.

11620 The *va_start*( ) macro is invoked to initialize *ap* to the beginning of the list before any calls to
11621 *va_arg*( ).

11622 The *va_copy*( ) macro initializes as a copy of *src*, as if the *va_start*( ) macro had been applied to
11623 *dest* followed by the same sequence of uses of the *va_arg*( ) macro as had previously been used to
11624 reach the present state of *src*. Neither the *va_copy*( ) nor *va_start*( ) macro shall be invoked to
11625 reinitialize *dest* without an intervening invocation of the *va_end*( ) macro for the same *dest*.

11626 The object *ap* may be passed as an argument to another function; if that function invokes the
11627 *va_arg*( ) macro with parameter *ap*, the value of *ap* in the calling function is indeterminate and
11628 must be passed to the *va_end*( ) macro prior to any further reference to *ap*. The parameter *argN* is
11629 the identifier of the rightmost parameter in the variable parameter list in the function definition
11630 (the one just before the ...). If the parameter *argN* is declared with the **register** storage class, with
11631 a function type or array type, or with a type that is not compatible with the type that results after
11632 application of the default argument promotions, the behavior is undefined.

11633 The *va_arg*( ) macro returns the next argument in the list pointed to by *ap*. Each invocation of
11634 *va_arg*( ) modifies *ap* so that the values of successive arguments are returned in turn. The *type*
11635 parameter is the type the argument is expected to be. This is the type name specified such that
11636 the type of a pointer to an object that has the specified type can be obtained simply by suffixing
11637 a '*' to type. Different types can be mixed, but it is up to the routine to know what type of
11638 argument is expected.

11639 The *va_end*( ) macro is used to clean up; it invalidates *ap* for use (unless *va_start*( ) or *va_copy*( ) is
11640 invoked again).

11641 Each invocation of the *va_start*( ) and *va_copy*( ) macros shall be matched by a corresponding
11642 invocation of the *va_end*( ) macro in the same function.

11643 Multiple traversals, each bracketed by *va_start*( ) ... *va_end*( ), are possible.

EXAMPLES

This example is a possible implementation of *execl*( ):

```
#include <stdarg.h>

#define  MAXARGS     31

/*
 * execl is called by
 * execl(file, arg1, arg2, ..., (char *)(0));
 */
int execl(const char *file, const char *args, ...)
{
    va_list ap;
    char *array[MAXARGS];
    int argno = 0;
        va_start(ap, args);
    while (args != 0) {
        array[argno++] = args;
        args = va_arg(ap, const char *);
}
va_end(ap);
return execv(file, array);
}
```

APPLICATION USAGE

It is up to the calling routine to communicate to the called routine how many arguments there are, since it is not always possible for the called routine to determine this in any other way. For example, *execl*( ) is passed a null pointer to signal the end of the list. The *printf*( ) function can tell how many arguments are there by the *format* argument.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

stdbool.h — boolean type and values

SYNOPSIS

```
#include <stdbool.h>
```

DESCRIPTION

CX The functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of symbols in this header.

The **<stdbool.h>** header shall define the following macros:

bool Expands to *_Bool*.

true Expands to the integer constant 1.

false Expands to the integer constant 0.

__bool_true_false_are_defined
Expands to the integer constant 1.

An application may undefine and then possibly redefine the macros *bool*, *true*, and *false*.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The ability to undefine and redefine the macros *bool*, *true*, and *false* is an obsolescent feature and may be withdrawn in the future.

SEE ALSO

None.

CHANGE HISTORY

First released in Issue 6. Included for alignment with the ISO / IEC 9899: 1999 standard.

NAME

stddef.h — standard type definitions

SYNOPSIS

```
#include <stddef.h>
```

DESCRIPTION

CX The functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of symbols in this header.

The **<stddef.h>** header shall define the following:

NULL Null pointer constant.

offsetof(*type*, *member-designator*)
Integral constant expression of type **size_t**, the value of which is the offset in bytes to the structure member (*member-designator*), from the beginning of its structure (*type*).

The **<stddef.h>** header shall define through **typedef**:

ptrdiff_t Signed integer type of the result of subtracting two pointers.

wchar_t Integer type whose range of values can represent distinct wide-character codes for all members of the largest character set specified among the locales supported by the compilation environment: the null character has the code value 0 and each member of the Portable Character Set has a code value equal to its value when used as the lone character in an integer character constant.

size_t Unsigned integer type of the result of the *sizeof* operator.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

11738 **NAME**

11739 stdint.h — integer types

11740 **SYNOPSIS**

11741 `#include <stdint.h>`

11742 **DESCRIPTION**

11743 CX The functionality described on this reference page extends the ISO C standard. Applications
11744 shall define the appropriate feature test macro (see the System Interfaces volume of
11745 IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of
11746 symbols in this header.

11747 The **<stdint.h>** header declares sets of integer types having specified widths, and defines
11748 corresponding sets of macros. It also defines macros that specify limits of integer types
11749 corresponding to types defined in other standard headers.

11750 Types are defined in the following categories:

11751 • Integer types having certain exact widths

11752 • Integer types having at least certain specified widths

11753 • Fastest integer types having at least certain specified widths

11754 • Integer types wide enough to hold pointers to objects

11755 • Integer types having greatest width

11756 (Some of these types may denote the same type.)

11757 Corresponding macros specify limits of the declared types and construct suitable constants.

11758 For each type described herein that the implementation provides, the **<stdint.h>** header shall
11759 declare that **typedef** name and define the associated macros. Conversely, for each type described
11760 herein that the implementation does not provide, the **<stdint.h>** header shall not declare that
11761 **typedef** name, nor shall it define the associated macros. An implementation shall provide those
11762 types described as required, but need not provide any of the others (described as optional).

11763 **Integer Types**

11764 When **typedef** names differing only in the absence or presence of the initial *u* are defined, they
11765 shall denote corresponding signed and unsigned types as described in the ISO/IEC 9899:1999
11766 standard, Section 6.2.5; an implementation providing one of these corresponding types shall also
11767 provide the other.

11768 In the following descriptions, the symbol *N* represents an unsigned decimal integer with no
11769 leading zeros (for example, 8 or 24, but not 04 or 048).

11770 • Exact-width integer types

11771 The **typedef** name **int***N***_t** designates a signed integer type with width *N*, no padding bits,
11772 and a two's-complement representation. Thus, **int8_t** denotes a signed integer type with a
11773 width of exactly 8 bits.

11774 The **typedef** name **uint***N***_t** designates an unsigned integer type with width *N*. Thus,
11775 **uint24_t** denotes an unsigned integer type with a width of exactly 24 bits.

11776 These types are optional. However, if an implementation provides integer types with widths
11777 of 8, 16, 32, or 64 bits, it shall define the corresponding **typedef** names.

11778 • Minimum-width integer types

The **typedef** name **int_least***N***_t** designates a signed integer type with a width of at least *N*, such that no signed integer type with lesser size has at least the specified width. Thus, **int_least32_t** denotes a signed integer type with a width of at least 32 bits.

The **typedef** name **uint_least***N***_t** designates an unsigned integer type with a width of at least *N*, such that no unsigned integer type with lesser size has at least the specified width. Thus, **uint_least16_t** denotes an unsigned integer type with a width of at least 16 bits.

The following types are required:

int_least8_t
int_least16_t
int_least32_t
int_least64_t
uint_least8_t
uint_least16_t
uint_least32_t
uint_least64_t

All other types of this form are optional.

- Fastest minimum-width integer types

Each of the following types designates an integer type that is usually fastest to operate with among all integer types that have at least the specified width.

The designated type is not guaranteed to be fastest for all purposes; if the implementation has no clear grounds for choosing one type over another, it will simply pick some integer type satisfying the signedness and width requirements.

The **typedef** name **int_fast***N***_t** designates the fastest signed integer type with a width of at least *N*. The **typedef** name **uint_fast***N***_t** designates the fastest unsigned integer type with a width of at least *N*.

The following types are required:

int_fast8_t
int_fast16_t
int_fast32_t
int_fast64_t
uint_fast8_t
uint_fast16_t
uint_fast32_t
uint_fast64_t

All other types of this form are optional.

- Integer types capable of holding object pointers

The following type designates a signed integer type with the property that any valid pointer to **void** can be converted to this type, then converted back to a pointer to **void**, and the result will compare equal to the original pointer:

intptr_t

The following type designates an unsigned integer type with the property that any valid pointer to **void** can be converted to this type, then converted back to a pointer to **void**, and the result will compare equal to the original pointer:

uintptr_t

These types are optional.

- Greatest-width integer types

The following type designates a signed integer type capable of representing any value of any signed integer type:

intmax_t

The following type designates an unsigned integer type capable of representing any value of any unsigned integer type:

uintmax_t

These types are required.

Limits of Specified-Width Integer Types

The following object-like macros specify the minimum and maximum limits of the types declared in the **<stdint.h>** header. Each macro name corresponds to a similar type name in **Integer Types** (on page 352).

Each instance of any defined macro shall be replaced by a constant expression suitable for use in #if preprocessing directives, and this expression shall have the same type as would an expression that is an object of the corresponding type converted according to the integer promotions. Its implementation-defined value shall be equal to or greater in magnitude (absolute value) than the corresponding value given below, with the same sign, except where stated to be exactly the given value.

- Limits of exact-width integer types
  - — Minimum values of exact-width signed integer types:

    {INT*N*_MIN} Exactly $-(2^{N-1})$
  - — Maximum values of exact-width signed integer types:

    {INT*N*_MAX} Exactly $2^{N-1}-1$
  - — Maximum values of exact-width unsigned integer types:

    {UINT*N*_MAX} Exactly $2^{N}-1$
- Limits of minimum-width integer types
  - — Minimum values of minimum-width signed integer types:

    {INT_LEAST*N*_MIN} $-(2^{N-1}-1)$
  - — Maximum values of minimum-width signed integer types:

    {INT_LEAST*N*_MAX} $2^{N}-1$
  - — Maximum values of minimum-width unsigned integer types:

    {UINT_LEAST*N*_MAX} $2^{N}-1$
- Limits of fastest minimum-width integer types
  - — Minimum values of fastest minimum-width signed integer types:

    {INT_FAST*N*_MIN} $-(2^{N-1}-1)$

— Maximum values of fastest minimum-width signed integer types:

{INT_FAST*N*_MAX} $2^{N-1} - 1$

— Maximum values of fastest minimum-width unsigned integer types:

{UINT_FAST*N*_MAX} $2^{N} - 1$

- Limits of integer types capable of holding object pointers

— Minimum value of pointer-holding signed integer type:

{INTPTR_MIN} $-(2^{15} - 1)$

— Maximum value of pointer-holding signed integer type:

{INTPTR_MAX} $2^{15} - 1$

— Maximum value of pointer-holding unsigned integer type:

{UINTPTR_MAX} $2^{16} - 1$

- Limits of greatest-width integer types

— Minimum value of greatest-width signed integer type:

{INTMAX_MIN} $-(2^{63} - 1)$

— Maximum value of greatest-width signed integer type:

{INTMAX_MAX} $2^{63} - 1$

— Maximum value of greatest-width unsigned integer type:

{UINTMAX_MAX} $2^{64} - 1$

Limits of Other Integer Types

The following object-like macros specify the minimum and maximum limits of integer types corresponding to types defined in other standard headers.

Each instance of these macros shall be replaced by a constant expression suitable for use in #if preprocessing directives, and this expression shall have the same type as would an expression that is an object of the corresponding type converted according to the integer promotions. Its implementation-defined value shall be equal to or greater in magnitude (absolute value) than the corresponding value given below, with the same sign.

- Limits of **ptrdiff_t**:

{PTRDIFF_MIN} –65535

{PTRDIFF_MAX} +65535

- Limits of **sig_atomic_t**:

{SIG_ATOMIC_MIN} See below.

{SIG_ATOMIC_MAX} See below.

- Limit of **size_t**:

{SIZE_MAX} 65535

- Limits of **wchar_t**:

{WCHAR_MIN} See below.

{WCHAR_MAX}	See below.

- Limits of **wint_t**:

{WINT_MIN}	See below.
[WINT_MAX}	See below.

If **sig_atomic_t** (see the **<signal.h>** header) is defined as a signed integer type, the value of {SIG_ATOMIC_MIN} shall be no greater than –127 and the value of {SIG_ATOMIC_MAX} shall be no less than 127; otherwise, **sig_atomic_t** is defined as an unsigned integer type, and the value of {SIG_ATOMIC_MIN} shall be 0 and the value of {SIG_ATOMIC_MAX} shall be no less than 255.

If **wchar_t** (see the **<stddef.h>** header) is defined as a signed integer type, the value of {WCHAR_MIN} shall be no greater than –127 and the value of {WCHAR_MAX} shall be no less than 127; otherwise, **wchar_t** is defined as an unsigned integer type, and the value of {WCHAR_MIN} shall be 0 and the value of {WCHAR_MAX} shall be no less than 255.

If **wint_t** (see the **<wchar.h>** header) is defined as a signed integer type, the value of {WINT_MIN} shall be no greater than –32767 and the value of {WINT_MAX} shall be no less than 32767; otherwise, **wint_t** is defined as an unsigned integer type, and the value of {WINT_MIN} shall be 0 and the value of {WINT_MAX} shall be no less than 65535.

Macros for Integer Constants

The following function-like macros expand to integer constants suitable for initializing objects that have integer types corresponding to types defined in the **<stdint.h>** header. Each macro name corresponds to a similar type name listed under *Minimum-width integer types* and *Greatest-width integer types*.

The argument in any instance of these macros shall be a decimal, octal, or hexadecimal constant with a value that does not exceed the limits for the corresponding type.

- Macros for minimum-width integer constants

  Each of the following macros expands to an integer constant having the value specified by its argument and a type with at least the specified width.

  The macro *INTN_C*(*value*) shall expand to a signed integer constant with the specified value and type **int_least***N***_t**. The macro *UINTN_C*(*value*) shall expand to an unsigned integer constant with the specified value and type **uint_least***N***_t**. For example, if **uint_least64_t** is a name for the type **unsigned long long**, then *UINT64_C*(0x123) might expand to the integer constant 0x123ULL.

- Macros for greatest-width integer constants

  The following macro expands to an integer constant having the value specified by its argument and the type **intmax_t**:

  INTMAX_C(*value*)

  The following macro expands to an integer constant having the value specified by its argument and the type **uintmax_t**:

  UINTMAX_C(*value*)

APPLICATION USAGE

None.

RATIONALE

The **<stdint.h>** header is a subset of the **<inttypes.h>** header more suitable for use in freestanding environments, which might not support the formatted I/O functions. In some environments, if the formatted conversion support is not wanted, using this header instead of the **<inttypes.h>** header avoids defining such a large number of macros.

FUTURE DIRECTIONS

typedef names beginning with **int** or **uint** and ending with _t may be added to the types defined in the **<stdint.h>** header. Macro names beginning with INT or UINT and ending with _MAX, _MIN, or _C may be added to the macros defined in the **<stdint.h>** header.

SEE ALSO

<signal.h>, **<stddef.h>**, **<wchar.h>**, **<inttypes.h>**

CHANGE HISTORY

First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

11949 **NAME**

11950 stdio.h — standard buffered input/output

11951 **SYNOPSIS**

11952 `#include <stdio.h>`

11953 **DESCRIPTION**

11954 CX The functionality described on this reference page extends the ISO C standard. Applications
11955 shall define the appropriate feature test macro (see the System Interfaces volume of
11956 IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of
11957 symbols in this header.

11958 The **<stdio.h>** header shall define the following macro names as positive integral constant
11959 expressions:

11960	{BUFSIZ}	Size of **<stdio.h>** buffers.
11961 11962	{FILENAME_MAX}	Maximum size in bytes of the longest file name string that the implementation guarantees can be opened.
11963 11964	{FOPEN_MAX}	Number of streams which the implementation guarantees can be open simultaneously. The value is at least eight.
11965	{_IOFBF}	Input/output fully buffered.
11966	{_IOLBF}	Input/output line buffered.
11967	{_IONBF}	Input/output unbuffered.
11968	{L_ctermid}	Maximum size of character array to hold *ctermid*( ) output.
11969	{L_tmpnam}	Maximum size of character array to hold *tmpnam*( ) output.
11970	{SEEK_CUR}	Seek relative to current position.
11971	{SEEK_END}	Seek relative to end-of-file.
11972	{SEEK_SET}	Seek relative to start-of-file.
11973 11974 XSI 11975	{TMP_MAX}	Minimum number of unique file names generated by *tmpnam*( ). Maximum number of times an application can call *tmpnam*( ) reliably. The value of {TMP_MAX} is at least 10,000.

11976 The following macro name shall be defined as a negative integral constant expression:

11977	EOF	End-of-file return value.

11978 The following macro name shall be defined as a null pointer constant:

11979	NULL	Null pointer.

11980 The following macro name shall be defined as a string constant:

11981 XSI	P_tmpdir	Default directory prefix for *tempnam*( ).

11982 The following macro names shall be defined as expressions of type pointer to FILE:

11983	*stderr*	Standard error output stream.
11984	*stdin*	Standard input stream.
11985	*stdout*	Standard output stream.

11986 The following data types shall be defined through **typedef**:

FILE A structure containing information about a file.

fpos_t Type containing all information needed to specify uniquely every position within a file.

XSI **va_list** As described in **<stdarg.h>**.

size_t As described in **<stddef.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
void     clearerr(FILE *);
char    *ctermid(char *);
int      fclose(FILE *);
FILE    *fdopen(int, const char *);
int      feof(FILE *);

int      putchar_unlocked(int);
int      puts(const char *);
int      remove(const char *);
```

```
12037          int      rename(const char *, const char *);
12038          void     rewind(FILE *);
12039          int      scanf(const char *restrict, ...);
12040          void     setbuf(FILE *restrict, char *restrict);
12041          int      setvbuf(FILE *restrict, char *restrict, int, size_t);
12042 XSI      int      snprintf(char *restrict, size_t, const char *restrict, ...);
12043          int      sprintf(char *restrict, const char *restrict, ...);
12044          int      sscanf(const char *restrict, const char *restrict, int ...);
12045 XSI      char    *tempnam(const char *, const char *);
12046          FILE    *tmpfile(void);
12047          char    *tmpnam(char *);
12048          int      ungetc(int, FILE *);
12049          int      vfprintf(FILE *restrict, const char *restrict, va_list);
12050          int      vfscanf(FILE *restrict, const char *restrict, va_list);
12051          int      vprintf(const char *restrict, va_list);
12052          int      vscanf(const char *restrict, va_list);
12053 XSI      int      vsnprintf(char *restrict, size_t, const char *restrict, va_list;
12054          int      vsprintf(char *restrict, const char *restrict, va_list);
12055          int      vsscanf(const char *restrict, const char *restrict, va_list arg);
```

12056 XSI Inclusion of the **<stdio.h>** header may also make visible all symbols from **<stddef.h>**.

12057 **APPLICATION USAGE**

12058 None.

12059 **RATIONALE**

12060 None.

12061 **FUTURE DIRECTIONS**

12070 **CHANGE HISTORY**

12071 First released in Issue 1. Derived from Issue 1 of the SVID. |

12072 **Issue 4**

12073 The constant {L_cuserid} and the external variables *optarg*, *opterr*, *optind*, and *optopt* are marked |
12074 as extensions and TO BE WITHDRAWN.

12075 The minimum allowable value of {TMP_MAX}, 10,000 on XSI-conformant systems, has been
12076 marked as an extension.

12077 The P_tmpdir constant is moved from the APPLICATION USAGE section to the DESCRIPTION
12078 and marked as an extension. The remainder of the APPLICATION USAGE section is removed.

12079 References to the **va_list** and **size_t** types are added to the DESCRIPTION.

12080 Function declarations of the *cuserid*( ), *getopt*( ), and *tempnam*( ) functions and the **va_list** type are
12081 marked as extensions.

The *cuserid*( ) and *getopt*( ) functions are marked TO BE WITHDRAWN.

A warning is added indicating that inclusion of **<stdio.h>** may also make visible all symbols from **<stddef.h>**.

The following changes are incorporated for alignment with the ISO C standard:

- The function declarations in this header are expanded to full ISO C standard prototypes.
- The DESCRIPTION is restructured to group lists of macro names according to how they are defined by an implementation (for example, whether they are integral constant expressions, pointer constants, or string constants).
- The constant {FILENAME_MAX} is added to the list of integral constant expressions. The text of {FOPEN_MAX} has also been changed for consistency with the ISO C standard.
- The data type **fpos_t** is moved from the APPLICATION USAGE section to the DESCRIPTION.
- The *fgetpos*( ) and *fsetpos*( ) functions are added to the list of functions declared in this header.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Large File System extensions are added.

The constant {L_cuserid} and the external variables *optarg*, *opterr*, *optind*, and *optopt* are marked as extensions and LEGACY.

The *cuserid*( ) and *getopt*( ) functions are marked LEGACY.

Issue 6

The constant {L_cuserid} and the external variables *optarg*, *opterr*, *optind*, and *optopt* are removed as they were previously marked LEGACY.

The *cuserid*( ) and *getopt*( ) functions are removed as they were previously marked LEGACY.

Several functions are marked as part of the _POSIX_THREAD_SAFE_FUNCTIONS option.

This reference page is updated to align with the ISO / IEC 9899: 1999 standard.

12107 **NAME**

12108 stdlib.h — standard library definitions

12109 **SYNOPSIS**

12110 `#include <stdlib.h>`

12111 **DESCRIPTION**

12112 CX The functionality described on this reference page extends the ISO C standard. Applications
12113 shall define the appropriate feature test macro (see the System Interfaces volume of
12114 IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of
12115 symbols in this header.

12116 The **<stdlib.h>** header shall define the following macro names:

12117 EXIT_FAILURE Unsuccessful termination for *exit*( ); evaluates to a non-zero value.

12118 EXIT_SUCCESS Successful termination for *exit*( ); evaluates to 0.

12119 NULL Null pointer.

12120 {RAND_MAX} Maximum value returned by *rand*( ); at least 32,767.

12121 {MB_CUR_MAX} Integer expression whose value is the maximum number of bytes in a
12122 character specified by the current locale.

12123 The following data types shall be defined through **typedef**:

12124 **div_t** Structure type returned by the *div*( ) function.

12125 **ldiv_t** Structure type returned by the *ldiv*( ) function.

12126 **lldiv_t** Structure type returned by the *lldiv*( ) function.

12127 **size_t** As described in **<stddef.h>**.

12128 **wchar_t** As described in **<stddef.h>**.

12129 In addition, the following symbolic names and macros shall be defined as in **<sys/wait.h>**, for
12130 use in decoding the return value from *system*( ):

12131 XSI WNOHANG
12132 WUNTRACED
12133 WEXITSTATUS
12134 WIFEXITED
12135 WIFSIGNALED
12136 WIFSTOPPED
12137 WSTOPSIG
12138 WTERMSIG
12139

12140 The following shall be declared as functions and may also be defined as macros. Function
12141 prototypes shall be provided for use with an ISO C standard compiler.

```
12142 void        _Exit(int);
12143 XSI long    a64l(const char *);
12144 void        abort(void);
12145 int         abs(int);
12146 int         atexit(void (*)(void));
12147 double      atof(const char *);
12148 int         atoi(const char *);
12149 long        atol(const char *);
```

```
12150          long long     atoll(const char *);
12151          void         *bsearch(const void *, const void *, size_t, size_t,
12152                            int (*)(const void *, const void *));
12153          void         *calloc(size_t, size_t);
12154          div_t         div(int, int);
12155 XSI      double        drand48(void);
12156          char         *ecvt(double, int, int *restrict, int *restrict); (LEGACY)
12157          double        erand48(unsigned short[3]);
12158          void          exit(int);
12159 XSI      char         *fcvt(double, int, int *restrict, int *restrict); (LEGACY)
12160          void          free(void *);
12161 XSI      char         *gcvt(double, int, char *); (LEGACY)
12162          char         *getenv(const char *);
12163 XSI      int           getsubopt(char **, char *const *, char **);
12164          int           grantpt(int);
12165          char         *initstate(unsigned, char *, size_t);
12166          long          jrand48(unsigned short[3]);
12167          char         *l64a(long);
12168          long          labs(long);
12169 XSI      void          lcong48(unsigned short[7]);
12170          ldiv_t        ldiv(long, long);
12171          long long     llabs(long long);
12172 XSI      long          lrand48(void);
12173          void         *malloc(size_t);
12174          int           mblen(const char *, size_t);
12175          size_t        mbstowcs(wchar_t *restrict, const char *restrict, size_t);
12176          int           mbtowc(wchar_t *restrict, const char *restrict, size_t);
12177 XSI      char         *mktemp(char *); (LEGACY)
12178          int           mkstemp(char *);
12179          long          mrand48(void);
12180          long          nrand48(unsigned short[3]);
12181 ADV      int           posix_memalign(void **, size_t, size_t);
12182 XSI      char         *ptsname(int);
12183          int           putenv(char *);
12184          void          qsort(void *, size_t, size_t, int (*)(const void *,
12185                            const void *));
12186          int           rand(void);
12187 TSF      int           rand_r(unsigned *);
12188 XSI      long          random(void);
12189          void         *realloc(void *, size_t);
12190 XSI      char         *realpath(const char *restrict, char *restrict);
12191          unsigned short seed48(unsigned short[3]);
12192          int           setenv(const char *, const char *, int);
12193          void          setkey(const char *);
12194          char         *setstate(const char *);
12195          void          srand(unsigned);
12196 XSI      void          srand48(long);
12197          void          srandom(unsigned);
12198          double        strtod(const char *restrict, char **restrict);
12199          float         strtof(const char *restrict, char **restrict);
12200          long          strtol(const char *restrict, char **restrict, int);
12201          long double   strtold(const char *restrict, char **restrict);
```

```
12202       long long     strtoll(const char *restrict, char **restrict, int);
12203       unsigned long strtoul(const char *restrict, char **restrict, int);
12204       long long     strtoull(const char *restrict, char **restrict, int);
12205       int           system(const char *);
12206 XSI   int           unlockpt(int);
12207       int           unsetenv(const char *);
12208       size_t        wcstombs(char *restrict, const wchar_t *restrict, size_t);
12209       int           wctomb(char *, wchar_t);
```

12210 XSI Inclusion of the **<stdlib.h>** header may also make visible all symbols from **<stddef.h>**,
12211 **<limits.h>**, **<math.h>**, and **<sys/wait.h>**.

12226 **CHANGE HISTORY**

12227 First released in Issue 3.

12228 **Issue 4**

12229 A reference is added to **<stddef.h>** and **<wchar.h>** for the definition of **size_t**.

12230 A reference is added to **<sys/wait.h>** for definitions of the symbolic names and macros defined
12231 for decoding the return value from the *system*( ) function. This reference and the symbolic names
12232 and macros are marked as an extension.

12233 The names *drand48*( ), *erand48*( ), *jrand48*( ), *lcong48*( ), *lrand48*( ), *mrand48*( ), *nrand48*( ), *putenv*( ),
12234 *seed48*( ), *setkey*( ), and *srand48*( ) are added to the list of functions declared in this header and
12235 marked as extensions.

12236 A warning is added indicating that inclusion of **<stdlib.h>** may also make visible all symbols
12237 from **<stddef.h>**, **<limits.h>**, **<math.h>**, and **<sys/wait.h>**.

12238 The APPLICATION USAGE section is removed.

12239 The following changes are incorporated for alignment with the ISO C standard:

12240 - The function declarations in this header are expanded to full ISO C standard prototypes.

12241 - The maximum value of {RAND_MAX} is defined.

12242 - The name {MB_CUR_MAX} is added to the list of macro names defined in this header, while
12243 **div_t** and **ldiv_t** are added to the list of defined types.

12244 - The names *atexit*( ), *div*( ), *labs*( ), *ldiv*( ), *mblen*( ), *mbstowcs*( ), *mbtowc*( ), *strtoul*( ), *wcstombs*( ),
12245 and *wctomb*( ) are added to the list of functions declared in this header.

Issue 4, Version 2

For X/OPEN UNIX conformance, the *a64l*(), *ecvt*(), *fcvt*(), *gcvt*(), *getsubopt*(), *grantpt*(), *initstate*(), *l64a*(), *mktemp*(), *mkstemp*(), *ptsname*(), *random*(), *realpath*(), *setstate*(), *srandom*(), *ttyslot*(), *unlockpt*(), and *valloc*() functions are added to the list of functions declared in this header.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

The *ttyslot*() and *valloc*() functions are marked LEGACY.

The type of the third argument to *initstate*() is changed from **int** to **size_t**. The type of the return value from *setstate*() is changed from **char** to **char***, and the type of the first argument is changed from **char*** to **const char***.

Issue 6

The Open Group corrigenda item U021/1 has been applied, correcting the prototype for *realpath*() to be consistent with the reference page.

The Open Group corrigenda item U028/13 has been applied, correcting the prototype for *putenv*() to be consistent with the reference page.

The *rand_r*() function is marked as part of the _POSIX_THREAD_SAFE_FUNCTIONS option.

Function prototypes for *setenv*() and *unsetenv*() are added.

The *posix_memalign*() function is added for alignment with IEEE Std. 1003.1d-1999. |

This reference page is updated to align with the ISO/IEC 9899:1999 standard. |

The *ecvt*(), *fcvt*(), *gcvt*(), and *mktemp*() functions are marked LEGACY. |

12267 **NAME**

12268 string.h — string operations

12269 **SYNOPSIS**

12270
```
#include <string.h>
```

12271 **DESCRIPTION**

12272 CX The functionality described on this reference page extends the ISO C standard. Applications
12273 shall define the appropriate feature test macro (see the System Interfaces volume of
12274 IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of
12275 symbols in this header.

12276 The **<string.h>** header shall define the following:

12277 NULL Null pointer constant.

12278 **size_t** As described in **<stddef.h>**.

12279 The following shall be declared as functions and may also be defined as macros. Function
12280 prototypes shall be provided for use with an ISO C standard compiler.

```
12281 XSI  void    *memccpy(void *restrict, const void *restrict, int, size_t);
12282      void    *memchr(const void *, int, size_t);
12283      int      memcmp(const void *, const void *, size_t);
12284      void    *memcpy(void *restrict, const void *restrict, size_t);
12285      void    *memmove(void *, const void *, size_t);
12286      void    *memset(void *, int, size_t);
12287      char    *strcat(char *restrict, const char *restrict);
12288      char    *strchr(const char *, int);
12289      int      strcmp(const char *, const char *);
12290      int      strcoll(const char *, const char *);
12291      char    *strcpy(char *restrict, const char *restrict);
12292      size_t   strcspn(const char *, const char *);
12293 XSI  char    *strdup(const char *);
12294      char    *strerror(int);
12295      size_t   strlen(const char *);
12296      char    *strncat(char *restrict, const char *restrict, size_t);
12297      int      strncmp(const char *, const char *, size_t);
12298      char    *strncpy(char *restrict, const char *restrict, size_t);
12299      char    *strpbrk(const char *, const char *);
12300      char    *strrchr(const char *, int);
12301      size_t   strspn(const char *, const char *);
12302      char    *strstr(const char *, const char *);
12303      char    *strtok(char *restrict, const char *restrict);
12304 TSF  char    *strtok_r(char *, const char *, char **);
12305      size_t   strxfrm(char *restrict, const char *restrict, size_t);
```

12306 XSI Inclusion of the **<string.h>** header may also make visible all symbols from **<stddef.h>**.

12307 **APPLICATION USAGE**

12308 None.

12309 **RATIONALE**

12310 None.

12311 **FUTURE DIRECTIONS**

12312 None.

12313 **SEE ALSO**

12314 **<sys/types.h>**, the System Interfaces volume of IEEE Std. 1003.1-200x, *memccpy*( ), *memchr*( ),

12318 **CHANGE HISTORY**

12319 First released in Issue 1. Derived from Issue 1 of the SVID. |

12320 **Issue 4**

12321 A reference is added to **<stddef.h>** for the definition of **size_t**.

12322 The *memccpy*( ) function is marked as an extension.

12323 A warning is added indicating that inclusion of **<string.h>** may also make visible all symbols
12324 from **<stddef.h>**.

12325 The APPLICATION USAGE section is removed.

12326 The following changes are incorporated for alignment with the ISO C standard:

12327 - The function declarations in this header are expanded to full ISO C standard prototypes.
12328 - The name *memmove*( ) is added to the list of functions declared in this header.

12329 **Issue 4, Version 2**

12330 For X/OPEN UNIX conformance, the *strdup*( ) function is added to the list of functions declared
12331 in this header.

12332 **Issue 5**

12333 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

12334 **Issue 6**

12335 The *strtok_r*( ) function is marked as part of the _POSIX_THREAD_SAFE_FUNCTIONS option. |

12336 This reference page is updated to align with the ISO/IEC 9899:1999 standard. |

12337 **NAME**

12338 strings.h — string operations

12339 **SYNOPSIS**

12340 XSI
```
#include <strings.h>
```
12341

12342 **DESCRIPTION**

12343 The following shall be declared as functions and may also be defined as macros. Function
12344 prototypes shall be provided for use with an ISO C standard compiler.

```
12345 int    bcmp(const void *, const void *, size_t); (LEGACY)
12346 void   bcopy(const void *, void *, size_t); (LEGACY)
12347 void   bzero(void *, size_t); (LEGACY)
12348 int    ffs(int);
12349 char  *index(const char *, int); (LEGACY)
12350 char  *rindex(const char *, int); (LEGACY)
12351 int    strcasecmp(const char *, const char *);
12352 int    strncasecmp(const char *, const char *, size_t);
```

12353 The **size_t** type shall be defined through **typedef** as described in **<stddef.h>**.

12354 **APPLICATION USAGE**

12355 None.

12363 **CHANGE HISTORY**

12364 First released in Issue 4, Version 2.

12365 **Issue 6**

12366 The Open Group corrigenda item U021/2 has been applied, correcting the prototype for *index*( )
12367 to be consistent with the reference page. |

12368 The *bcmp*( ), *bcopy*( ), *bzero*( ), *index*( ), and *rindex*( ) functions are marked LEGACY. |

12369 **NAME**

12370 stropts.h — STREAMS interface (**STREAMS**)

12371 **SYNOPSIS**

12372 XSR
```
#include <stropts.h>
```
12373

12374 **DESCRIPTION**

12375 The **<stropts.h>** header shall define the **bandinfo** structure that includes at least the following
12376 members:

```
12377 unsigned char bi_pri
12378 int           bi_flag
```

12379 The **<stropts.h>** header shall define the **strpeek** structure that includes at least the following
12380 members:

```
12381 struct strbuf ctlbuf
12382 struct strbuf databuf
12383 t_uscalar_t   flags
```

12384 The **<stropts.h>** header shall define the **strbuf** structure that includes at least the following
12385 members:

```
12386 int           maxlen      Maximum buffer length.
12387 int           len         Length of data.
12388 char         *buf         Pointer to buffer.
```

12389 The **<stropts.h>** header shall define the **strfdinsert** structure that includes at least the following
12390 members:

```
12391 struct strbuf ctlbuf
12392 struct strbuf databuf
12393 t_uscalar_t   flags
12394 int           fildes
12395 int           offset
```

12396 The **<stropts.h>** header shall define the **strioctl** structure that includes at least the following
12397 members:

```
12398 int           ic_cmd
12399 int           ic_timout
12400 int           ic_len
12401 char         *ic_dp
```

12402 The **<stropts.h>** header shall define the **strrecvfd** structure that includes at least the following
12403 members:

```
12404 int           fd
12405 uid_t         uid
12406 gid_t         gid
```

12407 The **uid_t** and **gid_t** types shall be defined through **typedef** as described in **<sys/types.h>**.

12408 The **t_uscalar_t** type shall be defined as described in the referenced XNS, Issue 5 specification, |
12409 **<xti.h>**.

12410 The **<stropts.h>** header shall define the **str_list** structure that includes at least the following
12411 members:

```
int               sl_nmods
struct str_mlist *sl_modlist
```

The **<stropts.h>** header shall define the **str_mlist** structure that includes at least the following member:

```
char           l_name[FMNAMESZ+1]
```

At least the following macros shall be defined for use as the *request* argument to *ioctl*( ):

I_PUSH — Push STREAMS module onto the top of the current STREAM, just below the STREAM head.

I_POP — Remove STREAMS module from just below the STREAM head.

I_LOOK — Retrieve the name of the module just below the STREAM head and place it in a character string. At least the following macros shall be defined for use as the *arg* argument:

- FMNAMESZ — The minimum size in bytes of the buffer referred to by the *arg* argument.

I_FLUSH — This request flushes all input and/or output queues, depending on the value of the *arg* argument. At least the following macros shall be defined for use as the *arg* argument:

- FLUSHR — Flush read queues.
- FLUSHW — Flush write queues.
- FLUSHRW — Flush read and write queues.

I_FLUSHBAND — Flush only band specified.

I_SETSIG — Informs the STREAM head that the process wants the SIGPOLL signal issued (see *signal*( )) when a particular event has occurred on the STREAM.

The **<stropts.h>** header shall define the following possible values for *arg* when I_SETSIG is specified:

- S_RDNORM — A normal (priority band set to 0) message has arrived at the head of a STREAM head read queue.
- S_RDBAND — A message with a non-zero priority band has arrived at the head of a STREAM head read queue.
- S_INPUT — A message, other than a high-priority message, has arrived at the head of a STREAM head read queue.
- S_HIPRI — A high-priority message is present on a STREAM head read queue.
- S_OUTPUT — The write queue for normal data (priority band 0) just below the STREAM head is no longer full. This notifies the process that there is room on the queue for sending (or writing) normal data downstream.
- S_WRNORM — Same as S_OUTPUT.
- S_WRBAND — The write queue for a non-zero priority band just below the STREAM head is no longer full.

	S_MSG	A STREAMS signal message that contains the SIGPOLL signal reaches the front of the STREAM head read queue.
	S_ERROR	Notification of an error condition reaches the STREAM head.
	S_HANGUP	Notification of a hangup reaches the STREAM head.
	S_BANDURG	When used in conjunction with S_RDBAND, SIGURG is generated instead of SIGPOLL when a priority message reaches the front of the STREAM head read queue.
I_GETSIG		Returns the events for which the calling process is currently registered to be sent a SIGPOLL signal.
I_FIND		Compares the names of all modules currently present in the STREAM to the name pointed to by *arg*.
I_PEEK		Allows a process to retrieve the information in the first message on the STREAM head read queue without taking the message off the queue. At least the following macros are defined for use as the *arg* argument:
	RS_HIPRI	Only look for high-priority messages.
I_SRDOPT		Sets the read mode. At least the following macros shall be defined for use as the *arg* argument:
	RNORM	Byte-STREAM mode, the default.
	RMSGD	Message-discard mode.
	RMSGN	Message-nondiscard mode.
	RPROTNORM	Fail *read*( ) with [EBADMSG] if a message containing a control part is at the front of the STREAM head read queue.
	RPROTDAT	Deliver the control part of a message as data when a process issues a *read*( ).
	RPROTDIS	Discard the control part of a message, delivering any data part, when a process issues a *read*( ).
I_GRDOPT		Returns the current read mode setting.
I_NREAD		Counts the number of data bytes in data blocks in the first message on the STREAM head read queue.
I_FDINSERT		Creates a message from the specified buffer(s), adds information about another STREAM, and sends the message downstream.
I_STR		Constructs an internal STREAMS *ioctl*( ) message and sends that message downstream.
I_SWROPT		Sets the write mode. At least the following macros are defined for use as the *arg* argument:
	SNDZERO	Send a zero-length message downstream when a *write*( ) of 0 bytes occurs.
I_GWROPT		Returns the current write mode setting.
I_SENDFD		Requests the STREAM associated with *fildes* to send a message, containing a file pointer, to the STREAM head at the other end of a STREAMS pipe.

12493 I_RECVFD Retrieves the file descriptor associated with the message sent by an
12494 I_SENDFD *ioctl*( ) over a STREAMS pipe.

12495 I_LIST This request allows the process to list all the module names on the STREAM,
12496 up to and including the topmost driver name.

12497 I_ATMARK This request allows the process to see if the current message on the STREAM
12498 head read queue is ‘‘marked’’ by some module downstream. At least the
12499 following macros are defined for use as the *arg* argument:

12500 ANYMARK Check if the message is marked.

12501 LASTMARK Check if the message is the last one marked on the queue.

12502 I_CKBAND Check if the message of a given priority band exists on the STREAM head
12503 read queue.

12504 I_GETBAND Return the priority band of the first message on the STREAM head read
12505 queue.

12506 I_CANPUT Check if a certain band is writable.

12507 I_SETCLTIME Allow the process to set the time the STREAM head delays when a STREAM
12508 is closing and there is data on the write queues.

12509 I_GETCLTIME Returns the close time delay.

12510 I_LINK Connects two STREAMs.

12511 I_UNLINK Disconnects the two STREAMs. The header shall define at least the following
12512 value for *arg*:

12513 MUXID_ALL Unlink all STREAMs linked to the STREAM associated with
12514 *fildes*.

12515 I_PLINK Connects two STREAMs with a persistent link.

12516 I_PUNLINK Disconnects the two STREAMs that were connected with a persistent link.

12517 The following macros shall be defined for *getmsg*( ), *getpmsg*( ), *putmsg*( ), and *putpmsg*( ):

12518 MSG_ANY Receive any message.

12519 MSG_BAND Receive message from specified band.

12520 MSG_HIPRI Send/receive high-priority message.

12521 MORECTL More control information is left in message.

12522 MOREDATA More data is left in message.

12523 The **<stropts.h>** header may make visible all of the symbols from **<unistd.h>**.

12524 The following shall be declared as functions in the **<stropts.h>** header and may also be defined
12525 as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
12526 int    isastream(int);
12527 int    getmsg(int, struct strbuf *restrict, struct strbuf *restrict,
12528            int *restrict);
12529 int    getpmsg(int, struct strbuf *restrict, struct strbuf *restrict,
12530            int *restrict, int *restrict);
12531 int    ioctl(int, int, ... );
12532 int    putmsg(int, const struct strbuf *, const struct strbuf *, int);
12533 int    putpmsg(int, const struct strbuf *, const struct strbuf *, int,
```

```
                int);
        int     fattach(int, const char *);
        int     fdetach(const char *);
```

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

The *flags* member of the **strpeek** and **strfdinsert** structures are changed from **type long** to **t_uscalar_t**.

Issue 6

This header is marked as part of the XSI STREAMS Option Group.

The **restrict** keyword is added to the prototypes for *getmsg*( ) and *getpmsg*( ).

12555 **NAME**

12556 sys/ipc.h — XSI interprocess communication access structure

12557 **SYNOPSIS**

12558 XSI
```
#include <sys/ipc.h>
```
12559

12560 **DESCRIPTION**

12561 The **<sys/ipc.h>** header is used by three mechanisms for XSI interprocess communication (IPC):
12562 messages, semaphores, and shared memory. All use a common structure type, **ipc_perm** to pass
12563 information used in determining permission to perform an IPC operation.

12564 The **ipc_perm** structure shall contain the following members:

12565 `uid_t` `uid` Owner's user ID.
12566 `gid_t` `gid` Owner's group ID.
12567 `uid_t` `cuid` Creator's user ID.
12568 `gid_t` `cgid` Creator's group ID.
12569 `mode_t` `mode` Read/write permission.

12570 The **uid_t**, **gid_t**, **mode_t**, and **key_t** types shall be defined as described in **<sys/types.h>**.

12571 Definitions shall be provided for the following constants:

12572 Mode bits:

12573 IPC_CREAT Create entry if key does not exist.

12574 IPC_EXCL Fail if key exists.

12575 IPC_NOWAIT Error if request must wait.

12576 Keys:

12577 IPC_PRIVATE Private key.

12578 Control commands:

12579 IPC_RMID Remove identifier.

12580 IPC_SET Set options.

12581 IPC_STAT Get options.

12582 The following shall be declared as a function and may also be defined as a macro. Function
12583 prototypes shall be provided for use with an ISO C standard compiler.

12584
```
key_t  ftok(const char *, int);
```

12585 **APPLICATION USAGE**

12586 None.

12587 **RATIONALE**

12588 None.

12589 **FUTURE DIRECTIONS**

12590 None.

12591 **SEE ALSO**

12592 **<sys/types.h>**, the System Interfaces volume of IEEE Std. 1003.1-200x, *ftok*( )

12593 **CHANGE HISTORY**

12594 First released in Issue 2. Derived from System V Release 2.0.

12595 **Issue 4**

12596 The DESCRIPTION is corrected to say that the header ‘‘is used by three mechanisms ...’’.

12597 Reference to the **<sys/types.h>** header is added for the definitions of **uid_t**, **gid_t**, and **mode_t**.

12598 **Issue 4, Version 2**

12599 For X/OPEN UNIX conformance, the *ftok*( ) function is added to the list of functions declared in
12600 this header.

12601 **NAME**

12602 sys/mman.h — memory management declarations

12603 **SYNOPSIS**

12604
```
#include <sys/mman.h>
```

12605 **DESCRIPTION**

12606 The **<sys/mman.h>** header shall be supported if the implementation supports at least one of the
12607 following options:

12608 MF • The Memory Mapped Files option

12609 SHM • The Shared Memory Objects option

12610 ML • The Process Memory Locking option

12611 MPR • The Memory Protection option

12612 TYM • The Typed Memory Objects option

12613 SIO • The Synchronized Input and Output option

12614 ADV • The Advisory Information option

12615 TYM • The Typed Memory Objects option

12616 The following protection options shall be defined:

12617 code2 PROT_READ Page can be read.

12618 code2 PROT_WRITE Page can be written.

12619 code2 PROT_EXEC Page can be executed.

12620 code2 PROT_NONE Page cannot be accessed.

12621 The following *flag* options shall be defined:

12622 MF|SHM MAP_SHARED Share changes.

12623 MF|SHM MAP_PRIVATE Changes are private.

12624 MF|SHM MAP_FIXED Interpret *addr* exactly.

12625 The following flags shall be defined for *msync*( ):

12626 MF|SIO MS_ASYNC Perform asynchronous writes.

12627 MF|SIO MS_SYNC Perform synchronous writes.

12628 MF|SIO MS_INVALIDATE Invalidate mappings.

12629 ML The following symbolic constants shall be defined for the *mlockall*( ) function:

12630 ML MCL_CURRENT Lock currently mapped pages.

12631 ML MCL_FUTURE Lock pages that become mapped.

12632 MF|SHM The symbolic constant MAP_FAILED shall be defined to indicate a failure from the *mmap*( )
12633 function.

12634 code1 Values for *advice* used by *posix_madvise*( ) are as follows:

12635 POSIX_MADV_NORMAL
12636 The application has no advice to give on its behavior with respect to the specified range. It
12637 is the default characteristic if no advice is given for a range of memory.

POSIX_MADV_SEQUENTIAL
The application expects to access the specified range sequentially from lower addresses to higher addresses.

POSIX_MADV_RANDOM
The application expects to access the specified range in a random order.

POSIX_MADV_WILLNEED
The application expects to access the specified range in the near future.

POSIX_MADV_DONTNEED
The application expects that it will not access the specified range in the near future.

TYM The following flags shall be defined for *posix_typed_mem_open*( ):

POSIX_TYPED_MEM_ALLOCATE
Allocate on *mmap*( ).

POSIX_TYPED_MEM_ALLOCATE_CONTIG
Allocate contiguously on *mmap*( ).

POSIX_TYPED_MEM_MAP_ALLOCATABLE Map on *mmap*( ), without affecting allocatability.

The **mode_t**, **off_t**, and **size_t** types shall be defined as described in **<sys/types.h>**.

TYM The **<sys/mman.h>** header shall define the structure **posix_typed_mem_info**, which includes at least the following member:

```
size_t  posix_tmi_length   Maximum length which may be allocated
                           from a typed memory object.
```

The following shall be declared in **<sys/mman.h>** as functions and may also be defined as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
ML      int    mlock(const void *, size_t);
        int    mlockall(int);
MF|SHM  void  *mmap(void *, size_t, int, int, int, off_t);
MPR     int    mprotect(void *, size_t, int);
MF|SIO  int    msync(void *, size_t, int);
ML      int    munlock(const void *, size_t);
        int    munlockall(void);
MF|SHM  int    munmap(void *, size_t);
ADV     int    posix_madvise(void *, size_t, int);
TYM     int    posix_mem_offset(const void *restrict, size_t, off_t *restrict,
                   size_t *restrict, int *restrict);
        int    posix_typed_mem_get_info(int, struct posix_typed_mem_info *);
        int    posix_typed_mem_open(const char *, int, int);
SHM     int    shm_open(const char *, int, mode_t);
        int    shm_unlink(const char *);
```

12679 **APPLICATION USAGE**

12680 None.

12681 **RATIONALE**

12682 None.

12683 **FUTURE DIRECTIONS**

12684 None.

12685 **SEE ALSO**

12686 **<sys/types.h>**, the System Interfaces volume of IEEE Std. 1003.1-200x, *mlock*( ), *mlockall*( ),

12688 *posix_typed_mem_get_info*( ), *posix_typed_mem_open*( ), *shm_open*( ), *shm_unlink*( )

12689 **CHANGE HISTORY**

12690 First released in Issue 4, Version 2.

12691 **Issue 5**

12692 Updated for alignment with the POSIX Realtime Extension.

12693 **Issue 6**

12694 The **<sys/mman.h>** header is marked as dependent on support for either the
12695 _POSIX_MAPPED_FILES, _POSIX_MEMLOCK, or _POSIX_SHARED_MEMORY options.

12696 The following changes are made for alignment with IEEE Std. 1003.1j-2000:

12697 • The TYM margin code is added to the list of margin codes for the **<sys/mman.h>** header line,
12698 as well as for other lines.

12699 • The POSIX_TYPED_MEM_ALLOCATE, POSIX_TYPED_MEM_ALLOCATE_CONTIG, and
12700 POSIX_TYPED_MEM_MAP_ALLOCATABLE flags are added.

12701 • The **posix_tmi_length** structure is added.

12702 • The *posix_mem_offset*( ), *posix_typed_mem_get_info*( ), and *posix_typed_mem_open*( ) functions
12703 are added.

12704 The **restrict** keyword is added to the prototype for *posix_mem_offset*( ). |

12705 IEEE PASC Interpretation 1003.1 #102 is applied adding the prototype for *posix_madvise*( ). |

12706 **NAME**

12707 sys/msg.h — XSI message queue structures

12708 **SYNOPSIS**

12709 XSI
```
#include <sys/msg.h>
```
12710

12711 **DESCRIPTION**

12712 The **<sys/msg.h>** header shall define the following constant and members of the structure
12713 **msqid_ds**.

12714 The following data types shall be defined through **typedef**:

12715 **msgqnum_t** Used for the number of messages in the message queue.

12716 **msglen_t** Used for the number of bytes allowed in a message queue.

12717 These types shall be unsigned integer types that are able to store values at least as large as a type
12718 **unsigned short**.

12719 Message operation flag:

12720 MSG_NOERROR No error if big message.

12721 The **msqid_ds** structure shall contain the following members:

12722 `struct ipc_perm msg_perm` Operation permission structure.
12723 `msgqnum_t msg_qnum` Number of messages currently on queue.
12724 `msglen_t msg_qbytes` Maximum number of bytes allowed on queue.
12725 `pid_t msg_lspid` Process ID of last *msgsnd*( ).
12726 `pid_t msg_lrpid` Process ID of last *msgrcv*( ).
12727 `time_t msg_stime` Time of last *msgsnd*( ).
12728 `time_t msg_rtime` Time of last *msgrcv*( ).
12729 `time_t msg_ctime` Time of last change.

12730 The **pid_t**, **time_t**, **key_t**, **size_t**, and **ssize_t** types shall be defined as described in **<sys/types.h>**.

12731 The following shall be declared as functions and may also be defined as macros. Function
12732 prototypes shall be provided for use with an ISO C standard compiler.

```
12733 int       msgctl(int, int, struct msqid_ds *);
12734 int       msgget(key_t, int);
12735 ssize_t   msgrcv(int, void *, size_t, long, int);
12736 int       msgsnd(int, const void *, size_t, int);
```

12737 In addition, all of the symbols from **<sys/ipc.h>** shall be defined when this header is included.

12738 **APPLICATION USAGE**

12739 None.

12740 **RATIONALE**

12741 None.

12742 **FUTURE DIRECTIONS**

12743 None.

12744 **SEE ALSO**

12745 **<sys/types.h>**, *msgctl*( ), *msgget*( ), *msgrcv*( ), *msgsnd*( )

12746 **CHANGE HISTORY**

12747 First released in Issue 2. Derived from System V Release 2.0.

12748 **Issue 4**

12749 The function declarations in this header are expanded to full ISO C standard prototypes.

12750 Reference to the **<sys/types.h>** header is added for the definitions of **pid_t**, **time_t**, **key_t**, and
12751 **size_t**.

12752 A statement is added indicating that all symbols in **<sys/ipc.h>** are defined when this header is
12753 included.

12754 **NAME**

12755 sys/resource.h — definitions for XSI resource operations

12756 **SYNOPSIS**

12757 XSI
```
#include <sys/resource.h>
```
12758

12759 **DESCRIPTION**

12760 The **<sys/resource.h>** header shall define the following symbolic constants as possible values of
12761 the *which* argument of *getpriority*( ) and *setpriority*( ):

12762 PRIO_PROCESS Identifies the *who* argument as a process ID.

12763 PRIO_PGRP Identifies the *who* argument as a process group ID.

12764 PRIO_USER Identifies the *who* argument as a user ID.

12765 The following type shall be defined through **typedef**:

12766 **rlim_t** Unsigned integer type used for limit values.

12767 The following symbolic constants shall be defined:

12768 RLIM_INFINITY A value of **rlim_t** indicating no limit.

12769 RLIM_SAVED_MAX A value of type **rlim_t** indicating an unrepresentable saved hard
12770 limit.

12771 RLIM_SAVED_CUR A value of type **rlim_t** indicating an unrepresentable saved soft limit.

12772 On implementations where all resource limits are representable in an object of type **rlim_t**,
12773 RLIM_SAVED_MAX and RLIM_SAVED_CUR need not be distinct from RLIM_INFINITY.

12774 The following symbolic constants shall be defined as possible values of the *who* parameter of
12775 *getrusage*( ):

12776 RUSAGE_SELF Returns information about the current process.

12777 RUSAGE_CHILDREN Returns information about children of the current process.

12778 The **<sys/resource.h>** header shall define the **rlimit** structure that includes at least the following
12779 members:

12780 `rlim_t rlim_cur` The current (soft) limit.
12781 `rlim_t rlim_max` The hard limit.

12782 The **<sys/resource.h>** header shall define the **rusage** structure that includes at least the following
12783 members:

12784 `struct timeval ru_utime` User time used.
12785 `struct timeval ru_stime` System time used.

12786 The **timeval** structure shall be defined as described in **<sys/time.h>**.

12787 The following symbolic constants shall be defined as possible values for the *resource* argument of
12788 *getrlimit*( ) and *setrlimit*( ):

12789 RLIMIT_CORE Limit on size of core dump file.

12790 RLIMIT_CPU Limit on CPU time per process.

12791 RLIMIT_DATA Limit on data segment size.

12792 RLIMIT_FSIZE Limit on file size.

RLIMIT_NOFILE	Limit on number of open files.
RLIMIT_STACK	Limit on stack size.
RLIMIT_AS	Limit on address space size.

The following are declared as functions and may also be defined as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
int  getpriority(int, id_t);
int  getrlimit(int, struct rlimit *);
int  getrusage(int, struct rusage *);
int  setpriority(int, id_t, int);
int  setrlimit(int, const struct rlimit *);
```

The **id_t** type shall be defined through **typedef** as described in **<sys/types.h>**.

Inclusion of the **<sys/resource.h>** header may also make visible all symbols from **<sys/time.h>**.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Large File System extensions are added.

12818 **NAME**
12819 sys/select.h — select types

12820 **SYNOPSIS**
12821 `#include <sys/select.h>`

12822 **DESCRIPTION**
12823 The **<sys/select.h>** header shall define the **timeval** structure that includes at least the following
12824 members:

12825 `time_t` `tv_sec` Seconds.
12826 `suseconds_t` `tv_usec` Microseconds.

12827 The **time_t** and **suseconds_t** types shall be defined as described in **<sys/types.h>**.

12828 The **sigset_t** type shall be defined as described in **<signal.h>**.

12829 The **timespec** structure shall be defined as described in **<time.h>**.

12830 The **<sys/select.h>** header shall define the **fd_set** type as a structure that includes at least the
12831 following member:

12832 `long fds_bits[]` Bit mask for open file descriptions.

12833 Each of the following may be declared as a function, or defined as a macro, or both:

12834 void FD_CLR(int *fd*, fd_set **fdset*)
12835 Clears the bit for the file descriptor *fd* in the file descriptor set *fdset*.

12836 int FD_ISSET(int *fd*, fd_set **fdset*)
12837 Returns a non-zero value if the bit for the file descriptor *fd* is set in the file descriptor set by
12838 *fdset*, and 0 otherwise.

12839 void FD_SET(int *fd*, fd_set **fdset*)
12840 Sets the bit for the file descriptor *fd* in the file descriptor set *fdset*.

12841 void FD_ZERO(fd_set **fdset*)
12842 Initializes the file descriptor set *fdset* to have zero bits for all file descriptors.

12843 FD_SETSIZE
12844 Maximum number of file descriptors in an **fd_set** structure.

12845 If implemented as macros, these may evaluate their arguments more than once, so applications
12846 should ensure that the arguments they supply are never expressions with side effects.

12847 The following shall be declared as functions and may also be defined as macros. Function
12848 prototypes shall be provided for use with an ISO C standard compiler.

```
12849 int  pselect(int, fd_set *, fd_set *, fd_set *, const struct timespec *,
12850          const sigset_t *);
12851 int  select(int, fd_set *, fd_set *, fd_set *, struct timeval *);
```

12852 Inclusion of the **<sys/select.h>** header may make visible all symbols from the headers
12853 **<signal.h>**, **<sys/time.h>**, and **<time.h>**.

12854 **APPLICATION USAGE**
12855 None.

12856 **RATIONALE**
12857 None.

12858 **FUTURE DIRECTIONS**
12859 None.

12860 **SEE ALSO**

12862 IEEE Std. 1003.1-200x, *pselect*( ), *select*( )

12863 **CHANGE HISTORY**
12864 First released in Issue 6. Derived from IEEE Std. 1003.1g-2000.

12865 **NAME**

12866 sys/sem.h — XSI semaphore facility

12867 **SYNOPSIS**

12868 XSI
```
#include <sys/sem.h>
```
12869

12870 **DESCRIPTION**

12871 The **<sys/sem.h>** header shall define the following constants and structures.

12872 Semaphore operation flags:

12873 SEM_UNDO Set up adjust on exit entry.

12874 Command definitions for the *semctl*( ) function shall be provided as follows:

12875 GETNCNT Get *semncnt*.

12876 GETPID Get *sempid*.

12877 GETVAL Get *semval*.

12878 GETALL Get all cases of *semval*.

12879 GETZCNT Get *semzcnt*.

12880 SETVAL Set *semval*.

12881 SETALL Set all cases of *semval*.

12882 The **semid_ds** structure shall contain the following members:

12883 `struct ipc_perm` `sem_perm` Operation permission structure.
12884 `unsigned short` `sem_nsems` Number of semaphores in set.
12885 `time_t` `sem_otime` Last *semop*( ) time.
12886 `time_t` `sem_ctime` Last time changed by *semctl*( ).

12887 The **pid_t**, **time_t**, **key_t**, and **size_t** types shall be defined as described in **<sys/types.h>**.

12888 A semaphore shall be represented by an anonymous structure containing the following
12889 members:

12890 `unsigned short` `semval` Semaphore value.
12891 `pid_t` `sempid` Process ID of last operation.
12892 `unsigned short` `semncnt` Number of processes waiting for *semval*
12893 to become greater than current value.
12894 `unsigned short` `semzcnt` Number of processes waiting for *semval*
12895 to become 0.

12896 The **sembuf** structure shall contain the following members:

12897 `unsigned short` `sem_num` Semaphore number.
12898 `short` `sem_op` Semaphore operation.
12899 `short` `sem_flg` Operation flags.

12900 The following shall be declared as functions and may also be defined as macros. Function
12901 prototypes shall be provided for use with an ISO C standard compiler.

```
12902 int   semctl(int, int, int, ...);
12903 int   semget(key_t, int, int);
12904 int   semop(int, struct sembuf *, size_t);
```

12905 In addition, all of the symbols from **<sys/ipc.h>** shall be defined when this header is included.

12906 **APPLICATION USAGE**

12907 None.

12908 **RATIONALE**

12909 None.

12910 **FUTURE DIRECTIONS**

12911 None.

12912 **SEE ALSO**

12913 **<sys/types.h>**, *semctl*( ), *semget*( ), *semop*( )

12914 **CHANGE HISTORY**

12915 First released in Issue 2. Derived from System V Release 2.0.

12916 **Issue 4**

12917 The function declarations in this header are expanded to full ISO C standard prototypes.

12918 Reference to the **<sys/types.h>** header is added for the definitions of **pid_t**, **time_t**, **key_t**, and
12919 **size_t**.

12920 A statement is added indicating that all symbols in **<sys/ipc.h>** are defined when this header is
12921 included.

12922 **NAME**

12923 sys/shm.h — XSI shared memory facility

12924 **SYNOPSIS**

12925 XSI
```
#include <sys/shm.h>
```
12926

12927 **DESCRIPTION**

12928 The **<sys/shm.h>** header shall define the following symbolic constants:

12929 SHM_RDONLY Attach read-only (else read-write).

12930 SHM_RND Round attach address to SHMLBA.

12931 The **<sys/shm.h>** header shall define the following symbolic value:

12932 SHMLBA Segment low boundary address multiple.

12933 The following data types shall be defined through **typedef**:

12934 **shmatt_t** Unsigned integer used for the number of current attaches that must be able to
12935 store values at least as large as a type **unsigned short**.

12936 The **shmid_ds** structure shall contain the following members:

12937	`struct ipc_perm`	`shm_perm` Operation permission structure.
12938	`size_t`	`shm_segsz` Size of segment in bytes.
12939	`pid_t`	`shm_lpid` Process ID of last shared memory operation.
12940	`pid_t`	`shm_cpid` Process ID of creator.
12941	`shmatt_t`	`shm_nattch` Number of current attaches.
12942	`time_t`	`shm_atime` Time of last *shmat*( ).
12943	`time_t`	`shm_dtime` Time of last *shmdt*( ).
12944	`time_t`	`shm_ctime` Time of last change by *shmctl*( ).

12945 The **pid_t**, **time_t**, **key_t**, and **size_t** types shall be defined as described in **<sys/types.h>**.

12946 The following shall be declared as functions and may also be defined as macros. Function
12947 prototypes shall be provided for use with an ISO C standard compiler.

```
12948 void *shmat(int, const void *, int);
12949 int   shmctl(int, int, struct shmid_ds *);
12950 int   shmdt(const void *);
12951 int   shmget(key_t, size_t, int);
```

12952 In addition, all of the symbols from **<sys/ipc.h>** shall be defined when this header is included.

12953 **APPLICATION USAGE**

12954 None.

12955 **RATIONALE**

12956 None.

12957 **FUTURE DIRECTIONS**

12958 None.

12959 **SEE ALSO**

12960 **<sys/types.h>**, the System Interfaces volume of IEEE Std. 1003.1-200x, *shmat*( ), *shmctl*( ), *shmdt*( ),
12961 *shmget*( )

12962 **CHANGE HISTORY**

12963 First released in Issue 2. Derived from System V Release 2.0.

12964 **Issue 4**

12965 The function declarations in this header are expanded to full ISO C standard prototypes.

12966 Reference to the **<sys/types.h>** header is added for the definitions of **pid_t**, **time_t**, **key_t**, and
12967 **size_t**.

12968 A statement is added indicating that all symbols in **<sys/ipc.h>** are defined when this header is
12969 included.

12970 **Issue 5**

12971 The type of *shm_segsz* is changed from **int** to **size_t**.

12972 **NAME**

12973 sys/socket.h — main sockets header

12974 **SYNOPSIS**

12975 `#include <sys/socket.h>`

12976 **DESCRIPTION**

12977 The **<sys/socket.h>** header shall make available the type, **socklen_t**, which is an opaque integer
12978 type of length of at least 32 bits; see APPLICATION USAGE.

12979 The **<sys/socket.h>** header shall define the unsigned integer type **sa_family_t**.

12980 The **<sys/socket.h>** header shall define the **sockaddr** structure that includes at least the
12981 following members:

12982 `sa_family_t  sa_family` Address family.
12983 `char  sa_data[]` Socket address (variable-length data).

12984 The **sockaddr** structure is used to define a socket address which is used in the *bind*( ), *connect*( ),
12985 *getpeername*( ), *getsockname*( ), *recvfrom*( ), and *sendto*( ) functions.

12986 The **<sys/socket.h>** header shall define the **sockaddr_storage** structure. This structure shall be:

12987 - Large enough to accommodate all supported protocol-specific address structures

12988 - Aligned at an appropriate boundary so that pointers to it can be cast as pointers to protocol-
12989 specific address structures and used to access the fields of those structures without
12990 alignment problems

12991 The **sockaddr_storage** structure shall contain at least the following members:

12992 `sa_family_t  ss_family`

12993 When a **sockaddr_storage** structure is cast as a **sockaddr** structure, the *ss_family* field of the
12994 **sockaddr_storage** structure maps onto the *sa_family* field of the **sockaddr** structure. When a
12995 **sockaddr_storage** structure is cast as a protocol-specific address structure, the *ss_family* field
12996 maps onto a field of that structure that is of type **sa_family_t** and that identifies the protocol's
12997 address family.

12998 The **<sys/socket.h>** header shall define the **msghdr** structure that includes at least the following
12999 members:

13000 `void  *msg_name` Optional address.
13001 `socklen_t  msg_namelen` Size of address.
13002 `struct iovec  *msg_iov` Scatter/gather array.
13003 `int  msg_iovlen` Members in msg_iov.
13004 `void  *msg_control` Ancillary data; see below.
13005 `socklen_t  msg_controllen` Ancillary data buffer len.
13006 `int  msg_flags` Flags on received message.

13007 The **msghdr** structure is used to minimize the number of directly supplied parameters to the
13008 *recvmsg*( ) and *sendmsg*( ) functions. This structure is used as a *value=result* parameter in the
13009 *recvmsg*( ) function and *value* only for the *sendmsg*( ) function.

13010 The **iovec** structure shall be defined through **typedef** as described in **<sys/uio.h>**.

13011 The **<sys/socket.h>** header shall define the **cmsghdr** structure that includes at least the following
13012 members:

13013 `socklen_t  cmsg_len` Data byte count, including the cmsghdr.
13014 `int  cmsg_level` Originating protocol.

13015 `int cmsg_type` Protocol-specific type.

13016 The **cmsghdr** structure is used for storage of ancillary data object information.

13017 Ancillary data consists of a sequence of pairs, each consisting of a **cmsghdr** structure followed
13018 by a data array. The data array contains the ancillary data message, and the **cmsghdr** structure
13019 contains descriptive information that allows an application to correctly parse the data.

13020 The values for *cmsg_level* shall be legal values for the *level* argument to the *getsockopt*( ) and
13021 *setsockopt*( ) functions. The system documentation shall specify the *cmsg_type* definitions for the
13022 supported protocols.

13023 Ancillary data is also possible at the socket level. The **<sys/socket.h>** header defines the
13024 following macro for use as the *cmsg_type* value when *cmsg_level* is SOL_SOCKET:

13025 SCM_RIGHTS Indicates that the data array contains the access rights to be sent or
13026 received.

13027 The **<sys/socket.h>** header defines the following macros to gain access to the data arrays in the
13028 ancillary data associated with a message header:

13029 CMSG_DATA(*cmsg*)
13030 If the argument is a pointer to a **cmsghdr** structure, this macro returns an unsigned
13031 character pointer to the data array associated with the **cmsghdr** structure.

13032 CMSG_NXTHDR(*mhdr*,*cmsg*)
13033 If the first argument is a pointer to a **msghdr** structure and the second argument is a pointer
13034 to a **cmsghdr** structure in the ancillary data pointed to by the *msg_control* field of that
13035 **msghdr** structure, this macro returns a pointer to the next **cmsghdr** structure, or a null
13036 pointer if this structure is the last **cmsghdr** in the ancillary data.

13037 CMSG_FIRSTHDR(*mhdr*)
13038 If the argument is a pointer to a **msghdr** structure, this macro returns a pointer to the first
13039 **cmsghdr** structure in the ancillary data associated with this **msghdr** structure, or a null
13040 pointer if there is no ancillary data associated with the **msghdr** structure.

13041 The **<sys/socket.h>** header shall define the **linger** structure that includes at least the following
13042 members:

13043 `int l_onoff` Indicates whether linger option is enabled.
13044 `int l_linger` Linger time, in seconds.

13045 The **<sys/socket.h>** header shall define the following macros, with distinct integral values:

13046 SOCK_DGRAM Datagram socket.

13047 SOCK_STREAM Byte-stream socket.

13048 SOCK_SEQPACKET Sequenced-packet socket.

13049 The **<sys/socket.h>** header shall define the following macro for use as the *level* argument of
13050 *setsockopt*( ) and *getsockopt*( ).

13051 SOL_SOCKET Options to be accessed at socket level, not protocol level.

13052 The **<sys/socket.h>** header shall define the following macros, with distinct integral values, for
13053 use as the *option_name* argument in *getsockopt*( ) or *setsockopt*( ) calls:

13054 SO_ACCEPTCONN Socket is accepting connections.

13055 SO_BROADCAST Transmission of broadcast messages is supported.

13056	SO_DEBUG	Debugging information is being recorded.
13057	SO_DONTROUTE	Bypass normal routing.
13058	SO_ERROR	Socket error status.
13059	SO_KEEPALIVE	Connections are kept alive with periodic messages.
13060	SO_LINGER	Socket lingers on close.
13061	SO_OOBINLINE	Out-of-band data is transmitted in line.
13062	SO_RCVBUF	Receive buffer size.
13063	SO_RCVLOWAT	Receive ''low water mark''.
13064	SO_RCVTIMEO	Receive timeout.
13065	SO_REUSEADDR	Reuse of local addresses is supported.
13066	SO_SNDBUF	Send buffer size.
13067	SO_SNDLOWAT	Send ''low water mark''.
13068	SO_SNDTIMEO	Send timeout.
13069	SO_TYPE	Socket type.

13070 The **<sys/socket.h>** header shall define the following macro as the maximum *backlog* queue
13071 length which may be specified by the *backlog* field of the *listen*( ) function:

13072	SOMAXCONN	The maximum *backlog* queue length.

13073 The **<sys/socket.h>** header shall define the following macros, with distinct integral values, for
13074 use as the valid values for the *msg_flags* field in the **msghdr** structure, or the *flags* parameter in
13075 *recvfrom*( ), *recvmsg*( ), *sendmsg*( ), or *sendto*( ) calls:

13076	MSG_CTRUNC	Control data truncated.
13077	MSG_DONTROUTE	Send without using routing tables.
13078	MSG_EOR	Terminates a record (if supported by the protocol).
13079	MSG_OOB	Out-of-band data.
13080	MSG_PEEK	Leave received data in queue.
13081	MSG_TRUNC	Normal data truncated.
13082	MSG_WAITALL	Wait for complete message.

13083 The **<sys/socket.h>** header shall define the following macros, with distinct integral values:

13084	AF_UNIX	UNIX domain sockets.
13085	AF_UNSPEC	Unspecified .
13086	AF_INET	Internet domain sockets for use with IPv4 addresses.
13087 IP6	AF_INET6	Internet domain sockets for use with IPv6 addresses.

13088 The **<sys/socket.h>** header shall define the following macros, with distinct integral values:

13089	SHUT_RD	Disables further receive operations.
13090	SHUT_WR	Disables further send operations.

SHUT_RDWR Disables further send and receive operations.

The following are declared as functions, and may also be defined as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
int     accept(int, struct sockaddr *restrict, socklen_t *restrict);
int     bind(int, const struct sockaddr *, socklen_t);
int     connect(int, const struct sockaddr *, socklen_t);
int     getpeername(int, struct sockaddr *restrict, socklen_t *);
int     getsockname(int, struct sockaddr *restrict, socklen_t *);
int     getsockopt(int, int, int, void *restrict, socklen_t *restrict);
int     listen(int, int);
ssize_t recv(int, void *, size_t, int);
ssize_t recvfrom(int, void *restrict, size_t, int,
        struct sockaddr *restrict, socklen_t *restrict);
ssize_t recvmsg(int, struct msghdr *, int);
ssize_t send(int, const void *, size_t, int);
ssize_t sendmsg(int, const struct msghdr *, int);
ssize_t sendto(int, const void *, size_t, int, const struct sockaddr *,
        socklen_t);
int     setsockopt(int, int, int, const void *, socklen_t);
int     shutdown(int, int);
int     socket(int, int, int);
int     socketpair(int, int, int, int);
```

Inclusion of **<sys/socket.h>** may also make visible all symbols from **<sys/uio.h>**.

APPLICATION USAGE

To forestall portability problems, it is recommended that applications not use values larger than $2^{32}-1$ for the **socklen_t** type.

The **sockaddr_storage** structure solves the problem of declaring storage for automatic variables which is both large enough and aligned enough for storing the socket address data structure of any family. For example, code with a file descriptor and without the context of the address family can pass a pointer to a variable of this type, where a pointer to a socket address structure is expected in calls such as *getpeername*(), and determine the address family by accessing the received content after the call.

An example implementation design of such a data structure would be as follows:

```
/*
 *  Desired design of maximum size and alignment.
 */
#define _SS_MAXSIZE 128
    /* Implementation-defined maximum size. */
#define _SS_ALIGNSIZE (sizeof(int64_t))
    /* Implementation-defined desired alignment. */

/*
 *  Definitions used for sockaddr_storage structure paddings design.
 */
#define _SS_PAD1SIZE (_SS_ALIGNSIZE – sizeof(sa_family_t))
#define _SS_PAD2SIZE (_SS_MAXSIZE – (sizeof(sa_family_t)+
                      _SS_PAD1SIZE + _SS_ALIGNSIZE))
struct sockaddr_storage {
    sa_family_t  ss_family;  /* Address family. */
```

```
        /*
         * Following fields are implementation-defined. */
         */
            char _ss_pad1[_SS_PAD1SIZE];
                /* 6-byte pad; this is to make implementation-defined
                   pad up to alignment field that follows explicit in
                   the data structure. */
            int64_t _ss_align;  /* Field to force desired structure
                                   storage alignment. */
            char _ss_pad2[_SS_PAD2SIZE];
                /* 112-byte pad to achieve desired size,
                   _SS_MAXSIZE value minus size of ss_family
                   __ss_pad1, __ss_align fields is 112. */
        };
```

The above example illustrates a data structure which aligns on a 64-bit boundary. An implementation-defined field *_ss_align* along *_ss_pad1* is used to force a 64-bit alignment which covers proper alignment good enough for needs of **sockaddr_in6** (IPv6), **sockaddr_in** (IPv4) address data structures. The size of padding fields *_ss_pad1* depends on the chosen alignment boundary. The size of padding field *_ss_pad2* depends on the value of overall size chosen for the total size of the structure. This size and alignment are represented in the above example by implementation-defined (not required) constants _SS_MAXSIZE (chosen value 128) and _SS_ALIGNMENT (with chosen value 8). Constants _SS_PAD1SIZE (derived value 6) and _SS_PAD2SIZE (derived value 112) are also for illustration and not required. The implementation-defined definitions and structure field names above start with an underscore to denote implementation private name space. Portable code is not expected to access or reference those fields or constants.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the prototypes for *accept*( ), *getpeername*( ), *getsockname*( ), *getsockopt*( ), and *recvfrom*( ).

13177 **NAME**

13178 sys/stat.h — data returned by the stat( ) function

13179 **SYNOPSIS**

13180 `#include <sys/stat.h>`

13181 **DESCRIPTION**

13182 XSI The **<sys/stat.h>** header shall define the structure of the data returned by the functions *fstat*( ),
13183 *lstat*( ), and *stat*( ).

13184 The **stat** structure shall contain at least the following members:

13185	`dev_t`	`st_dev`	ID of device containing file.
13186	`ino_t`	`st_ino`	File serial number.
13187	`mode_t`	`st_mode`	Mode of file (see below).
13188	`nlink_t`	`st_nlink`	Number of hard links to the file.
13189	`uid_t`	`st_uid`	User ID of file.
13190	`gid_t`	`st_gid`	Group ID of file.
13191 XSI	`dev_t`	`st_rdev`	Device ID (if file is character or block special).
13192	`off_t`	`st_size`	For regular files, the file size in bytes.
13193			For symbolic links, the length in bytes of the
13194			path name contained in the symbolic link.
13195			For other file types, the use of this field is
13196			unspecified
13197	`time_t`	`st_atime`	Time of last access.
13198	`time_t`	`st_mtime`	Time of last data modification.
13199	`time_t`	`st_ctime`	Time of last status change.
13200 XSI	`blksize_t`	`st_blksize`	A file system-specific preferred I/O block size for
13201			this object. In some file system types, this may
13202			vary from file to file.
13203	`blkcnt_t`	`st_blocks`	Number of blocks allocated for this object.

13204

13205 File serial number and device ID taken together uniquely identify the file within the system. The |
13206 **blkcnt_t**, **blksize_t**, **dev_t**, **ino_t**, **mode_t**, **nlink_t**, **uid_t**, **gid_t**, **off_t**, and **time_t** types shall be
13207 defined as described in **<sys/types.h>**. Times shall be given in seconds since the Epoch. |

13208 Unless otherwise specified, the structure members *st_mode*, *st_ino*, *st_dev*, *st_uid*, *st_gid*, *st_atime*,
13209 *st_ctime*, and *st_mtime* shall have meaningful values for all file types defined in
13210 IEEE Std. 1003.1-200x.

13211 For symbolic links, the *st_mode* member shall contain meaningful information, which can be
13212 used with the file type macros described below, that take a *mode* argument. The *st_size* member
13213 shall contain the length, in bytes, of the path name contained in the symbolic link. File mode bits
13214 and the contents of the remaining members of the **stat** structure are unspecified. The value
13215 returned in the *st_size* field shall be the length of the contents of the symbolic link, and shall not
13216 count a trailing null if one is present.

13217 The following symbolic names for the values of type *mode_t* shall also be defined. |

13218 File type:

13219 XSI	S_IFMT	Type of file.
13220	S_IFBLK	Block special.
13221	S_IFCHR	Character special.

	S_IFIFO	FIFO special.
	S_IFREG	Regular.
	S_IFDIR	Directory.
	S_IFLNK	Symbolic link.
	S_IFSOCK	Socket.

File mode bits:

	S_IRWXU	Read, write, execute/search by owner.
	S_IRUSR	Read permission, owner.
	S_IWUSR	Write permission, owner.
	S_IXUSR	Execute/search permission, owner.
	S_IRWXG	Read, write, execute/search by group.
	S_IRGRP	Read permission, group.
	S_IWGRP	Write permission, group.
	S_IXGRP	Execute/search permission, group.
	S_IRWXO	Read, write, execute/search by others.
	S_IROTH	Read permission, others.
	S_IWOTH	Write permission, others.
	S_IXOTH	Execute/search permission, others.
	S_ISUID	Set-user-ID on execution.
	S_ISGID	Set-group-ID on execution.
XSI	S_ISVTX	On directories, restricted deletion flag.

XSI The bits defined by S_IRUSR, S_IWUSR, S_IXUSR, S_IRGRP, S_IWGRP, S_IXGRP, S_IROTH, S_IWOTH, S_IXOTH, S_ISUID, S_ISGID, and S_ISVTX shall be unique.

S_IRWXU is the bitwise-inclusive OR of S_IRUSR, S_IWUSR, and S_IXUSR.

S_IRWXG is the bitwise-inclusive OR of S_IRGRP, S_IWGRP, and S_IXGRP.

S_IRWXO is the bitwise-inclusive OR of S_IROTH, S_IWOTH, and S_IXOTH.

Implementations may OR other implementation-defined bits into S_IRWXU, S_IRWXG, and S_IRWXO, but they shall not overlap any of the other bits defined in this volume of IEEE Std. 1003.1-200x. The *file permission bits* are defined to be those corresponding to the bitwise-inclusive OR of S_IRWXU, S_IRWXG, and S_IRWXO.

The following macros shall be provided to test whether a file is of the specified type. The value *m* supplied to the macros is the value of *st_mode* from a **stat** structure. The macro shall evaluate to a non-zero value if the test is true; 0 if the test is false.

S_ISBLK(*m*)	Test for a block special file.
S_ISCHR(*m*)	Test for a character special file.
S_ISDIR(*m*)	Test for a directory.

S_ISFIFO(*m*) Test for a pipe or FIFO special file.

S_ISREG(*m*) Test for a regular file.

S_ISLNK(*m*) Test for a symbolic link.

S_ISSOCK(*m*) Test for a socket.

The implementation may implement message queues, semaphores, or shared memory objects as distinct file types. The following macros shall be provided to test whether a file is of the specified type. The value of the *buf* argument supplied to the macros is a pointer to a **stat** structure. The macro shall evaluate to a non-zero value if the specified object is implemented as a distinct file type and the specified file type is contained in the **stat** structure referenced by *buf*. Otherwise, the macro shall evaluate to zero.

S_TYPEISMQ(*buf*) Test for a message queue.

S_TYPEISSEM(*buf*) Test for a semaphore.

S_TYPEISSHM(*buf*) Test for a shared memory object.

TYM The implementation may implement typed memory objects as distinct file types, and the following macro shall test whether a file is of the specified type. The value of the *buf* argument supplied to the macros is a pointer to a **stat** structure. The macro shall evaluate to a non-zero value if the specified object is implemented as a distinct file type and the specified file type is contained in the **stat** structure referenced by *buf*. Otherwise, the macro shall evaluate to zero.

S_TYPEISTMO(*buf*) Test macro for a typed memory object.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
int    chmod(const char *, mode_t);
int    fchmod(int, mode_t);
int    fstat(int, struct stat *);
int    isfdtype(int, int);
int    lstat(const char *restrict, struct stat *restrict);
int    mkdir(const char *, mode_t);
int    mkfifo(const char *, mode_t);
XSI int    mknod(const char *, mode_t, dev_t);
int    stat(const char *restrict, struct stat *restrict);
mode_t umask(mode_t);
```

APPLICATION USAGE

Use of the macros is recommended for determining the type of a file.

RATIONALE

A conforming C-language application must include **<sys/stat.h>** for functions that have arguments or return values of type **mode_t**, so that symbolic values for that type can be used. An alternative would be to require that these constants are also defined by including **<sys/types.h>**.

The S_ISUID and S_ISGID bits may be cleared on any write, not just on *open*( ), as some historical implementations do it.

System calls that update the time entry fields in the **stat** structure must be documented by the implementors. POSIX-conforming systems should not update the time entry fields for functions listed in the System Interfaces volume of IEEE Std. 1003.1-200x unless the standard requires that they do, except in the case of documented extensions to the standard.

Note that *st_dev* must be unique within a Local Area Network (LAN) in a ''system'' made up of multiple computers' file systems connected by a LAN.

Networked implementations of a POSIX-conforming system must guarantee that all files visible within the file tree (including parts of the tree that may be remotely mounted from other machines on the network) on each individual processor are uniquely identified by the combination of the *st_ino* and *st_dev* fields.

FUTURE DIRECTIONS

None.

SEE ALSO

<sys/types.h>, the System Interfaces volume of IEEE Std. 1003.1-200x, *chmod*( ), *fchmod*( ), *fstat*( ), *lstat*( ), *mkdir*( ), *mkfifo*( ), *mknod*( ), *stat*( ), *umask*( )

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

Reference to the **<sys/types.h>** header is added for the definitions of **dev_t**, **ino_t**, **mode_t**, **nlink_t**, **uid_t**, **gid_t**, **off_t**, and **time_t**. This has been marked as an extension.

References to the S_IREAD, S_IWRITE, S_IEXEC file, and S_ISVTX modes are removed.

The descriptions of the members of the **stat** structure in the DESCRIPTION are corrected.

The following changes are incorporated for alignment with the ISO POSIX-1 standard:

- The function declarations in this header are expanded to full ISO C standard prototypes.
- The DESCRIPTION is expanded to include:
  - — How files are uniquely identified within the system
  - — Times are given in units of seconds since the Epoch
  - — Rules governing the definition and use of the file mode bits
  - — Usage of the file type test macros

Issue 4, Version 2

The following changes are incorporated for X/OPEN UNIX conformance:

- The *st_blksize* and *st_blocks* members are added to the **stat** structure.
- The S_IFLINK value of S_IFMT is defined.
- The S_ISVTX file mode bit and the S_ISLNK file type test macro is defined.
- The *fchmod*( ), *lstat*( ), and *mknod*( ) functions are added to the list of functions declared in this header.

Issue 5

The DESCRIPTION is updated for alignment with POSIX Realtime Extension.

The type of *st_blksize* is changed from **long** to **blksize_t**; the type of *st_blocks* is changed from **long** to **blkcnt_t**.

Issue 6

The S_TYPEISMQ( ), S_TYPEISSEM( ), and S_TYPEISSHM( ) macros are unconditionally mandated.

The Open Group corrigenda item U035/4 has been applied. In the DESCRIPTION, the types **blksize_t** and **blkcnt_t** have been described.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The **dev_t**, **ino_t**, **mode_t**, **nlink_t**, **uid_t**, **gid_t**, **off_t**, and **time_t** types are mandated.

The *isfdtype*( ) function, S_IFSOCK, and S_ISSOCK are added for sockets.

The description of **stat** structure members is changed to reflect contents when file type is a symbolic link.

The test macro S_TYPEISTMO is added for alignment with IEEE Std. 1003.1j-2000.

The **restrict** keyword is added to the prototypes for *lstat*( ) and *stat*( ).

NAME

sys/statvfs.h — VFS File System information structure

SYNOPSIS

XSI
```
#include <sys/statvfs.h>
```

DESCRIPTION

The **<sys/statvfs.h>** header shall define the **statvfs** structure that includes at least the following members:

`unsigned long f_bsize`	File system block size.
`unsigned long f_frsize`	Fundamental file system block size.
`fsblkcnt_t f_blocks`	Total number of blocks on file system in units of *f_frsize*.
`fsblkcnt_t f_bfree`	Total number of free blocks.
`fsblkcnt_t f_bavail`	Number of free blocks available to non-privileged process.
`fsfilcnt_t f_files`	Total number of file serial numbers.
`fsfilcnt_t f_ffree`	Total number of free file serial numbers.
`fsfilcnt_t f_favail`	Number of file serial numbers available to non-privileged process.
`unsigned long f_fsid`	File system ID.
`unsigned long f_flag`	Bit mask of *f_flag* values.
`unsigned long f_namemax`	Maximum file name length.

The **fsblkcnt_t** and **fsfilcnt_t** types shall be defined as described in **<sys/types.h>**.

The following flags for the *f_flag* member shall be defined:

`ST_RDONLY`	Read-only file system.
`ST_NOSUID`	Does not support setuid/setgid semantics.

The **<sys/statvfs.h>** header shall declare the following functions which may also be defined as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
int statvfs(const char *restrict, struct statvfs *restrict);
int fstatvfs(int, struct statvfs *);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<sys/types.h>, the System Interfaces volume of IEEE Std. 1003.1-200x, *fstatvfs*( ), *statvfs*( )

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

The type of *f_blocks*, *f_bfree*, and *f_bavail* is changed from **unsigned long** to **fsblkcnt_t**; the type of *f_files*, *f_ffree*, and *f_favail* is changed from **unsigned long** to **fsfilcnt_t**.

Issue 6

The Open Group corrigenda item U035/5 has been applied. In the DESCRIPTION, the types **fsblkcnt_t** and **fsfilcnt_t** have been described.

The **restrict** keyword is added to the prototype for *statvfs*().

13398 **NAME**

13399 sys/time.h — time types

13400 **SYNOPSIS**

13401 XSI
```
#include <sys/time.h>
```
13402

13403 **DESCRIPTION**

13404 The **<sys/time.h>** header shall define the **timeval** structure that includes at least the following
13405 members:

13406 `time_t` `tv_sec` Seconds.
13407 `suseconds_t` `tv_usec` Microseconds.

13408 The **<sys/time.h>** header shall define the **itimerval** structure that includes at least the following
13409 members:

13410 `struct timeval it_interval` Timer interval.
13411 `struct timeval it_value` Current value.

13412 The **time_t** and **suseconds_t** types shall be defined as described in **<sys/types.h>**.

13413 The **<sys/time.h>** header shall define the **fd_set** type as a structure that includes at least the
13414 following member:

13415 `long fds_bits[]` Bit mask for open file descriptions.

13416 The **<sys/time.h>** header shall define the following values for the *which* argument of *getitimer*( )
13417 and *setitimer*( ):

13418 ITIMER_REAL Decrements in real time.

13419 ITIMER_VIRTUAL Decrements in process virtual time.

13420 ITIMER_PROF Decrements both in process virtual time and when the system is running
13421 on behalf of the process.

13422 Each of the following may be declared as a function, or defined as a macro, or both:

13423 void FD_CLR(int *fd*, fd_set **fdset*)
13424 Clears the bit for the file descriptor *fd* in the file descriptor set *fdset*.

13425 int FD_ISSET(int *fd*, fd_set **fdset*)
13426 Returns a non-zero value if the bit for the file descriptor *fd* is set in the file descriptor set by
13427 *fdset*, and 0 otherwise.

13428 void FD_SET(int *fd*, fd_set **fdset*)
13429 Sets the bit for the file descriptor *fd* in the file descriptor set *fdset*.

13430 void FD_ZERO(fd_set **fdset*)
13431 Initializes the file descriptor set *fdset* to have zero bits for all file descriptors.

13432 FD_SETSIZE
13433 Maximum number of file descriptors in an **fd_set** structure.

13434 If implemented as macros, these may evaluate their arguments more than once, so that
13435 arguments must never be expressions with side effects.

13436 The following shall be declared as functions and may also be defined as macros. Function
13437 prototypes shall be provided for use with an ISO C standard compiler.

```
13438 int   getitimer(int, struct itimerval *);
13439 int   gettimeofday(struct timeval *, void *);
```

```
int   select(int, fd_set *restrict, fd_set *restrict, fd_set *restrict,
          struct timeval *restrict);
int   setitimer(int, const struct itimerval *restrict,
          struct itimerval *restrict);
int   utimes(const char *, const struct timeval [2]); (LEGACY)
```

Inclusion of the **<sys/time.h>** header may make visible all symbols from the **<sys/select.h>** header.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

The type of *tv_usec* is changed from **long** to **suseconds_t**.

Issue 6

The **restrict** keyword is added to the prototypes for *select*( ) and *setitimer*( ).

The note is added that inclusion of this header may also make symbols visible from **<sys_socket.h>**.

13464 **NAME**

13465 sys/timeb.h — additional definitions for date and time

13466 **SYNOPSIS**

13467 XSI
```
#include <sys/timeb.h>
```
13468

13469 **DESCRIPTION**

13470 The **<sys/timeb.h>** header shall define the **timeb** structure that includes at least the following
13471 members:

13472 `time_t`	`time`	The seconds portion of the current time.
13473 `unsigned short`	`millitm`	The milliseconds portion of the current time.
13474 `short`	`timezone`	The local timezone in minutes west of Greenwich.
13475 `short`	`dstflag`	TRUE if Daylight Savings Time is in effect.

13476 The **time_t** type shall be defined as described in **<sys/types.h>**.

13477 The **<sys/timeb.h>** header shall declare the following as a function which may also be defined as
13478 a macro. Function prototypes shall be provided for use with an ISO C standard compiler.

13492 **NAME**

13493 sys/times.h — file access and modification times structure

13494 **SYNOPSIS**

13495 `#include <sys/times.h>`

13496 **DESCRIPTION**

13497 The **<sys/times.h>** header shall define the structure **tms**, which is returned by *times*( ) and
13498 includes at least the following members:

13499 `clock_t tms_utime` User CPU time.
13500 `clock_t tms_stime` System CPU time.
13501 `clock_t tms_cutime` User CPU time of terminated child processes.
13502 `clock_t tms_cstime` System CPU time of terminated child processes.

13503 The **clock_t** type shall be defined as described in **<sys/types.h>**.

13504 The following shall be declared as a function and may also be defined as a macro. Function
13505 prototypes shall be provided for use with an ISO C standard compiler.

13506 `clock_t times(struct tms *);`

13507 **APPLICATION USAGE**

13508 None.

13513 **SEE ALSO**

13514 **<sys/types.h>**, the System Interfaces volume of IEEE Std. 1003.1-200x, *times*( )

13515 **CHANGE HISTORY**

13516 First released in Issue 1. Derived from Issue 1 of the SVID.

13517 **Issue 4**

13518 Reference to the **<sys/types.h>** header is added for the definitions of **clock_t**.

13519 This issue states that the *times*( ) function can also be defined as a macro.

13520 The following change is incorporated for alignment with the ISO POSIX-1 standard:

13521 - The function declarations in this header are expanded to full ISO C standard prototypes.

13522 **NAME**

13523 sys/types.h — data types

13524 **SYNOPSIS**

13525 `#include <sys/types.h>`

13526 **DESCRIPTION**

13527 The **<sys/types.h>** header shall include definitions for at least the following types:

13528	**blkcnt_t**	Used for file block counts.
13529	**blksize_t**	Used for block sizes.
13530 XSI	**clock_t**	Used for system times in clock ticks or CLOCKS_PER_SEC; see **<time.h>**.
13532 TMR	**clockid_t**	Used for clock ID type in the clock and timer functions.
13533	**dev_t**	Used for device IDs.
13534 XSI	**fsblkcnt_t**	Used for file system block counts.
13535 XSI	**fsfilcnt_t**	Used for file system file counts.
13536	**gid_t**	Used for group IDs.
13537 XSI	**id_t**	Used as a general identifier; can be used to contain at least a **pid_t**, **uid_t**, or **gid_t**.
13539	**ino_t**	Used for file serial numbers.
13540 XSI	**key_t**	Used for XSI interprocess communication.
13541	**mode_t**	Used for some file attributes.
13542	**nlink_t**	Used for link counts.
13543	**off_t**	Used for file sizes.
13544	**pid_t**	Used for process IDs and process group IDs.
13545 THR	**pthread_attr_t**	Used to identify a thread attribute object.
13546 BAR	**pthread_barrier_t**	Used to identify a barrier.
13547 BAR	**pthread_barrierattr_t**	Used to define a barrier attributes object.
13548 THR	**pthread_cond_t**	Used for condition variables.
13549 THR	**pthread_condattr_t**	Used to identify a condition attribute object.
13550 THR	**pthread_key_t**	Used for thread-specific data keys.
13551 THR	**pthread_mutex_t**	Used for mutexes.
13552 THR	**pthread_mutexattr_t**	Used to identify a mutex attribute object.
13553 THR	**pthread_once_t**	Used for dynamic package initialization.
13554 THR	**pthread_rwlock_t**	Used for read-write locks.
13555 THR	**pthread_rwlockattr_t**	Used for read-write lock attributes.
13556 SPI	**pthread_spinlock_t**	Used to identify a spin lock.
13557 THR	**pthread_t**	Used to identify a thread.

13558		**size_t**	Used for sizes of objects.
13559		**ssize_t**	Used for a count of bytes or an error indication.
13560	XSI	**suseconds_t**	Used for time in microseconds
13561		**time_t**	Used for time in seconds.
13562	TMR	**timer_t**	Used for timer ID returned by *timer_create*( ).
13563		**uid_t**	Used for user IDs.
13564	XSI	**useconds_t**	Used for time in microseconds.

All of the types shall be defined as arithmetic types of an appropriate length, with the following exceptions:

13567	XSI	**key_t**
13568	THR	**pthread_attr_t**
13569	BAR	**pthread_barrier_t**
13570		**pthread_barrierattr_t**
13571	THR	**pthread_cond_t**
13572		**pthread_condattr_t**
13573		**pthread_key_t**
13574		**pthread_mutex_t**
13575		**pthread_mutexattr_t**
13576		**pthread_once_t**
13577		**pthread_rwlock_t**
13578		**pthread_rwlockattr_t**
13579	SPI	**pthread_spinlock_t**
13580	TRC	**trace_attr_t**
13581		**trace_event_id_t**
13582	TRC TEF	**trace_event_set_t**
13583	TRC	**trace_id_t**
13584		

Additionally:

- **blkcnt_t** and **off_t** shall be signed integer types.
- **fsblkcnt_t**, **fsfilcnt_t**, and **ino_t** shall be defined as unsigned integer types.
- **size_t** shall be an unsigned integer type.
- **blksize_t**, **pid_t**, and **ssize_t** shall be signed integer types.

XSI The type **ssize_t** shall be capable of storing values at least in the range [–1, {SSIZE_MAX}]. The type **useconds_t** shall be an unsigned integer type capable of storing values at least in the range [0, 1 000 000]. The type **suseconds_t** shall be a signed integer type capable of storing values at least in the range [–1, 1 000 000].

There are no defined comparison or assignment operators for the following types:

13595	THR	**pthread_attr_t**
13596	BAR	**pthread_barrier_t**
13597		**pthread_barrierattr_t**
13598	THR	**pthread_cond_t**
13599		**pthread_condattr_t**
13600		**pthread_mutex_t**
13601		**pthread_mutexattr_t**

pthread_rwlock_t
pthread_rwlockattr_t
SPI **pthread_spinlock_t**
TRC **trace_attr_t**

APPLICATION USAGE

<time.h>

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The **clock_t** type is marked as an extension.

In the last paragraph of the DESCRIPTION, only the reference to type **key_t** is now marked as an extension.

The following changes are incorporated for alignment with the ISO POSIX-1 standard:

- The data type **ssize_t** is added.
- The DESCRIPTION is expanded to indicate the required arithmetic types.

Issue 4, Version 2

The **id_t** and **useconds_t** types are defined for X/OPEN UNIX conformance. The capability of the **useconds_t** type is described.

Issue 5

The **clockid_t** and **timer_t** types are defined for alignment with the POSIX Realtime Extension.

The types **blkcnt_t**, **blksize_t**, **fsblkcnt_t**, **fsfilcnt_t**, and **suseconds_t** are added.

Large File System extensions are added.

Updated for alignment with the POSIX Threads Extension.

Issue 6

The **pthread_barrier_t**, **pthread_barrierattr_t**, and **pthread_spinlock_t** types are added for alignment with IEEE Std. 1003.1j-2000.

The margin code is changed from XSI to THR for the **pthread_rwlock_t** and **pthread_rwlockattr_t** types as Read-Write Locks have been absorbed into the POSIX Threads option. The threads types are now marked THR.

13638 **NAME**

13639 sys/uio.h — definitions for vector I/O operations

13640 **SYNOPSIS**

13641 XSI
```
#include <sys/uio.h>
```
13642

13643 **DESCRIPTION**

13644 The **<sys/uio.h>** header shall define the **iovec** structure that includes at least the following
13645 members:

13646 `void *iov_base` Base address of a memory region for input or output.
13647 `size_t iov_len` The size of the memory pointed to by *iov_base*.

13648 The **<sys/uio.h>** header uses the **iovec** structure for scatter/gather I/O.

13649 The **ssize_t** and **size_t** types shall be defined as described in **<sys/types.h>**.

13650 The following shall be declared as functions and may also be defined as macros. Function
13651 prototypes shall be provided for use with an ISO C standard compiler.

```
13652 ssize_t readv(int, const struct iovec *, int);
13653 ssize_t writev(int, const struct iovec *, int);
```

13654 **APPLICATION USAGE**

13655 The implementation can put a limit on the number of scatter/gather elements which can be
13656 processed in one call. The symbol {IOV_MAX} defined in **<limits.h>** should always be used to
13657 learn about the limits instead of assuming a fixed value.

13658 **RATIONALE**

13659 Traditionally, the maximum number of scatter/gather elements the system can process in one
13660 call were descibed by the symbolic value {UIO_MAXIOV}. In IEEE Std. 1003.1-200x this value
13661 was replaced by the constant {IOV_MAX} which can be found in **<limits.h>**.

13662 **FUTURE DIRECTIONS**

13663 None.

13664 **SEE ALSO**

13665 **<limits.h>**, **<sys/types.h>**, the System Interfaces volume of IEEE Std. 1003.1-200x, *read*( ), *write*( )

13666 **CHANGE HISTORY**

13667 First released in Issue 4, Version 2.

13668 **Issue 6**

13669 Text referring to scatter/gather I/O is added to the DESCRIPTION.

13670 **NAME**

13671 sys/un.h — definitions for UNIX domain sockets

13672 **SYNOPSIS**

13673 `#include <sys/un.h>`

13674 **DESCRIPTION**

13675 The **<sys/un.h>** header shall define the **sockaddr_un** structure that includes at least the
13676 following members:

13677 `sa_family_t sun_family` Address family.
13678 `char sun_path[]` Socket path name.

13679 The **sockaddr_un** structure is used to store addresses for UNIX domain sockets. Values of this
13680 type shall be cast by applications to **struct sockaddr** for use with socket functions.

13681 The **sa_family_t** type shall be defined as described in **<sys/socket.h>**.

13682 **APPLICATION USAGE**

13683 The size of *sun_path* has intentionally been left undefined. This is because different
13684 implementations use different sizes. For example, BSD4.3 uses a size of 108, and BSD4.4 uses a
13685 size of 104. Since most implementations originate from BSD versions, the size is typically in the
13686 range 92 to 108.

13687 Applications should not assume a particular length for *sun_path* or assume that it can hold
13688 _POSIX_PATH_MAX characters (255).

13689 **RATIONALE**

13690 None.

13691 **FUTURE DIRECTIONS**

13692 None.

13693 **SEE ALSO**

13694 **<sys/socket.h>**, the System Interfaces volume of IEEE Std. 1003.1-200x, *bind*( ), *socket*( ),
13695 *socketpair*( )

13696 **CHANGE HISTORY**

13697 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

NAME

sys/utsname.h — system name structure

SYNOPSIS

```
#include <sys/utsname.h>
```

DESCRIPTION

The **<sys/utsname.h>** header shall define the structure **utsname** which shall include at least the following members:

`char`	`sysname[]`	Name of this implementation of the operating system.
`char`	`nodename[]`	Name of this node within an implementation-defined communications network.
`char`	`release[]`	Current release level of this implementation.
`char`	`version[]`	Current version level of this release.
`char`	`machine[]`	Name of the hardware type on which the system is running.

The character arrays are of unspecified size, but the data stored in them shall be terminated by a null byte.

The following shall be declared as a function and may also be defined as a macro:

```
int uname(struct utsname *);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The System Interfaces volume of IEEE Std. 1003.1-200x, *uname*( )

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The word ‘‘character’’ is replaced with the word ‘‘byte’’ in the DESCRIPTION.

The function in this header can now also be defined as a macro.

The following change is incorporated for alignment with the ISO C standard:

- The function declarations in this header are expanded to full ISO C standard prototypes.

13730 **NAME**

13731 sys/wait.h — declarations for waiting

13732 **SYNOPSIS**

13733 `#include <sys/wait.h>`

13734 **DESCRIPTION**

13735 The **<sys/wait.h>** header shall define the following symbolic constants for use with *waitpid*( ):

13736 WNOHANG Do not hang if no status is available; return immediately.

13737 WUNTRACED Report status of stopped child process.

13738 The **<sys/wait.h>** header shall define the following macros for analysis of process status values:

13739 WEXITSTATUS Return exit status.

13740 XSI WIFCONTINUED True if child has been continued

13741 WIFEXITED True if child exited normally.

13742 WIFSIGNALED True if child exited due to uncaught signal.

13743 WIFSTOPPED True if child is currently stopped.

13744 WSTOPSIG Return signal number that caused process to stop.

13745 WTERMSIG Return signal number that caused process to terminate.

13746 XSI The following symbolic constants shall be defined as possible values for the *options* argument to
13747 *waitid*( ):

13748 WEXITED Wait for processes that have exited.

13749 WSTOPPED Status is returned for any child that has stopped upon receipt of a signal.

13750 WCONTINUED Status is returned for any child that was stopped and has been continued.

13751 WNOHANG Return immediately if there are no children to wait for.

13752 WNOWAIT Keep the process whose status is returned in *infop* in a waitable state.

13753 The type **idtype_t** shall be defined as an enumeration type whose possible values shall include
13754 at least the following:

13755 P_ALL
13756 P_PID
13757 P_PGID

13758

13759 The **id_t** and **pid_t** types shall be defined as described in **<sys/types.h>**.

13760 XSI The **siginfo_t** type shall be defined as described in **<signal.h>**.

13761 The **rusage** structure shall be defined as described in **<sys/resource.h>**.

13762 Inclusion of the **<sys/wait.h>** header may also make visible all symbols from **<signal.h>** and
13763 **<sys/resource.h>**.

13764 The following shall be declared as functions and may also be defined as macros. Function
13765 prototypes shall be provided for use with an ISO C standard compiler.

13766 `pid_t  wait(int *);`
13767 XSI `int    waitid(idtype_t, id_t, siginfo_t *, int);`
13768 `pid_t  waitpid(pid_t, int *, int);`

13769 **APPLICATION USAGE**

13770 None.

13771 **RATIONALE**

13772 None.

13773 **FUTURE DIRECTIONS**

13774 None.

13775 **SEE ALSO**

13776 **<signal.h>**, **<sys/resource.h>**, **<sys/types.h>**, **<sys/wait.h>**, the System Interfaces volume of
13777 IEEE Std. 1003.1-200x, *wait*( ), *waitid*( )

13778 **CHANGE HISTORY**

13779 First released in Issue 3.

13780 Entry included for alignment with the POSIX.1-1988 standard.

13781 **Issue 4**

13782 Reference to the **<sys/types.h>** header is added for the definition of **pid_t** and marked as an
13783 extension.

13784 The following change is incorporated for alignment with the ISO POSIX-1 standard:

13785 • The function declarations in this header are expanded to full ISO C standard prototypes.

13786 **Issue 4, Version 2**

13787 The following changes are incorporated for X/OPEN UNIX conformance:

13788 • The WIFCONTINUED macro, the list of symbolic constants for the *options* argument to
13789 *waitid*( ), and the description of the **idtype_t** enumeration type are added.

13790 • A statement is added indicated that inclusion of this header may also make visible constants
13791 from **<signal.h>** and **<sys/resource.h>**.

13792 • The *wait3*( ) and *waitid*( ) functions are added to the list of functions declared in this header.

13793 **Issue 6**

13794 The *wait3*( ) function is removed.

13795 **NAME**

13796 syslog — definitions for system error logging

13797 **SYNOPSIS**

13798 XSI
```
#include <syslog.h>
```
13799

13800 **DESCRIPTION**

13801 The **<syslog.h>** header shall define the following symbolic constants, zero or more of which may
13802 be OR'ed together to form the *logopt* option of *openlog*( ):

13803 LOG_PID Log the process ID with each message.

13804 LOG_CONS Log to the system console on error.

13805 LOG_NDELAY Connect to syslog daemon immediately.

13806 LOG_ODELAY Delay open until *syslog*( ) is called.

13807 LOG_NOWAIT Do not wait for child processes.

13808 The following symbolic constants shall be defined as possible values of the *facility* argument to
13809 *openlog*( ):

13810 LOG_KERN Reserved for message generated by the system.

13811 LOG_USER Message generated by a process.

13812 LOG_MAIL Reserved for message generated by mail system.

13813 LOG_NEWS Reserved for message generated by news system.

13814 LOG_UUCP Reserved for message generated by UUCP system.

13815 LOG_DAEMON Reserved for message generated by system daemon.

13816 LOG_AUTH Reserved for message generated by authorization daemon.

13817 LOG_CRON Reserved for message generated by the clock daemon.

13818 LOG_LPR Reserved for message generated by printer system.

13819 LOG_LOCAL0 Reserved for local use.

13820 LOG_LOCAL1 Reserved for local use.

13821 LOG_LOCAL2 Reserved for local use.

13822 LOG_LOCAL3 Reserved for local use.

13823 LOG_LOCAL4 Reserved for local use.

13824 LOG_LOCAL5 Reserved for local use.

13825 LOG_LOCAL6 Reserved for local use.

13826 LOG_LOCAL7 Reserved for local use.

13827 The following shall be declared as macros for constructing the *maskpri* argument to *setlogmask*( ).
13828 The following macros expand to an expression of type **int** when the argument *pri* is an
13829 expression of type **int**:

13830 LOG_MASK(*pri*) A mask for priority *pri*.

13831 The following constants shall be defined as possible values for the *priority* argument of *syslog*( ):

LOG_EMERG	A panic condition was reported to all processes.
LOG_ALERT	A condition that should be corrected immediately.
LOG_CRIT	A critical condition.
LOG_ERR	An error message.
LOG_WARNING	A warning message.
LOG_NOTICE	A condition requiring special handling.
LOG_INFO	A general information message.
LOG_DEBUG	A message useful for debugging programs.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
void  closelog(void);
void  openlog(const char *, int, int);
int   setlogmask(int);
void  syslog(int, const char *, ...);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved to X/Open UNIX to BASE.

13858 **NAME**

13859 tar.h — extended tar definitions

13860 **SYNOPSIS**

13861
```
#include <tar.h>
```

13862 **DESCRIPTION**

13863 The **<tar.h>** header shall define header block definitions as follows.

13864 General definitions:

13865

13866

Name	Description	Value
13867 TMAGIC	"ustar"	ustar plus null byte.
13868 TMAGLEN	6	Length of the above.
13869 TVERSION	"00"	00 without a null byte.
13870 TVERSLEN	2	Length of the above.

13871 *Typeflag* field definitions:

13872

13873

Name	Description	Value
13874 REGTYPE	'0'	Regular file.
13875 AREGTYPE	'\0'	Regular file.
13876 LNKTYPE	'1'	Link.
13877 SYMTYPE	'2'	Symbolic link.
13878 CHRTYPE	'3'	Character special.
13879 BLKTYPE	'4'	Block special.
13880 DIRTYPE	'5'	Directory.
13881 FIFOTYPE	'6'	FIFO special.
13882 CONTTYPE	'7'	Reserved.

13883 *Mode* field bit definitions (octal):

13884

13885

Name	Description	Value
13886 TSUID	04000	Set UID on execution.
13887 TSGID	02000	Set GID on execution.
13888 XSI TSVTX	01000	On directories, restricted deletion flag.
13889 TUREAD	00400	Read by owner.
13890 TUWRITE	00200	Write by owner special.
13891 TUEXEC	00100	Execute/search by owner.
13892 TGREAD	00040	Read by group.
13893 TGWRITE	00020	Write by group.
13894 TGEXEC	00010	Execute/search by group.
13895 TOREAD	00004	Read by other.
13896 TOWRITE	00002	Write by other.
13897 TOEXEC	00001	Execute/search by other.

13898 **APPLICATION USAGE**

13899 None.

13900 **RATIONALE**

13901 None.

13902 **FUTURE DIRECTIONS**

13903 None.

13904 **SEE ALSO**

13905 The Shell and Utilities volume of IEEE Std. 1003.1-200x, *pax*

13906 **CHANGE HISTORY**

13907 First released in Issue 3. Derived from the entry in the POSIX.1-1988 standard.

13908 **Issue 4**

13909 This entry is moved from the Headers Interface, Issue 3 specification.

13910 **Issue 4, Version 2**

13911 The following changes are incorporated for X/OPEN UNIX conformance:

13912 • The significance of SYMTYPE as the value of the *typeflag* field is explained.

13913 • The value of TSVTX as the value of the *mode* field is explained.

13914 **Issue 6**

13915 The SEE ALSO section now refers to *pax* since the Shell and Utilities volume of
13916 IEEE Std. 1003.1-200x no longer contains the *tar* utility.

13917 **NAME**

13918 termios.h — define values for termios

13919 **SYNOPSIS**

13920 `#include <termios.h>`

13921 **DESCRIPTION**

13922 The **<termios.h>** header contains the definitions used by the terminal I/O interfaces (see
13923 Chapter 11 (on page 213) for the structures and names defined).

13924 **The termios Structure**

13925 The following data types shall be defined through **typedef**:

13926 **cc_t** Used for terminal special characters.

13927 **speed_t** Used for terminal baud rates.

13928 **tcflag_t** Used for terminal modes.

13929 The above types shall be all unsigned integer types.

13930 The **termios** structure shall be defined, and shall include at least the following members:

13931 `tcflag_t c_iflag` Input modes.
13932 `tcflag_t c_oflag` Output modes.
13933 `tcflag_t c_cflag` Control modes.
13934 `tcflag_t c_lflag` Local modes.
13935 `cc_t c_cc[NCCS]` Control characters.

13936 A definition shall be provided for:

13937 NCCS Size of the array *c_cc* for control characters.

13938 The following subscript names for the array *c_cc* shall be defined:

13939
13940
13941

Subscript Usage		
Canonical Mode	**Non-Canonical Mode**	**Description**
13942 VEOF		EOF character.
13943 VEOL		EOL character.
13944 VERASE		ERASE character.
13945 VINTR	VINTR	INTR character.
13946 VKILL		KILL character.
13947	VMIN	MIN value.
13948 VQUIT	VQUIT	QUIT character.
13949 VSTART	VSTART	START character.
13950 VSTOP	VSTOP	STOP character.
13951 VSUSP	VSUSP	SUSP character.
13952	VTIME	TIME value.

13953 The subscript values shall be unique, except that the VMIN and VTIME subscripts may have the
13954 same values as the VEOF and VEOL subscripts, respectively.

13955 The following flags shall be provided.

Input Modes

The *c_iflag* field describes the basic terminal input control:

BRKINT	Signal interrupt on break.
ICRNL	Map CR to NL on input.
IGNBRK	Ignore break condition.
IGNCR	Ignore CR.
IGNPAR	Ignore characters with parity errors.
INLCR	Map NL to CR on input.
INPCK	Enable input parity check.
ISTRIP	Strip character.
XSI IXANY	Enable any character to restart output.
IXOFF	Enable start/stop input control.
IXON	Enable start/stop output control.
PARMRK	Mark parity errors.

Output Modes

The *c_oflag* field specifies the system treatment of output:

OPOST	Post-process output.
XSI ONLCR	Map NL to CR-NL on output.
OCRNL	Map CR to NL on output.
ONOCR	No CR output at column 0.
ONLRET	NL performs CR function.
OFILL	Use fill characters for delay.
NLDLY	Select newline delays:
	NL0	<newline> character type 0.
	NL1	<newline> character type 1.
CRDLY	Select carriage-return delays:
	CR0	Carriage-return delay type 0.
	CR1	Carriage-return delay type 1.
	CR2	Carriage-return delay type 2.
	CR3	Carriage-return delay type 3.
TABDLY	Select horizontal-tab delays:
	TAB0	Horizontal-tab delay type 0.
	TAB1	Horizontal-tab delay type 1.
	TAB2	Horizontal-tab delay type 2.

	TAB3	Expand tabs to spaces.
BSDLY	Select backspace delays:	
	BS0	Backspace-delay type 0.
	BS1	Backspace-delay type 1.
VTDLY	Select vertical-tab delays:	
	VT0	Vertical-tab delay type 0.
	VT1	Vertical-tab delay type 1.
FFDLY	Select form-feed delays:	
	FF0	Form-feed delay type 0.
	FF1	Form-feed delay type 1.

Baud Rate Selection

The input and output baud rates are stored in the **termios** structure. These are the valid values for objects of type **speed_t**. The following values shall be defined, but not all baud rates need be supported by the underlying hardware.

B0	Hang up
B50	50 baud
B75	75 baud
B110	110 baud
B134	134.5 baud
B150	150 baud
B200	200 baud
B300	300 baud
B600	600 baud
B1200	1200 baud
B1800	1800 baud
B2400	2400 baud
B4800	4800 baud
B9600	9600 baud
B19200	19200 baud
B38400	38400 baud

14020 **Control Modes**

14021 The *c_cflag* field describes the hardware control of the terminal; not all values specified are
14022 required to be supported by the underlying hardware:

14023	CSIZE	Character size:
14024		CS5 5 bits
14025		CS6 6 bits
14026		CS7 7 bits
14027		CS8 8 bits
14028	CSTOPB	Send two stop bits, else one.
14029	CREAD	Enable receiver.
14030	PARENB	Parity enable.
14031	PARODD	Odd parity, else even.
14032	HUPCL	Hang up on last close.
14033	CLOCAL	Ignore modem status lines.

14034 **Local Modes**

14035 The *c_lflag* field of the argument structure is used to control various terminal functions:

14036	ECHO	Enable echo.
14037	ECHOE	Echo erase character as error-correcting backspace.
14038	ECHOK	Echo KILL.
14039	ECHONL	Echo NL.
14040	ICANON	Canonical input (erase and kill processing).
14041	IEXTEN	Enable extended input character processing.
14042	ISIG	Enable signals.
14043	NOFLSH	Disable flush after interrupt or quit.
14044	TOSTOP	Send SIGTTOU for background output.

14045 **Attribute Selection**

14046 The following symbolic constants for use with *tcsetattr*( ) are defined:

14047	TCSANOW	Change attributes immediately.
14048	TCSADRAIN	Change attributes when output has drained.
14049	TCSAFLUSH	Change attributes when output has drained; also flush pending input.

14050 **Line Control**

14051 The following symbolic constants for use with *tcflush*( ) shall be defined:

14052 TCIFLUSH Flush pending input. Flush untransmitted output.

14053 TCIOFLUSH Flush both pending input and untransmitted output.

14054 TCOFLUSH Flush untransmitted output.

14055 The following symbolic constants for use with *tcflow*( ) shall be defined:

14056 TCIOFF Transmit a STOP character, intended to suspend input data.

14057 TCION Transmit a START character, intended to restart input data.

14058 TCOOFF Suspend output.

14059 TCOON Restart output.

14060 The following shall be declared as functions and may also be defined as macros. Function
14061 prototypes shall be provided for use with an ISO C standard compiler.

```
14062 speed_t cfgetispeed(const struct termios *);
14063 speed_t cfgetospeed(const struct termios *);
14064 int     cfsetispeed(struct termios *, speed_t);
14065 int     cfsetospeed(struct termios *, speed_t);
14066 int     tcdrain(int);
14067 int     tcflow(int, int);
14068 int     tcflush(int, int);
14069 int     tcgetattr(int, struct termios *);
14070 XSI pid_t   tcgetsid(int);
14071 int     tcsendbreak(int, int);
14072 int     tcsetattr(int, int, struct termios *);
```

14073 **APPLICATION USAGE**

14074 The following names are commonly used as extensions to the above, therefore portable
14075 applications must not use them:

14076 XSI

CBAUD	EXTB	VDSUSP
DEFECHO	FLUSHO	VLNEXT
ECHOCTL	LOBLK	VREPRINT
ECHOKE	PENDIN	VSTATUS
ECHOPRT	SWTCH	VWERASE
EXTA	VDISCARD	

14082 **Note:** These names are not used in IEEE Std. 1003.1-200x, but are reserved for historical use.

14083 **RATIONALE**

14084 None.

14085 **FUTURE DIRECTIONS**

14086 None.

14087 **SEE ALSO**

14088 The System Interfaces volume of IEEE Std. 1003.1-200x, *cfgetispeed*( ), *cfgetospeed*( ), *cfsetispeed*( ),

14090 11 (on page 213)

14091 **CHANGE HISTORY**

14092 First released in Issue 3.

14093 Entry included for alignment with the ISO POSIX-1 standard.

14094 **Issue 4**

14095 The following words are removed from the description of the *c_cc* array: ‘‘Implementations that
14096 do not support the job control option, may ignore the SUSP character value in the *c_cc* array
14097 indexed by the VSUSP subscript.’’ This is because job control is defined as mandatory for Issue 4
14098 conforming implementations.

14099 The mask name symbols IUCLC and OLCUC are marked LEGACY.

14100 The following changes are incorporated for alignment with the ISO POSIX-1 standard:

14101 • The function declarations in this header are expanded to full ISO C standard prototypes.

14102 • Some minor rewording of the DESCRIPTION is done to align the text more exactly with the
14103 ISO POSIX-1 standard. No functional differences are implied by these changes.

14104 • The list of mask name symbols for the *c_oflag* field have all been marked as extensions, with
14105 the exception of OPOST.

14106 **Issue 4, Version 2**

14107 For X/OPEN UNIX conformance, the *tcgetsid*( ) function is added to the list of functions declared
14108 in this header.

14109 **Issue 6**

14110 The LEGACY symbols IUCLC, ULCUC, and XCASE are removed.

NAME

tgmath.h — type-generic macros

SYNOPSIS

```
#include <tgmath.h>
```

DESCRIPTION

CX The functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of symbols in this header.

The **<tgmath.h>** header shall include the headers **<math.h>** and **<complex.h>** and shall define several type-generic macros.

Of the functions contained within the **<math.h>** and **<complex.h>** headers without an *f* (**float**) or *l* (**long double**) suffix, several have one or more parameters whose corresponding real type is **double**. For each such function, except *modf*( ), there shall be a corresponding type-generic macro. The parameters whose corresponding real type is **double** in the function synopsis are generic parameters. Use of the macro invokes a function whose corresponding real type and type domain are determined by the arguments for the generic parameters.

Use of the macro invokes a function whose generic parameters have the corresponding real type determined as follows:

- First, if any argument for generic parameters has type **long double**, the type determined is **long double**.
- Otherwise, if any argument for generic parameters has type **double** or is of integer type, the type determined is **double**.
- Otherwise, the type determined is **float**.

For each unsuffixed function in the **<math.h>** header for which there is a function in the **<complex.h>** header with the same name except for a *c* prefix, the corresponding type-generic macro (for both functions) has the same name as the function in the **<math.h>** header. The corresponding type-generic macro for *fabs*( ) and *cabs*( ) is *fabs*( ).

<math.h> Function	**<complex.h> Function**	**Type-Generic Macro**
acos( )	*cacos*( )	*acos*( )
asin( )	*casin*( )	*asin*( )
atan( )	*catan*( )	*atan*( )
acosh( )	*cacosh*( )	*acosh*( )
asinh( )	*casinh*( )	*asinh*( )
atanh( )	*catanh*( )	*atanh*( )
cos( )	*ccos*( )	*cos*( )
sin( )	*csin*( )	*sin*( )
tan( )	*ctan*( )	*tan*( )
cosh( )	*ccosh*( )	*cosh*( )
sinh( )	*csinh*( )	*sinh*( )
tanh( )	*ctanh*( )	*tanh*( )
exp( )	*cexp*( )	*exp*( )
log( )	*clog*( )	*log*( )
pow( )	*cpow*( )	*pow*( )
sqrt( )	*csqrt*( )	*sqrt*( )
fabs( )	*cabs*( )	*fabs*( )

If at least one argument for a generic parameter is complex, then use of the macro invokes a complex function; otherwise, use of the macro invokes a real function.

For each unsuffixed function in the **<math.h>** header without a *c*-prefixed counterpart in the **<complex.h>** header, the corresponding type-generic macro has the same name as the function. These type-generic macros are:

atan2( )	*fma*( )	*llround*( )	*remainder*( )
cbrt( )	*fmax*( )	*log10*( )	*remquo*( )
ceil( )	*fmin*( )	*log1p*( )	*rint*( )
copysign( )	*fmod*( )	*log2*( )	*round*( )
erf( )	*frexp*( )	*logb*( )	*scalbn*( )
erfc( )	*hypot*( )	*lrint*( )	*scalbln*( )
exp2( )	*ilogb*( )	*lround*( )	*tgamma*( )
expm1( )	*ldexp*( )	*nearbyint*( )	*trunc*( )
fdim( )	*lgamma*( )	*nextafter*( )	
floor( )	*llrint*( )	*nexttoward*( )	

If all arguments for generic parameters are real, then use of the macro invokes a real function; otherwise, use of the macro results in undefined behavior.

For each unsuffixed function in the **<complex.h>** header that is not a *c*-prefixed counterpart to a function in the **<math.h>** header, the corresponding type-generic macro has the same name as the function. These type-generic macros are:

carg( )
cimag( )
conj( )
cproj( )
creal( )

Use of the macro with any real or complex argument invokes a complex function.

APPLICATION USAGE

With the declarations:

```
#include <tgmath.h>
int n;
float f;
double d;
long double ld;
float complex fc;
double complex dc;
long double complex ldc;
```

functions invoked by use of type-generic macros are shown in the following table:

Macro	Use Invokes
exp(*n*)	*exp*(*n*), the function
acosh(*f*)	*acoshf*(*f*)
sin(*d*)	*sin*(*d*), the function
atan(*ld*)	*atanl*(*ld*)
log(*fc*)	*clogf*(*fc*)
sqrt(*dc*)	*csqrt*(*dc*)
pow(*ldc*,*f*)	*cpowl*(*ldc*, *f*)
remainder(*n*,*n*)	*remainder*(*n*, *n*), the function
nextafter(*d*,*f*)	*nextafter*(*d*, *f*), the function
nexttoward(*f*,*ld*)	*nexttowardf*(*f*, *ld*)
copysign(*n*,*ld*)	*copysignl*(*n*, *ld*)
ceil(*fc*)	Undefined behavior
rint(*dc*)	Undefined behavior
fmax(*ldc*,*ld*)	Undefined behavior
carg(*n*)	*carg*(*n*), the function
cproj(*f*)	*cprojf*(*f*)
creal(*d*)	*creal*(*d*), the function
cimag(*ld*)	*cimagl*(*ld*)
cabs(*fc*)	*cabsf*(*fc*)
carg(*dc*)	*carg*(*dc*), the function
cproj(*ldc*)	*cprojl*(*ldc*)

RATIONALE

Type-generic macros allow calling a function whose type is determined by the argument type, as is the case for C operators such as `'+'` and `'*'`. For example, with a type-generic *cos*( ) macro, the expression *cos*((**float**)*x*) will have type **float**. This feature enables writing more portably efficient code and alleviates need for awkward casting and suffixing in the process of porting or adjusting precision. Generic math functions are a widely appreciated feature of Fortran.

The only arguments that affect the type resolution are the arguments corresponding to the parameters that have type **double** in the synopsis. Hence the type of a type-generic call to *nexttoward*( ), whose second parameter is **long double** in the synopsis, is determined solely by the type of the first argument.

The term ‘‘type-generic’’ was chosen over the proposed alternatives of intrinsic and overloading. The term is more specific than intrinsic, which already is widely used with a more general meaning, and reflects a closer match to Fortran’s generic functions than to C++ overloading.

The macros are placed in their own header in order not to silently break old programs that include the **<math.h>** header; for example, with:

```
printf ("%e", sin(x))
```

modf(**double**, **double***) is excluded because no way was seen to make it safe without complicating the type resolution.

The implementation might, as an extension, endow appropriate ones of the macros that IEEE Std. 1003.1-200x specifies only for real arguments with the ability to invoke the complex functions.

IEEE Std. 1003.1-200x does not prescribe any particular implementation mechanism for generic macros. It could be implemented simply with built-in macros. The generic macro for *sqrt*( ), for example, could be implemented with:

```
#undef sqrt
#define sqrt(x) __BUILTIN_GENERIC_sqrt(x)
```

Generic macros are designed for a useful level of consistency with C++ overloaded math functions.

The great majority of existing C programs are expected to be unaffected when the **<tgmath.h>** header is included instead of the **<math.h>** or **<complex.h>** headers. Generic macros are similar to the ISO / IEC 9899: 1999 standard library masking macros, though the semantic types of return values differ.

The ability to overload on integer as well as floating types would have been useful for some functions; for example, *copysign*( ). Overloading with different numbers of arguments would have allowed reusing names; for example, *remainder*( ) for *remquo*( ). However, these facilities would have complicated the specification; and their natural consistent use, such as for a floating *abs*( ) or a two-argument *atan*( ), would have introduced further inconsistencies with the ISO / IEC 9899: 1999 standard for insufficient benefit.

The ISO C standard in no way limits the implementation's options for efficiency, including inlining library functions.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Included for alignment with the ISO / IEC 9899: 1999 standard.

14265 **NAME**

14266 time.h — time types

14267 **SYNOPSIS**

14268 `#include <time.h>`

14269 **DESCRIPTION**

14270 CX The functionality described on this reference page extends the ISO C standard. Applications
14271 shall define the appropriate feature test macro (see the System Interfaces volume of
14272 IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of
14273 symbols in this header.

14274 The **<time.h>** header shall declare the structure **tm**, which shall include at least the following
14275 members:

14276 `int tm_sec` Seconds [0,60].
14277 `int tm_min` Minutes [0,59].
14278 `int tm_hour` Hour [0,23].
14279 `int tm_mday` Day of month [1,31].
14280 `int tm_mon` Month of year [0,11].
14281 `int tm_year` Years since 1900.
14282 `int tm_wday` Day of week [0,6] (Sunday =0).
14283 `int tm_yday` Day of year [0,365].
14284 `int tm_isdst` Daylight savings flag.

14285 The value of *tm_isdst* shall be positive if Daylight Saving Time is in effect, 0 if Daylight Saving
14286 Time is not in effect, and negative if the information is not available.

14287 The **<time.h>** header shall define the following symbolic names:

14288 NULL Null pointer constant.

14289 CLOCKS_PER_SEC A number used to convert the value returned by the *clock*( ) function into
14290 seconds.

14291 TMR|CPT CLOCK_PROCESS_CPUTIME_ID
14292 The identifier of the CPU-time clock associated with the process making a
14293 *clock*( ) or *timer**( ) function call.

14294 TMR|TCT CLOCK_THREAD_CPUTIME_ID
14295 The identifier of the CPU-time clock associated with the thread making a
14296 *clock*( ) or *timer**( ) function call.

14297 TMR The **<time.h>** header shall declare the structure **timespec**, which has at least the following
14298 members:

14299 `time_t tv_sec` Seconds.
14300 `long tv_nsec` Nanoseconds.

14301 The **<time.h>** header shall also declare the **itimerspec** structure, which has at least the following
14302 members:

14303 `struct timespec it_interval` Timer period.
14304 `struct timespec it_value` Timer expiration.

14305 The following manifest constants shall be defined:

14306 CLOCK_REALTIME The identifier of the system-wide realtime clock.

14307 TIMER_ABSTIME Flag indicating time is absolute with respect to the clock associated with a
14308 timer.

14309 MON CLOCK_MONOTONIC
14310 The identifier for the system-wide monotonic clock, which is defined as a
14311 clock whose value cannot be set via *clock_settime*() and which cannot
14312 have backward clock jumps. The maximum possible clock jump shall be
14313 implementation-defined.

14314 TMR The **clock_t**, **size_t**, **time_t**, **clockid_t**, and **timer_t** types shall be defined as described in
14315 **<sys/types.h>**.

14316 XSI Although the value of CLOCKS_PER_SEC is required to be 1 million on all XSI-conformant
14317 systems, it may be variable on other systems, and it should not be assumed that
14318 CLOCKS_PER_SEC is a compile-time constant.

14319 XSI The **<time.h>** header shall provide a declaration for *getdate_err*.

14320 The following shall be declared as functions and may also be defined as macros. Function
14321 prototypes shall be provided for use with an ISO C standard compiler.

```
14322 char      *asctime(const struct tm *);
14323 TSF char  *asctime_r(const struct tm *restrict, char *restrict);
14324 clock_t    clock(void);
14325 CPT int    clock_getcpuclockid(pid_t, clockid_t *);
14326 TMR int    clock_getres(clockid_t, struct timespec *);
14327 int        clock_gettime(clockid_t, struct timespec *);
14328 CS int     clock_nanosleep(clockid_t, int, const struct timespec *,
14329                struct timespec *);
14330 TMR int    clock_settime(clockid_t, const struct timespec *);
14331 char      *ctime(const time_t *);
14332 TSF char  *ctime_r(const time_t *, char *);
14333 double     difftime(time_t, time_t);
14334 XSI struct tm *getdate(const char *);
14335 struct tm *gmtime(const time_t *);
14336 struct tm *gmtime_r(const time_t *restrict, struct tm *restrict);
14337 struct tm *localtime(const time_t *);
14338 TSF struct tm *localtime_r(const time_t *restrict, struct tm *restrict);
14339 time_t     mktime(struct tm *);
14340 TMR int    nanosleep(const struct timespec *, struct timespec *);
14341 size_t     strftime(char *restrict, size_t, const char *restrict,
14342                const struct tm *restrict);
14343 XSI char  *strptime(const char *restrict, const char *restrict,
14344                struct tm *restrict);
14345 time_t     time(time_t *);
14346 TMR int    timer_create(clockid_t, struct sigevent *restrict,
14347                timer_t *restrict);
14348 int        timer_delete(timer_t);
14349 int        timer_gettime(timer_t, struct itimerspec *);
14350 int        timer_getoverrun(timer_t);
14351 int        timer_settime(timer_t, int, const struct itimerspec *restrict,
14352                struct itimerspec *restrict);
14353 void       tzset(void);
```

14354 The following shall be declared as variables:

```
14355 XSI extern int    daylight;
14356 extern long   timezone;
14357 extern char  *tzname[];
```

14358 **APPLICATION USAGE**

14359 The range [0,61] for *tm_sec* allows for the occasional leap second or double leap second.

14360 *tm_year* is a signed value; therefore, years before 1900 may be represented.

14361 To obtain the number of clock ticks per second returned by the *times*( ) function, applications
14362 should call *sysconf*(_SC_CLK_TCK).

14363 **RATIONALE**

14364 None.

14365 **FUTURE DIRECTIONS**

14366 None.

14372 IEEE Std. 1003.1-200x, *daylight*, *timezone* |

14373 **CHANGE HISTORY**

14374 First released in Issue 1. Derived from Issue 1 of the SVID. |

14375 **Issue 4**

14376 The symbolic name CLK_TCK is marked as an extension and LEGACY. Warnings about its use
14377 are also added to the DESCRIPTION.

14378 Reference to the **<sys/types.h>** header is added for the definitions of **clock_t**, **size_t**, and **time_t**.

14379 References to CLK_TCK are changed to CLOCKS_PER_SEC in part of the DESCRIPTION. The
14380 fact that CLOCKS_PER_SEC is always one millionth of a second on XSI-conformant systems is
14381 also marked as an extension.

14382 External declarations for *daylight*, *timezone*, and *tzname* are added. The first two are marked as
14383 extensions.

14384 The *strptime*( ) function is added to the list of functions declared in this header.

14385 A note about the settings of *tm_sec* is added to the APPLICATION USAGE section.

14386 The following changes are incorporated for alignment with the ISO C standard:

14387 - The function declarations in this header are expanded to full ISO C standard prototypes.
14388 - The range of *tm_min* is changed from [0,61] to [0,59].
14389 - Possible settings of *tm_isdst* and their meanings are added.
14390 - The *clock*( ) and *difftime*( ) functions are added to the list of functions declared in this header.

14391 **Issue 4, Version 2**

14392 The following changes are incorporated for X/OPEN UNIX conformance:

14393 - The **<time.h>** header provides a declaration for *getdate_err*.
14394 - The *getdate*( ) function is added to the list of functions declared in this header.

14395 **Issue 5**

14396 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
14397 Threads Extension.

Issue 6

The Open Group corrigenda item U035/6 has been applied. In the DESCRIPTION, the types **clockid_t** and **timer_t** have been described.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The POSIX timer-related functions are now marked as part of the Timers option.

The symbolic name CLK_TCK is removed. Application usage is added describing how its equivalent functionality can be obtained using *sysconf*( ).

The *clock_getcpuclockid*( ) function and manifest constants CLOCK_PROCESS_CPUTIME_ID and CLOCK_THREAD_CPUTIME_ID are added for alignment with IEEE Std. 1003.1d-1999.

The manifest constant CLOCK_MONOTONIC and the *clock_nanosleep*( ) function are added for alignment with IEEE Std. 1003.1j-2000.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The range for seconds is changed from 0,61 to 0.60.
- The **restrict** keyword is added to the prototypes for *asctime_r*( ), *gmtime_r*( ), *localtime_r*( ), *strftime*( ), *strptime*( ), *timer_create*( ), and *timer_settime*( ).

NAME

trace.h — tracing

SYNOPSIS

TRC
```
#include <tracing.h>
```

DESCRIPTION

The **<trace.h>** header shall define the **posix_trace_event_info** structure that includes at least the following members:

```
trace_event_id_t  posix_event_id
pid_t             posix_pid
void             *posix_prog_address
int               posix_truncation_status
struct timespec   posix_timestamp
```
THR
```
pthread_t         posix_thread_id
```

The **<trace.h>** header shall define the **posix_trace_status_info** structure that includes at least the following members:

```
int     posix_stream_status
int     posix_stream_full_status
int     posix_stream_overrun_status
```
TRL
```
int     posix_stream_flush_status
int     posix_stream_flush_error
int     posix_log_overrun_status
int     posix_log_full_status
```

The **<trace.h>** header shall define the following symbols:

POSIX_TRACE_RUNNING
POSIX_TRACE_SUSPENDED
POSIX_TRACE_FULL
POSIX_TRACE_NOT_FULL
POSIX_TRACE_NO_OVERRUN
POSIX_TRACE_OVERRUN
TRL
POSIX_TRACE_FLUSHING
POSIX_TRACE_NOT_FLUSHING
POSIX_TRACE_NOT_TRUNCATED
POSIX_TRACE_TRUNCATED_READ
POSIX_TRACE_TRUNCATED_RECORD
TRL
POSIX_TRACE_FLUSH
POSIX_TRACE_LOOP
POSIX_TRACE_UNTIL_FULL
TRI
POSIX_TRACE_CLOSE_FOR_CHILD
POSIX_TRACE_INHERITED
TRL
POSIX_TRACE_APPEND
POSIX_TRACE_LOOP
POSIX_TRACE_UNTIL_FULL
TEF
POSIX_TRACE_FILTER
TRL
POSIX_TRACE_FLUSH_START
POSIX_TRACE_FLUSH_STOP
POSIX_TRACE_OVERFLOW

POSIX_TRACE_RESUME
POSIX_TRACE_START
POSIX_TRACE_STOP
POSIX_TRACE_UNNAMED_USER_EVENT

The following types shall be defined as described in **<sys/types.h>**:

trace_attr_t
trace_id_t
trace_event_set_t

The following shall be declared as functions and may also be declared as macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
int  posix_trace_attr_destroy(trace_attr_t *);
int  posix_trace_attr_getclockres(const trace_attr_t *,
         struct timespec *);
int  posix_trace_attr_getcreatetime(const trace_attr_t *,
         struct timespec *);
int  posix_trace_attr_getgenversion(const trace_attr_t *, char *);
int  posix_trace_attr_getinherited(const trace_attr_t *, int *);
int  posix_trace_attr_getlogfullpolicy(const trace_attr_t *, int *);
int  posix_trace_attr_getlogsize(const trace_attr_t *, size_t *);
int  posix_trace_attr_getmaxdatasize(const trace_attr_t *, size_t *);
int  posix_trace_attr_getmaxsystemeventsize(const trace_attr_t *,
         size_t *);
int  posix_trace_attr_getmaxusereventsize(const trace_attr_t *,
         size_t, size_t *);
int  posix_trace_attr_getname(const trace_attr_t *, char *);
int  posix_trace_attr_getstreamfullpolicy(const trace_attr_t *, int *);
int  posix_trace_attr_getstreamsize(const trace_attr_t *, size_t *);
int  posix_trace_attr_init(trace_attr_t *);
int  posix_trace_attr_setinherited(trace_attr_t *, int);
int  posix_trace_attr_setlogfullpolicy(trace_attr_t *, int);
int  posix_trace_attr_setlogsize(trace_attr_t *, size_t);
int  posix_trace_attr_setmaxdatasize(trace_attr_t *, size_t);
int  posix_trace_attr_setname(trace_attr_t *, const char *);
int  posix_trace_attr_setstreamsize(trace_attr_t *, size_t);
int  posix_trace_attr_setstreamfullpolicy(trace_attr_t *, int);
int  posix_trace_clear(trace_id_t);
int  posix_trace_close(trace_id_t);
int  posix_trace_create(pid_t, const trace_attr_t *, trace_id_t *);
int  posix_trace_create_withlog(pid_t, const trace_attr_t *, int,
         trace_id_t *);
void posix_trace_event(trace_event_id_t, const void *, size_t);
int  posix_trace_eventid_equal(trace_id_t, trace_eventid_t,
         trace_eventid_t);
int  posix_trace_eventid_get_name(trace_id_t, trace_eventid_t, char *);
int  posix_trace_eventid_open(const char *, trace_event_id_t *);
int  posix_trace_eventtypelist_getnext_id(trace_id_t, trace_eventid_t *,
         int *);
int  posix_trace_eventtypelist_rewind(trace_id_t);
```

```
14512 TEF       int  posix_trace_eventset_add(trace_event_id_t, trace_event_set_t *);
14513           int  posix_trace_eventset_del(trace_event_id_t, trace_event_set_t *);
14514           int  posix_trace_eventset_empty(trace_event_set_t *);
14515           int  posix_trace_eventset_fill(trace_event_set_t *, int);
14516           int  posix_trace_eventset_ismember(trace_event_id_t,
14517                    const trace_event_set_t *, int *);
14518           int  posix_trace_flush(trace_id_t);
14519           int  posix_trace_get_attr(trace_id_t, trace_attr_t *);
14520 TEF       int  posix_trace_get_filter(trace_id_t, trace_event_set_t *);
14521           int  posix_trace_get_status(trace_id_t,
14522                    struct posix_trace_status_info *);
14523           int  posix_trace_getnext_event(trace_id_t,
14524                    struct posix_trace_event_info *, void *, size_t, size_t *,
14525                    int *);
14526 TRL       int  posix_trace_open(int, trace_id_t *);
14527           int  posix_trace_rewind(trace_id_t);
14528 TEF       int  posix_trace_set_filter(trace_id_t, const trace_event_set_t *, int);
14529           int  posix_trace_shutdown(trace_id_t);
14530           int  posix_trace_start(trace_id_t);
14531           int  posix_trace_stop(trace_id_t);
14532 TMO       int  posix_trace_timedgetnext_event(trace_id_t,
14533                    struct posix_trace_event_info *, void *, size_t, size_t *,
14534                    int *, const struct timespec *);
14535 TEF       int  posix_trace_trid_eventid_open(trace_id_t, const char *,
14536                    trace_eventid_t *);
14537           int  posix_trace_trygetnext_event(trace_id_t,
14538                    struct posix_trace_event_info *, void *, size_t, size_t *,
14539                    int *);

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std. 1003.1q-2000.

NAME

ucontext.h — user context

SYNOPSIS

XSI
```
#include <ucontext.h>
```

DESCRIPTION

The **<ucontext.h>** header shall define the **mcontext_t** type through **typedef**.

The **<ucontext.h>** header shall define the **ucontext_t** type as a structure that shall include at least the following members:

`ucontext_t *uc_link`		Pointer to the context that is resumed when this context returns.
`sigset_t`	`uc_sigmask`	The set of signals that are blocked when this context is active.
`stack_t`	`uc_stack`	The stack used by this context.
`mcontext_t`	`uc_mcontext`	A machine-specific representation of the saved context.

The types **sigset_t** and **stack_t** shall be defined as in **<signal.h>**.

The following shall be declared as functions and may also be defined as macros, Function prototypes shall be provided for use with an ISO C standard compiler.

```
int  getcontext(ucontext_t *);
int  setcontext(const ucontext_t *);
void makecontext(ucontext_t *, void (*)(void), int, ...);
int  swapcontext(ucontext_t *restrict, const ucontext_t *restrict);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

14601 **NAME**

14602 ulimit.h — ulimit commands

14603 **SYNOPSIS**

14604 XSI
```
#include <ulimit.h>
```
14605

14606 **DESCRIPTION**

14607 The **<ulimit.h>** header shall define the symbolic constants used by the *ulimit*( ) function.

14608 Symbolic constants:

14609 UL_GETFSIZE Get maximum file size.

14610 UL_SETFSIZE Set maximum file size.

14611 The following shall be declared as a function and may also be defined as a macro. Function
14612 prototypes shall be provided for use with an ISO C standard compiler.

14613
```
long ulimit(int, ...);
```

14614 **APPLICATION USAGE**

14615 None.

14616 **RATIONALE**

14617 None.

14618 **FUTURE DIRECTIONS**

14619 None.

14620 **SEE ALSO**

14621 The System Interfaces volume of IEEE Std. 1003.1-200x, *ulimit*( )

14622 **CHANGE HISTORY**

14623 First released in Issue 3.

14624 **Issue 4**

14625 The function declarations in this header are expanded to full ISO C standard prototypes.

14626 **NAME**

14627 unistd.h — standard symbolic constants and types

14628 **SYNOPSIS**

14629 `#include <unistd.h>`

14630 **DESCRIPTION**

14631 The **<unistd.h>** header defines miscellaneous symbolic constants and types, and declares
14632 miscellaneous functions. The actual value of the constants are unspecified except as shown. The
14633 contents of this header are shown below.

14634 **Version Test Macros**

14635 The following symbolic constants shall be defined:

14636 _POSIX_VERSION
14637 Integer value indicating version of IEEE Std. 1003.1-200x (C-language binding). The value is
14638 200xxxL. This value shall be used for systems that conform to IEEE Std. 1003.1-200x.

14639 _POSIX2_VERSION
14640 Integer value indicating version of the Shell and Utilities volume of IEEE Std. 1003.1-200x.

14641 XSI _XOPEN_VERSION
14642 Integer value indicating version of the X/Open Portability Guide to which the
14643 implementation conforms. The value is 600.

14644 XSI _XOPEN_XCU_VERSION is defined as an integer value indicating the version of the Shell and
14645 Utilities volume of IEEE Std. 1003.1-200x to which the implementation conforms. If the value is
14646 –1, no commands and utilities are provided on the implementation. If the value is greater than
14647 or equal to 4, the functionality associated with the following symbols is also supported (see
14648 **Constants for Options and Option Groups** (on page 438) and **Constants for Profiling Option**
14649 **Groups** (on page 444)):

14650 _POSIX2_C_BIND
14651 _POSIX2_CHAR_TERM
14652 _POSIX2_LOCALEDEF
14653 _POSIX2_UPE
14654 _POSIX2_VERSION

14655 If _XOPEN_XCU_VERSION is not defined, use the *sysconf*( ) function to determine which
14656 features are supported.

14657 Each of the following symbolic constants shall be defined only if the implementation supports
14658 the indicated version of the X/Open Portability Guide:

14659 XSI _XOPEN_UNIX
14660 X/Open CAE Specification, January 1997, System Interfaces and Headers, Issue 5
14661 (ISBN: 1-85912-181-0, C606).

14662 _XOPEN_XPG2
14663 X/Open Portability Guide, Volume 2, January 1987, XVS System Calls and Libraries
14664 (ISBN: 0-444-70175-3).

14665 _XOPEN_XPG3
14666 X/Open Specification, February 1992, System Interfaces and Headers, Issue 3
14667 (ISBN: 1-872630-37-5, C212); this specification was formerly X/Open Portability Guide,
14668 Issue 3, Volume 2, January 1989, XSI System Interface and Headers (ISBN: 0-13-685843-0,
14669 XO/XPG/89/003).

14670 _XOPEN_XPG4
14671 X/Open CAE Specification, July 1992, System Interfaces and Headers, Issue 4
14672 (ISBN: 1-872630-47-2, C202).

14673 **Constants for Options and Option Groups**

14674 The following symbolic constants, if defined in **<unistd.h>**, shall have a value of –1, 0, or greater,
14675 unless otherwise specified below. If these are undefined, the *sysconf*( ) function can be used to
14676 determine whether the option is provided for a particular invocation of the application.

14677 If a symbolic constant is defined with the value –1, the option is not supported. Headers, data
14678 types, and function interfaces required only for the option need not be supplied. An application
14679 that attempts to use anything associated only with the option is considered to be requiring an
14680 extension.

14681 If a symbolic constant is defined with a value greater than zero, the option shall always be
14682 supported when the application is executed. All headers, data types, and functions shall be
14683 present and shall operate as specified.

14684 If a symbolic constant is defined with the value zero, all headers, data types, and functions shall
14685 be present. The application must check at runtime to see whether the option is supported by
14686 calling *sysconf*( ) with the indicated *name* parameter.

14687 Unless explicitly specified otherwise, the behavior of functions associated with an unsupported
14688 option is unspecified, and an application that uses such functions without first checking
14689 *sysconf*( ) is considered to be requiring an extension.

14690 For conformance requirements, refer to Chapter 2 (on page 19).

14691 ADV _POSIX_ADVISORY_INFO
14692 The implementation supports the Advisory Information option. If this symbol has a value
14693 other than –1, it shall have the value 200ymmL, the date of approval of
14694 IEEE Std. 1003.1-200x.

14695 AIO _POSIX_ASYNCHRONOUS_IO
14696 The implementation supports the Asynchronous Input and Output option. If this symbol
14697 has a value other than –1, it shall have the value 200ymmL, the date of approval of
14698 IEEE Std. 1003.1-200x.

14699 BAR _POSIX_BARRIERS
14700 The implementation supports the Barriers option. If this symbol has a value other than –1, it
14701 shall have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

14702 _POSIX_CHOWN_RESTRICTED
14703 The use of *chown*( ) and *fchown*( ) is restricted to a process with appropriate privileges, and
14704 to changing the group ID of a file only to the effective group ID of the process or to one of
14705 its supplementary group IDs.

14706 CS _POSIX_CLOCK_SELECTION
14707 The implementation supports the Clock Selection option. If this symbol has a value other
14708 than –1, it shall have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

14709 CPT _POSIX_CPUTIME
14710 The implementation supports the Process CPU-Time Clocks option. If this symbol has a
14711 value other than –1, it shall have the value 200ymmL, the date of approval of
14712 IEEE Std. 1003.1-200x.

14713 FSC _POSIX_FSYNC
14714 The implementation supports the File Synchronization option. If this symbol has a value

other than –1, it shall have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

_POSIX_JOB_CONTROL
The implementation supports job control. This is always set to a value greater than zero.

MF _POSIX_MAPPED_FILES
The implementation supports the Memory Mapped Files option. If this symbol has a value other than –1, it shall have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

ML _POSIX_MEMLOCK
The implementation supports the Process Memory Locking option. If this symbol has a value other than –1, it shall have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

MLR _POSIX_MEMLOCK_RANGE
The implementation supports the Range Memory Locking option. If this symbol has a value other than –1, it shall have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

MPR _POSIX_MEMORY_PROTECTION
The implementation supports the Memory Protection option. If this symbol has a value other than –1, it shall have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

MSG _POSIX_MESSAGE_PASSING
The implementation supports the Message Passing option. If this symbol has a value other than –1, it shall have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

MON _POSIX_MONOTONIC_CLOCK
The implementation supports the Monotonic Clock option. If this symbol has a value other than –1, it shall have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

_POSIX_NO_TRUNC
Path name components longer than {NAME_MAX} generate an error.

PIO _POSIX_PRIORITIZED_IO
The implementation supports the Prioritized Input and Output option. If this symbol has a value other than –1, it shall have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

PS _POSIX_PRIORITY_SCHEDULING
The implementation supports the Process Scheduling option. If this symbol has a value other than –1, it shall have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

THR _POSIX_READER_WRITER_LOCKS
The implementation supports the Read-Write Locks option. This is always set to a value greater than zero if the Threads option is supported. If this symbol has a value other than –1, it shall have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

RTS _POSIX_REALTIME_SIGNALS
The implementation supports the Realtime Signals Extension option. If this symbol has a value other than –1, it shall have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

_POSIX_REGEXP
The implementation supports the Regular Expression Handling option. This is always set

14761 to a value greater than zero.

14762 _POSIX_SAVED_IDS
14763 Each process has a saved set-user-ID and a saved set-group-ID. The behavior of the *setuid*( ),
14764 *setgid*( ), and *kill*( ) functions shall be dependent on the values of the saved set-user-ID and
14765 the saved get-group-ID, respectively. This is always set to a value greater than zero.

14766 SEM _POSIX_SEMAPHORES
14767 The implementation supports the Semaphores option. If this symbol has a value other than
14768 −1, it shall have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

14769 SHM _POSIX_SHARED_MEMORY_OBJECTS
14770 The implementation supports the Shared Memory Objects option. If this symbol has a value
14771 other than −1, it shall have the value 200ymmL, the date of approval of
14772 IEEE Std. 1003.1-200x.

14773 SH _POSIX_SHELL
14774 The implementation supports the POSIX shell. This is always set to a value greater than
14775 zero.

14776 SPN _POSIX_SPAWN
14777 The implementation supports the Spawn option. If this symbol has a value other than −1, it
14778 shall have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

14779 SPI _POSIX_SPIN_LOCKS
14780 The implementation supports the Spin Locks option. If this symbol has a value other than
14781 −1, it shall have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

14782 SS _POSIX_SPORADIC_SERVER
14783 The implementation supports the Process Sporadic Server option. If this symbol has a value
14784 other than −1, it shall have the value 200ymmL, the date of approval of
14785 IEEE Std. 1003.1-200x.

14786 SIO _POSIX_SYNCHRONIZED_IO
14787 The implementation supports the Synchronized Input and Output option. If this symbol
14788 has a value other than −1, it shall have the value 200ymmL, the date of approval of
14789 IEEE Std. 1003.1-200x.

14790 TSA _POSIX_THREAD_ATTR_STACKADDR
14791 The implementation supports the Thread Stack Address Attribute option. If this symbol
14792 has a value other than −1, it shall have the value 200ymmL, the date of approval of
14793 IEEE Std. 1003.1-200x.

14794 TSS _POSIX_THREAD_ATTR_STACKSIZE
14795 The implementation supports the Thread Stack Address Size option. If this symbol has a
14796 value other than −1, it shall have the value 200ymmL, the date of approval of
14797 IEEE Std. 1003.1-200x.

14798 TCT _POSIX_THREAD_CPUTIME
14799 The implementation supports the Thread CPU-Time Clocks option. If this symbol has a
14800 value other than −1, it shall have the value 200ymmL, the date of approval of
14801 IEEE Std. 1003.1-200x.

14802 TPI _POSIX_THREAD_PRIO_INHERIT
14803 The implementation supports the Threads Priority Inheritance option. If this symbol has a
14804 value other than −1, it shall have the value 200ymmL, the date of approval of
14805 IEEE Std. 1003.1-200x.

14806 TPP _POSIX_THREAD_PRIO_PROTECT
14807 The implementation supports the Thread Priority Protection option. If this symbol has a
14808 value other than −1, it shall have the value 200ymmL, the date of approval of
14809 IEEE Std. 1003.1-200x.

14810 TPS _POSIX_THREAD_PRIORITY_SCHEDULING
14811 The implementation supports the Thread Execution Scheduling option. If this symbol has a
14812 value other than −1, it shall have the value 200ymmL, the date of approval of
14813 IEEE Std. 1003.1-200x.

14814 TSH _POSIX_THREAD_PROCESS_SHARED
14815 The implementation supports the Thread Process-Shared Synchronization option. If this
14816 symbol has a value other than −1, it shall have the value 200ymmL, the date of approval of
14817 IEEE Std. 1003.1-200x.

14818 TSF _POSIX_THREAD_SAFE_FUNCTIONS
14819 The implementation supports the Thread-Safe Functions option. If this symbol has a value
14820 other than −1, it shall have the value 200ymmL, the date of approval of
14821 IEEE Std. 1003.1-200x.

14822 TSP _POSIX_THREAD_SPORADIC_SERVER
14823 The implementation supports the Thread Sporadic Server option. If this symbol has a value
14824 other than −1, it shall have the value 200ymmL, the date of approval of
14825 IEEE Std. 1003.1-200x.

14826 THR _POSIX_THREADS
14827 The implementation supports the Threads option. If this symbol has a value other than −1, it
14828 shall have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

14829 TMR _POSIX_TIMERS
14830 The implementation supports the Timers option. If this symbol has a value other than −1, it
14831 shall have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

14832 TMO _POSIX_TIMEOUTS
14833 The implementation supports the Timeouts option. If this symbol has a value other than −1,
14834 it shall have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

14835 TRC _POSIX_TRACE
14836 The implementation supports the Trace option.

14837 TEF _POSIX_TRACE_EVENT_FILTER
14838 The implementation supports the Trace Event Filter option.

14839 TRL _POSIX_TRACE_LOG
14840 The implementation supports the Trace Log option.

14841 TRI _POSIX_TRACE_INHERIT
14842 The implementation supports the Trace Inherit option.

14843 TYM _POSIX_TYPED_MEMORY_OBJECTS
14844 The implementation supports the Typed Memory Objects option. If this symbol has a value
14845 other than −1, it shall have the value 200ymmL, the date of approval of
14846 IEEE Std. 1003.1-200x.

14847 _POSIX_VDISABLE
14848 Terminal special characters defined in **<termios.h>** can be disabled using this character
14849 value.

14850 _POSIX2_C_BIND
14851 The implementation supports the C-Language Binding option. This always has the value
14852 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

14853 CD _POSIX2_C_DEV
14854 The implementation supports the C-Language Development Utilities option. If this symbol
14855 has a value other than –1, it shall have the value 200ymmL, the date of approval of
14856 IEEE Std. 1003.1-200x.

14857 _POSIX2_CHAR_TERM
14858 The implementation supports at least one terminal type.

14859 FD _POSIX2_FORT_DEV
14860 The implementation supports the FORTRAN Development Utilities option. If this symbol
14861 has a value other than –1, it shall have the value 200ymmL, the date of approval of
14862 IEEE Std. 1003.1-200x.

14863 FR _POSIX2_FORT_RUN
14864 The implementation supports the FORTRAN Runtime Utilities option. If this symbol has a
14865 value other than –1, it shall have the value 200ymmL, the date of approval of
14866 IEEE Std. 1003.1-200x.

14867 _POSIX2_LOCALEDEF
14868 The implementation supports the creation of locales by the *localedef* utility. If this symbol
14869 has a value other than –1, it shall have the value 200ymmL, the date of approval of
14870 IEEE Std. 1003.1-200x.

14871 BE _POSIX2_PBS
14872 The implementation supports the Batch Environment Services and Utilities option. If this
14873 symbol has a value other than –1, it shall have the value 200ymmL, the date of approval of
14874 IEEE Std. 1003.1-200x.

14875 BE _POSIX2_PBS_ACCOUNTING
14876 The implementation supports the Batch Accounting option. If this symbol has a value other
14877 than –1, it shall have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

14878 BE _POSIX2_PBS_CHECKPOINT
14879 The implementation supports the Batch Checkpoint/Restart option. If this symbol has a
14880 value other than –1, it shall have the value 200ymmL, the date of approval of
14881 IEEE Std. 1003.1-200x.

14882 BE _POSIX2_PBS_LOCATE
14883 The implementation supports the Locate Batch Job Request option. If this symbol has a
14884 value other than –1, it shall have the value 200ymmL, the date of approval of
14885 IEEE Std. 1003.1-200x.

14886 BE _POSIX2_PBS_MESSAGE
14887 The implementation supports the Batch Job Message Request option. If this symbol has a
14888 value other than –1, it shall have the value 200ymmL, the date of approval of
14889 IEEE Std. 1003.1-200x.

14890 BE _POSIX2_PBS_TRACK
14891 The implementation supports the Track Batch Job Request option. If this symbol has a value
14892 other than –1, it shall have the value 200ymmL, the date of approval of
14893 IEEE Std. 1003.1-200x.

14894 SD _POSIX2_SW_DEV
14895 The implementation supports the Software Development Utilities option. If this symbol has

a value other than –1, it shall have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

UP _POSIX2_UPE
The implementation supports the User Portability Utilities option. If this symbol has a value other than –1, it shall have the value 200ymmL, the date of approval of IEEE Std. 1003.1-200x.

_V6_ILP32_OFF32
The implementation provides a C-language compilation environment with 32-bit **int**, **long**, **pointer**, and **off_t** types.

_V6_ILP32_OFFBIG
The implementation provides a C-language compilation environment with 32-bit **int**, **long**, and **pointer** types and an **off_t** type using at least 64 bits.

_V6_LP64_OFF64
The implementation provides a C-language compilation environment with 32-bit **int** and 64-bit **long**, **pointer**, and **off_t** types.

_V6_LPBIG_OFFBIG
The implementation provides a C-language compilation environment with an **int** type using at least 32 bits and **long**, **pointer**, and **off_t** types using at least 64 bits.

XSI _XBS5_ILP32_OFF32 (**LEGACY**)
The implementation provides a C-language compilation environment with 32-bit **int**, **long**, **pointer**, and **off_t** types.

XSI _XBS5_ILP32_OFFBIG (**LEGACY**)
The implementation provides a C-language compilation environment with 32-bit **int**, **long**, and **pointer** types and an **off_t** type using at least 64 bits.

XSI _XBS5_LP64_OFF64 (**LEGACY**)
The implementation provides a C-language compilation environment with 32-bit **int** and 64-bit **long**, **pointer**, and **off_t** types.

XSI _XBS5_LPBIG_OFFBIG (**LEGACY**)
The implementation provides a C-language compilation environment with an **int** type using at least 32 bits and **long**, **pointer**, and **off_t** types using at least 64 bits.

XSI _XOPEN_CRYPT
The implementation supports the X/Open Encryption Option Group.

_XOPEN_ENH_I18N
The implementation supports the Issue 4, Version 2 Enhanced Internationalization Option Group. This is always set to a value other than –1.

_XOPEN_LEGACY
The implementation supports the Legacy Option Group.

_XOPEN_REALTIME
The implementation supports the X/Open Realtime Option Group.

_XOPEN_REALTIME_THREADS
The implementation supports the X/Open Realtime Threads Option Group.

_XOPEN_SHM
The implementation supports the Issue 4, Version 2 Shared Memory Option Group. This is always set to a value other than –1.

14940 _XOPEN_STREAMS
14941 The implementation supports the XSI STREAMS Option Group.

14942 **Constants for Profiling Option Groups**

14943 The following symbolic constants shall be defined to have the value –1 if the implementation
14944 never provides the Profiling Option Group, and to have a value other than –1 if the
14945 implementation always provides the Profiling Option Group. If these are undefined, the
14946 *sysconf*( ) function can be used to determine whether the Profiling Option Group is provided for
14947 a particular invocation of the application.

14948 For conformance requirements, refer to Chapter 2 (on page 19).

14970 **Execution-Time Symbolic Constants**

14971 If any of the following constants are not defined in the **<unistd.h>** header, the value shall vary
14972 depending on the file to which it is applied.

14973 If any of the following constants are defined to have value –1 in the **<unistd.h>** header, the
14974 implementation shall not provide the option on any file; if any are defined to have a value other
14975 than –1 in the **<unistd.h>** header, the implementation shall provide the option on all applicable
14976 files.

All of the following constants, whether defined in **<unistd.h>** or not, may be queried with respect to a specific file using the *pathconf*( ) or *fpathconf*( ) functions:

_POSIX_ASYNC_IO
: Asynchronous input or output operations may be performed for the associated file.

_POSIX_PRIO_IO
: Prioritized input or output operations may be performed for the associated file.

_POSIX_SYNC_IO
: Synchronized input or output operations may be performed for the associated file.

Constants for Functions

The following symbolic constant shall be defined:

NULL Null pointer

The following symbolic constants shall be defined for the *access*( ) function:

F_OK Test for existence of file.

R_OK Test for read permission.

W_OK Test for write permission.

X_OK Test for execute (search) permission.

The constants F_OK, R_OK, W_OK, and X_OK and the expressions *R_OK* | *W_OK*, *R_OK* | *X_OK*, and *R_OK* | *W_OK* | *X_OK* shall all have distinct values.

The following symbolic constants shall be defined for the *confstr*( ) function:

_CS_PATH
: This is the value for the *PATH* environment variable that finds all standard utilities.

_CS_V6_ILP32_OFF32_CFLAGS
: If *sysconf*(_SC_V6_ILP32_OFF32) returns –1, the meaning of this value is unspecified. Otherwise, this value is the set of initial options to be given to the *cc* and *c99* utilities to build an application using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

_CS_V6_ILP32_OFF32_LDFLAGS
: If *sysconf*(_SC_V6_ILP32_OFF32) returns –1, the meaning of this value is unspecified. Otherwise, this value is the set of final options to be given to the *cc* and *c99* utilities to build an application using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

_CS_V6_ILP32_OFF32_LIBS
: If *sysconf*(_SC_V6_ILP32_OFF32) returns –1, the meaning of this value is unspecified. Otherwise, this value is the set of libraries to be given to the *cc* and *c99* utilities to build an application using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

_CS_V6_ILP32_OFF32_LINTFLAGS
: If *sysconf*(_SC_V6_ILP32_OFF32) returns –1, the meaning of this value is unspecified. Otherwise, this value is the set of options to be given to the *lint* utility to check application source using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

_CS_V6_ILP32_OFFBIG_CFLAGS
: If *sysconf*(_SC_V6_ILP32_OFFBIG) returns –1, the meaning of this value is unspecified. Otherwise, this value is the set of initial options to be given to the *cc* and *c99* utilities to build an application using a programming model with 32-bit **int**, **long**, and **pointer** types,

and an **off_t** type using at least 64 bits.

_CS_V6_ILP32_OFFBIG_LDFLAGS

If *sysconf*(_SC_V6_ILP32_OFFBIG) returns –1, the meaning of this value is unspecified. Otherwise, this value is the set of final options to be given to the *cc* and *c99* utilities to build an application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an **off_t** type using at least 64 bits.

_CS_V6_ILP32_OFFBIG_LIBS

If *sysconf*(_SC_V6_ILP32_OFFBIG) returns –1, the meaning of this value is unspecified. Otherwise, this value is the set of libraries to be given to the *cc* and *c99* utilities to build an application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an **off_t** type using at least 64 bits.

_CS_V6_ILP32_OFFBIG_LINTFLAGS

If *sysconf*(_SC_V6_ILP32_OFFBIG) returns –1, the meaning of this value is unspecified. Otherwise, this value is the set of options to be given to the *lint* utility to check an application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an **off_t** type using at least 64 bits.

_CS_V6_LP64_OFF64_CFLAGS

If *sysconf*(_SC_V6_LP64_OFF64) returns –1, the meaning of this value is unspecified. Otherwise, this value is the set of initial options to be given to the *cc* and *c99* utilities to build an application using a programming model with 64-bit **int**, **long**, **pointer**, and **off_t** types.

_CS_V6_LP64_OFF64_LDFLAGS

If *sysconf*(_SC_V6_LP64_OFF64) returns –1, the meaning of this value is unspecified. Otherwise, this value is the set of final options to be given to the *cc* and *c99* utilities to build an application using a programming model with 64-bit **int**, **long**, **pointer**, and **off_t** types.

_CS_V6_LP64_OFF64_LIBS

If *sysconf*(_SC_V6_LP64_OFF64) returns –1, the meaning of this value is unspecified. Otherwise, this value is the set of libraries to be given to the *cc* and *c99* utilities to build an application using a programming model with 64-bit **int**, **long**, **pointer**, and **off_t** types.

_CS_V6_LP64_OFF64_LINTFLAGS

If *sysconf*(_SC_V6_LP64_OFF64) returns –1, the meaning of this value is unspecified. Otherwise, this value is the set of options to be given to the *lint* utility to check application source using a programming model with 64-bit **int**, **long**, **pointer**, and **off_t** types.

_CS_V6_LPBIG_OFFBIG_CFLAGS

If *sysconf*(_SC_V6_LPBIG_OFFBIG) returns –1, the meaning of this value is unspecified. Otherwise, this value is the set of initial options to be given to the *cc* and *c99* utilities to build an application using a programming model with an **int** type using at least 32 bits and **long**, **pointer**, and **off_t** types using at least 64 bits.

_CS_V6_LPBIG_OFFBIG_LDFLAGS

If *sysconf*(_SC_V6_LPBIG_OFFBIG) returns –1, the meaning of this value is unspecified. Otherwise, this value is the set of final options to be given to the *cc* and *c99* utilities to build an application using a programming model with an **int** type using at least 32 bits and **long**, **pointer**, and **off_t** types using at least 64 bits.

_CS_V6_LPBIG_OFFBIG_LIBS

If *sysconf*(_SC_V6_LPBIG_OFFBIG) returns –1, the meaning of this value is unspecified. Otherwise, this value is the set of libraries to be given to the *cc* and *c99* utilities to build an application using a programming model with an **int** type using at least 32 bits and **long**,

15066 **pointer**, and **off_t** types using at least 64 bits.

15067 _CS_V6_LPBIG_OFFBIG_LINTFLAGS
15068 If *sysconf*(_SC_V6_LPBIG_OFFBIG) returns –1, the meaning of this value is unspecified.
15069 Otherwise, this value is the set of options to be given to the *lint* utility to check application
15070 source using a programming model with an **int** type using at least 32 bits and **long**, **pointer**,
15071 and **off_t** types using at least 64 bits.

15072 XSI _CS_XBS5_ILP32_OFF32_CFLAGS (**LEGACY**)
15073 If *sysconf*(_SC_XBS5_ILP32_OFF32) returns –1, the meaning of this value is unspecified.
15074 Otherwise, this value is the set of initial options to be given to the *cc* and *c99* utilities to
15075 build an application using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t**
15076 types.

15077 XSI _CS_XBS5_ILP32_OFF32_LDFLAGS (**LEGACY**)
15078 If *sysconf*(_SC_XBS5_ILP32_OFF32) returns –1, the meaning of this value is unspecified.
15079 Otherwise, this value is the set of final options to be given to the *cc* and *c99* utilities to build
15080 an application using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

15081 XSI _CS_XBS5_ILP32_OFF32_LIBS (**LEGACY**)
15082 If *sysconf*(_SC_XBS5_ILP32_OFF32) returns –1, the meaning of this value is unspecified.
15083 Otherwise, this value is the set of libraries to be given to the *cc* and *c99* utilities to build an
15084 application using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

15085 XSI _CS_XBS5_ILP32_OFF32_LINTFLAGS (**LEGACY**)
15086 If *sysconf*(_SC_XBS5_ILP32_OFF32) returns –1, the meaning of this value is unspecified.
15087 Otherwise, this value is the set of options to be given to the *lint* utility to check application
15088 source using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

15089 XSI _CS_XBS5_ILP32_OFFBIG_CFLAGS (**LEGACY**)
15090 If *sysconf*(_SC_XBS5_ILP32_OFFBIG) returns –1, the meaning of this value is unspecified.
15091 Otherwise, this value is the set of initial options to be given to the *cc* and *c99* utilities to
15092 build an application using a programming model with 32-bit **int**, **long**, and **pointer** types,
15093 and an **off_t** type using at least 64 bits.

15094 XSI _CS_XBS5_ILP32_OFFBIG_LDFLAGS (**LEGACY**)
15095 If *sysconf*(_SC_XBS5_ILP32_OFFBIG) returns –1, the meaning of this value is unspecified.
15096 Otherwise, this value is the set of final options to be given to the *cc* and *c99* utilities to build
15097 an application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an
15098 **off_t** type using at least 64 bits.

15099 XSI _CS_XBS5_ILP32_OFFBIG_LIBS (**LEGACY**)
15100 If *sysconf*(_SC_XBS5_ILP32_OFFBIG) returns –1, the meaning of this value is unspecified.
15101 Otherwise, this value is the set of libraries to be given to the *cc* and *c99* utilities to build an
15102 application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an
15103 **off_t** type using at least 64 bits.

15104 XSI _CS_XBS5_ILP32_OFFBIG_LINTFLAGS (**LEGACY**)
15105 If *sysconf*(_SC_XBS5_ILP32_OFFBIG) returns –1, the meaning of this value is unspecified.
15106 Otherwise, this value is the set of options to be given to the *lint* utility to check an
15107 application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an
15108 **off_t** type using at least 64 bits.

15109 XSI _CS_XBS5_LP64_OFF64_CFLAGS (**LEGACY**)
15110 If *sysconf*(_SC_XBS5_LP64_OFF64) returns –1, the meaning of this value is unspecified.
15111 Otherwise, this value is the set of initial options to be given to the *cc* and *c99* utilities to
15112 build an application using a programming model with 64-bit **int**, **long**, **pointer**, and **off_t**

types.

XSI _CS_XBS5_LP64_OFF64_LDFLAGS (**LEGACY**)
If *sysconf*(_SC_XBS5_LP64_OFF64) returns –1, the meaning of this value is unspecified. Otherwise, this value is the set of final options to be given to the *cc* and *c99* utilities to build an application using a programming model with 64-bit **int**, **long**, **pointer**, and **off_t** types.

XSI _CS_XBS5_LP64_OFF64_LIBS (**LEGACY**)
If *sysconf*(_SC_XBS5_LP64_OFF64) returns –1, the meaning of this value is unspecified. Otherwise, this value is the set of libraries to be given to the *cc* and *c99* utilities to build an application using a programming model with 64-bit **int**, **long**, **pointer**, and **off_t** types.

XSI _CS_XBS5_LP64_OFF64_LINTFLAGS (**LEGACY**)
If *sysconf*(_SC_XBS5_LP64_OFF64) returns –1, the meaning of this value is unspecified. Otherwise, this value is the set of options to be given to the *lint* utility to check application source using a programming model with 64-bit **int**, **long**, **pointer**, and **off_t** types.

XSI _CS_XBS5_LPBIG_OFFBIG_CFLAGS (**LEGACY**)
If *sysconf*(_SC_XBS5_LPBIG_OFFBIG) returns –1, the meaning of this value is unspecified. Otherwise, this value is the set of initial options to be given to the *cc* and *c99* utilities to build an application using a programming model with an **int** type using at least 32 bits and **long**, **pointer**, and **off_t** types using at least 64 bits.

XSI _CS_XBS5_LPBIG_OFFBIG_LDFLAGS (**LEGACY**)
If *sysconf*(_SC_XBS5_LPBIG_OFFBIG) returns –1, the meaning of this value is unspecified. Otherwise, this value is the set of final options to be given to the *cc* and *c99* utilities to build an application using a programming model with an **int** type using at least 32 bits and **long**, **pointer**, and **off_t** types using at least 64 bits.

XSI _CS_XBS5_LPBIG_OFFBIG_LIBS (**LEGACY**)
If *sysconf*(_SC_XBS5_LPBIG_OFFBIG) returns –1, the meaning of this value is unspecified. Otherwise, this value is the set of libraries to be given to the *cc* and *c99* utilities to build an application using a programming model with an **int** type using at least 32 bits and **long**, **pointer**, and **off_t** types using at least 64 bits.

XSI _CS_XBS5_LPBIG_OFFBIG_LINTFLAGS (**LEGACY**)
If *sysconf*(_SC_XBS5_LPBIG_OFFBIG) returns –1, the meaning of this value is unspecified. Otherwise, this value is the set of options to be given to the *lint* utility to check application source using a programming model with an **int** type using at least 32 bits and **long**, **pointer**, and **off_t** types using at least 64 bits.

The following symbolic constants shall be defined for the *lseek*( ) and *fcntl*( ) functions (they have distinct values):

{SEEK_CUR} Set file offset to current plus *offset*.

{SEEK_END} Set file offset to EOF plus *offset*.

{SEEK_SET} Set file offset to *offset*.

15282 value.

15283 The following symbolic constants shall be defined as possible values for the *function* argument
15284 to the *lockf*( ) function:

15285 F_LOCK Lock a section for exclusive use.

15286 F_TEST Test section for locks by other processes.

15287 F_TLOCK Test and lock a section for exclusive use.

15288 F_ULOCK Unlock locked sections.

15289 The following symbolic constants shall be defined for *pathconf*( ):

15290 ADV _PC_ALLOC_SIZE_MIN
15291 AIO _PC_ASYNC_IO
15292 _PC_CHOWN_RESTRICTED
15293 _PC_FILESIZEBITS
15294 _PC_LINK_MAX
15295 _PC_MAX_CANON
15296 _PC_MAX_INPUT
15297 _PC_NAME_MAX
15298 _PC_NO_TRUNC
15299 _PC_PATH_MAX
15300 _PC_PIPE_BUF
15301 _PC_PRIO_IO
15302 ADV _PC_REC_INCR_XFER_SIZE
15303 _PC_REC_MAX_XFER_SIZE
15304 _PC_REC_MIN_XFER_SIZE
15305 _PC_REC_XFER_ALIGN
15306 _PC_SYNC_IO
15307 _PC_VDISABLE

15308 The following symbolic constants shall be defined for file streams:

15309 STDERR_FILENO File number of *stderr*; 2.

15310 STDIN_FILENO File number of *stdin*; 0.

15311 STDOUT_FILENO File number of *stdout*; 1.

15312 **Type Definitions**

15313 The **size_t**, **ssize_t**, **uid_t**, **gid_t**, **off_t**, and **pid_t** types shall be defined as described in | 15314 **<sys/types.h>**. |

15315 The **useconds_t** type shall be defined as described in **<sys/types.h>**. |

15316 The **intptr_t** type shall be defined as described in **<inttypes.h>**. |

15317 The **socklen_t** type shall be defined as described in **<sys/socket.h>**. |

15318 **Declarations**

15319 The following shall be declared as functions and may also be defined as macros. Function
15320 prototypes shall be provided for use with an ISO C standard compiler.

```
15321      int           access(const char *, int);
15322      unsigned      alarm(unsigned);
15323 XSI  int           brk(void *);
15324      int           chdir(const char *);
15325      int           chown(const char *, uid_t, gid_t);
15326      int           close(int);
15327      size_t        confstr(int, char *, size_t);
15328 XSI  char         *crypt(const char *, const char *);
15329      char         *ctermid(char *);
15330      int           dup(int);
15331      int           dup2(int, int);
15332 XSI  void          encrypt(char[64], int);
15333      int           execl(const char *, const char *, ...);
15334      int           execle(const char *, const char *, ...);
15335      int           execlp(const char *, const char *, ...);
15336      int           execv(const char *, char *const []);
15337      int           execve(const char *, char *const [], char *const []);
15338      int           execvp(const char *, char *const []);
15339      void         _exit(int);
15340 XSI  int           fchown(int, uid_t, gid_t);
15341      int           fchdir(int);
15342 SIO  int           fdatasync(int);
15343      pid_t         fork(void);
15344      long          fpathconf(int, int);
15345      int           fsync(int);
15346      int           ftruncate(int, off_t);
15347      char         *getcwd(char *, size_t);
15348      gid_t         getegid(void);
15349      uid_t         geteuid(void);
15350      gid_t         getgid(void);
15351      int           getgroups(int, gid_t []);
15352 XSI  long          gethostid(void);
15353      int           gethostname(char *, socklen_t);
```

```
15354          char        *getlogin(void);
15355          int          getlogin_r(char *, size_t);
15356          int          getopt(int, char * const [], const char *);
15357 XSI      pid_t        getpgid(pid_t);
15358          pid_t        getpgrp(void);
15359          pid_t        getpid(void);
15360          pid_t        getppid(void);
15361 XSI      pid_t        getsid(pid_t);
15362          uid_t        getuid(void);
15363 XSI      char        *getwd(char *); (LEGACY)
15364          int          isatty(int);
15365 XSI      int          lchown(const char *, uid_t, gid_t);
15366          int          link(const char *, const char *);
15367 XSI      int          lockf(int, int, off_t);
15368          off_t        lseek(int, off_t, int);
15369 XSI      int          nice(int);
15370          long         pathconf(const char *, int);
15371          int          pause(void);
15372          int          pipe(int [2]);
15373 XSI      ssize_t      pread(int, void *, size_t, off_t);
15374          ssize_t      pwrite(int, const void *, size_t, off_t);
15375          ssize_t      read(int, void *, size_t);
15376          ssize_t      readlink(const char *restrict, char *restrict, size_t);
15377          int          rmdir(const char *);
15378 XSI      void        *sbrk(intptr_t);
15379          int          setegid(gid_t);
15380          int          seteuid(uid_t);
15381          int          setgid(gid_t);
15382          int          setpgid(pid_t, pid_t);
15383 XSI      pid_t        setpgrp(void);
15384          int          setregid(gid_t, gid_t);
15385          int          setreuid(uid_t, uid_t);
15386          pid_t        setsid(void);
15387          int          setuid(uid_t);
15388          unsigned     sleep(unsigned);
15389 XSI      void         swab(const void *restrict, void *restrict, ssize_t);
15390          int          symlink(const char *, const char *);
15391          void         sync(void);
15392          long         sysconf(int);
15393          pid_t        tcgetpgrp(int);
15394          int          tcsetpgrp(int, pid_t);
15395 XSI      int          truncate(const char *, off_t);
15396          char        *ttyname(int);
15397          int          ttyname_r(int, char *, size_t);
15398 XSI      useconds_t   ualarm(useconds_t, useconds_t);
15399          int          unlink(const char *);
15400 XSI      int          usleep(useconds_t);
15401          pid_t        vfork(void);
15402          ssize_t      write(int, const void *, size_t);
```

15403 Implementations may also include the *pthread_atfork*( ) prototype as defined in **<pthread.h>** (on
15404 page 322).

15405 The following external variables shall be declared:

```
15406 extern char   *optarg;
15407 extern int    optind, opterr, optopt;
```

15408 **APPLICATION USAGE**

15409 None.

15410 **RATIONALE**

15411 As IEEE Std. 1003.1-200x evolved, certain options became sufficiently standardized that it was
15412 concluded that simply requiring one of the option choices was simpler than retaining the option.
15413 However, for backwards compatibility, the option flags (with required constant values) are
15414 retained.

15415 **Version Test Macros**

15416 The standard developers considered altering the definition of _POSIX_VERSION and removing
15417 _SC_VERSION from the specification of *sysconf*( ) since the utility to an application was deemed
15418 by some to be minimal, and since the implementation of the functionality is potentially
15419 problematic.

15420 Applications are allowed the ability to adapt to various versions of IEEE Std. 1003.1-200x at
15421 compile time by conditionally compiling different code depending on the value of
15422 _POSIX_VERSION. For example, an application which expects the semantics of the
15423 POSIX.1-1988 standard *cuserid*( ) but also wishes to compile and run on a system which
15424 conforms to the POSIX.1-1990 standard might be coded as in the following program fragment:

```
15425 #if _POSIX_VERSION == 198808L
15426 val = cuserid();
15427 #else
15428 {
15429 struct passwd *pwp;
15430 pwp = getpwuid(geteuid());
15431 val = pwp->pw_name;
15432 }
15433 #endif
```

15434 While POSIX does not make any attempt to define application binary interaction with the
15435 underlying operating system, the standard developers recognized that support for existing
15436 application binaries is a concern to manufacturers, application developers, and the users of
15437 implementations conforming to IEEE Std. 1003.1-200x. To that end, an application can query
15438 _SC_VERSION at runtime via *sysconf*( ) to determine whether the current version of the
15439 operating system supports the necessary functionality as in the following program fragment:

```
15440 if(sysconf(_SC_VERSION) != 200xxxL) {
15441 fprintf(stderr, "POSIX.1-1990 system required, terminating\n")
15442 exit(1);
15443 }
```

15444 While the above example does not provide the greatest degree of imaginable utility to the
15445 application developer or user, it is arguably better than a core dump or some other equally
15446 obscure result. (It is also possible for implementations to encode and recognize application
15447 binaries compiled in various POSIX.1-conforming environments, and modify the semantics of
15448 the underlying system to conform to the expectations of the application.) For the reasons
15449 outlined in the preceding paragraphs, the standard developers elected to retain the
15450 _POSIX_VERSION and _SC_VERSION functionality.

15451 **Compile-Time Symbolic Constants for System-Wide Options**

15452 IEEE Std. 1003.1-200x now includes support in certain areas for the newly adopted policy
15453 governing options and stubs.

15454 This policy provides flexibility for implementations in how they support options. It also
15455 specifies how conforming applications can adapt to different implementations that support
15456 different sets of options. It allows the following:

15457 1. If an implementation has no interest in supporting an option, it does not have to provide
15458 anything associated with that option beyond the announcement that it does not support it.

15459 2. An implementation can support a partial or incompatible version of an option (as a non-
15460 standard extension) as long as it does not claim to support the option.

15461 3. An application can determine whether the option is supported. A strictly conforming
15462 application must check this announcement mechanism before first using anything
15463 associated with the option.

15464 There is an important implication of this policy. IEEE Std. 1003.1-200x cannot dictate the
15465 behavior of interfaces associated with an option when the implementation does not claim to
15466 support the option. In particular, it cannot require that a function associated with an
15467 unsupported option will fail if it does not perform as specified. However, this policy does not
15468 prevent a standard from requiring certain functions to always be present, but that they shall
15469 always fail on some implementations. The *setpgid*( ) function in the POSIX.1-1990 standard, for
15470 example, is considered appropriate.

15471 The POSIX standards include various options, and the C language binding support for an option
15472 implies that the implementation must supply data types and function interfaces. An application
15473 must be able to discover whether the implementation supports each option.

15474 Any application must consider the following three cases for each option:

15475 1. Option never supported.

15476 The implementation advertises at compile time that the option will never be supported. In
15477 this case, it is not necessary for the implementation to supply any of the data types or
15478 function interfaces that are provided only as part of the option. The implementation might
15479 provide data types and functions that are similar to those defined by IEEE Std. 1003.1-200x,
15480 but there is no guarantee for any particular behavior.

15481 2. Option always supported.

15482 The implementation advertises at compile time that the option will always be supported.
15483 In this case, all data types and function interfaces shall be available and shall operate as
15484 specified.

15485 3. Option might or might not be supported.

15486 Some implementations might not provide a mechanism to specify support of options at
15487 compile time. In addition, the implementation might be unable or unwilling to specify
15488 support or non-support at compile time. In either case, any application that might use the
15489 option at runtime must be able to compile and execute. The implementation must provide,
15490 at compile time, all data types and function interfaces that are necessary to allow this. In
15491 this situation, there must be a mechanism that allows the application to query, at runtime,
15492 whether the option is supported. If the application attempts to use the option when it is
15493 not supported, the result is unspecified unless explicitly specified otherwise in
15494 IEEE Std. 1003.1-200x.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The symbolic constants F_ULOCK, F_LOCK, F_TLOCK, F_TEST, GF_PATH, IF_PATH, and PF_PATH are withdrawn.

The required value of _XOPEN_VERSION is defined and the constant is marked as an extension.

The constants _XOPEN_XPG2, _XOPEN_XPG3, and _XOPEN_XPG4 are added.

The constants _POSIX2_* are added.

Reference to the **<sys/types.h>** header is added for the definitions of **size_t**, **ssize_t**, **uid_t**, **gid_t**, **off_t**, and **pid_t**. These are marked as extensions.

The names *chroot*( ), *crypt*( ), *encrypt*( ), *fsync*( ), *getopt*( ), *getpass*( ), *nice*( ), and *swab*( ) are added to the list of functions declared in this header. With the exception of *getopt*( ), these are all marked as extensions.

The APPLICATION USAGE section is removed.

The following changes are incorporated for alignment with the ISO POSIX-1 standard and the ISO POSIX-2 standard:

- The function declarations in this header are expanded to full ISO C standard prototypes.
- A large number of new constants are defined for the *sysconf*( ) function, including all those with prefixes _SC_2 and _SC_BC, plus:

  _SC_COLL_WEIGHTS_MAX
  _SC_EXPR_NEST_MAX
  _SC_LINE_MAX
  _SC_RE_DUP_MAX
  _SC_STREAM_MAX
  _SC_TZNAME_MAX

- The *confstr*( ) function is added to the list of functions declared in this header, complete with a new set of constants for alignment with the ISO POSIX-2 standard.

The following change is incorporated for alignment with the FIPS requirements:

- The following symbolic constants are always defined:

15535 _POSIX_CHOWN_RESTRICTED
15536 _POSIX_NO_TRUNC
15537 _POSIX_VDISABLE
15538 _POSIX_SAVED_IDS
15539 _POSIX_JOB_CONTROL

15540 In Issue 3, they are only defined if the associated option is present.

15541 **Issue 4, Version 2**

15542 The following changes are incorporated for X/OPEN UNIX conformance:

15543 • The Option Group constant _XOPEN_UNIX is defined.

15544 • The *sysconf*( ) symbolic constants _SC_ATEXIT_MAX, _SC_IOV_MAX, _SC_PAGESIZE, and
15545 _SC_PAGE_SIZE are defined.

15546 • The *brk*( ), *fchown*( ), *fchdir*( ), *ftruncate*( ), *gethostid*( ), *getpagesize*( ), *getpgid*( ), *getsid*( ), *getwd*( ),
15547 *lchown*( ), *lockf*( ), *readlink*( ), *sbrk*( ), *setpgrp*( ), *setregid*( ), *setreuid*( ), *symlink*( ), *sync*( ),
15548 *truncate*( ), *ualarm*( ), *usleep*( ), and , *vfork*( ) functions are added to the list of functions
15549 declared in this header.

15550 • The symbolic constants F_ULOCK, F_LOCK, F_TLOCK, and F_TEST are added.

15551 **Issue 5**

15552 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
15553 Threads Extension.

15554 The symbolic constants _XOPEN_REALTIME and _XOPEN_REALTIME_THREADS are added.
15555 _POSIX2_C_BIND, _XOPEN_ENH_I18N, and _XOPEN_SHM must now be set to a value other
15556 than –1 by a conforming implementation.

15557 Large File System extensions are added.

15558 The type of the argument to *sbrk*( ) is changed from **int** to **intptr_t**.

15559 _XBS_ constants are added to the list of constants for Options and Option Groups, to the list of
15560 constants for the *confstr*( ) function, and to the list of constants to the *sysconf*( ) function. These
15561 are all marked EX.

15562 **Issue 6**

15563 _POSIX2_C_VERSION is removed.

15564 The Open Group corrigenda item U026/4 has been applied, adding the prototype for *fdatasync*( ).

15565 The Open Group corrigenda item U026/1 has been applied, adding the symbols
15566 _SC_XOPEN_LEGACY, _SC_XOPEN_REALTIME, and _SC_XOPEN_REALTIME_THREADS.

15567 The symbols _XOPEN_STREAMS and _SC_XOPEN_STREAMS are added to support the XSI
15568 STREAMS Option Group.

15569 Constants for profiling options are added.

15570 Text in the DESCRIPTION relating to conformance requirements is moved elsewhere in
15571 IEEE Std. 1003.1-200x.

15572 The legacy symbol _SC_PASS_MAX is removed.

15573 The following new requirements on POSIX implementations derive from alignment with the
15574 Single UNIX Specification:

15575 • The _CS_XBS5_* constants are added for the *confstr*( ) function.

- The _SC_XBS5_* constants are added for the *sysconf*( ) function.
- The symbolic constants F_ULOCK, F_LOCK, F_TLOCK, and F_TEST are added.
- The **uid_t**, **gid_t**, **off_t**, **pid_t**, and **useconds_t** types are mandated.

The *gethostname*( ) prototype is added for sockets.

New section added for System Wide Options.

Function prototypes for *setegid*( ) and *seteuid*( ) are added.

Option symbolic constants are added for _POSIX_ADVISORY_INFO, _POSIX_CPUTIME, _POSIX_SPAWN, _POSIX_SPORADIC_SERVER, _POSIX_THREAD_CPUTIME, _POSIX_THREAD_SPORADIC_SERVER, and _POSIX_TIMEOUTS, and *pathconf*( ) variables are added for _PC_ALLOC_SIZE_MIN, _PC_REC_INCR_XFER_SIZE, _PC_REC_MAX_XFER_SIZE, _PC_REC_MIN_XFER_SIZE, and _PC_REC_XFER_ALIGN for alignment with IEEE Std. 1003.1d-1999.

The following are added for alignment with IEEE Std. 1003.1j-2000:

- Option symbolic constants _POSIX_BARRIERS, _POSIX_CLOCK_SELECTION, _POSIX_MONOTONIC_CLOCK, _POSIX_READER_WRITER_LOCKS, _POSIX_SPIN_LOCKS, and _POSIX_TYPED_MEMORY_OBJECTS
- *sysconf*( ) variables _SC_BARRIERS, _SC_CLOCK_SELECTION, _SC_MONOTONIC_CLOCK, _SC_READER_WRITER_LOCKS, _SC_SPIN_LOCKS, and _SC_TYPED_MEMORY_OBJECTS

The _SC_XBS5 macros associated with the ISO/IEC 9899:1990 standard are marked LEGACY, and new equivalent _SC_V6 macros associated with the ISO/IEC 9899:1999 standard are introduced.

The *getwd*( ) function is marked LEGACY.

The **restrict** keyword is added to the prototypes for *realink*( ) and *swab*( ).

Constants for options are now harmonized, so when supported they take the year of approval of IEEE Std. 1003.1-200x as the value.

The following are added for alignment with IEEE Std. 1003.1q-2000:

- Optional symbolic constants _POSIX_TRACE, _POSIX_TRACE_EVENT_FILTER, _POSIX_TRACE_LOG, and _POSIX_TRACE_INHERIT
- The *sysconf*( ) symbolic constants _SC_TRACE, _SC_TRACE_EVENT_FILTER, _SC_TRACE_LOG, and _SC_TRACE_INHERIT.

15607 **NAME**

15608 utime.h — access and modification times structure

15609 **SYNOPSIS**

15610 `#include <utime.h>`

15611 **DESCRIPTION**

15612 The **<utime.h>** header shall declare the structure **utimbuf**, which shall include the following
15613 members:

15614 `time_t` `actime` Access time.
15615 `time_t` `modtime` Modification time.

15616 The times shall be measured in seconds since the Epoch.

15617 The type **time_t** shall be defined as described in **<sys/types.h>**.

15618 The following shall be declared as a function and may also be defined as a macro. Function
15619 prototypes shall be provided for use with an ISO C standard compiler.

15620 `int utime(const char *, const struct utimbuf *);`

15621 **APPLICATION USAGE**

15622 None.

15623 **RATIONALE**

15624 None.

15625 **FUTURE DIRECTIONS**

15626 None.

15627 **SEE ALSO**

15628 **<sys/types.h>**, the System Interfaces volume of IEEE Std. 1003.1-200x, *utime*( )

15629 **CHANGE HISTORY**

15630 First released in Issue 3.

15631 **Issue 4**

15632 Reference to the **<sys/types.h>** header is added for the definition of **time_t**. This is marked as an
15633 extension.

15634 The following change is incorporated for alignment with the ISO POSIX-1 standard:

15635 - The function declarations in this header are expanded to full ISO C standard prototypes.

15636 **Issue 6**

15637 The following new requirements on POSIX implementations derive from alignment with the
15638 Single UNIX Specification:

15639 - The **time_t** type is defined.

15640 **NAME**

15641 utmpx.h — user accounting database definitions

15642 **SYNOPSIS**

15643 XSI
```
#include <utmpx.h>
```
15644

15645 **DESCRIPTION**

15646 The **<utmpx.h>** header shall define the **utmpx** structure that shall include at least the following
15647 members:

15648 `char`	`ut_user[]`	User login name.
15649 `char`	`ut_id[]`	Unspecified initialization process identifier.
15650 `char`	`ut_line[]`	Device name.
15651 `pid_t`	`ut_pid`	Process ID.
15652 `short`	`ut_type`	Type of entry.
15653 `struct timeval`	`ut_tv`	Time entry was made.

15654 The **pid_t** type shall be defined through **typedef** as described in **<sys/types.h>**.

15655 The **timeval** structure shall be defined as described in **<sys/time.h>**.

15656 Inclusion of the **<utmpx.h>** header may also make visible all symbols from **<sys/time.h>**.

15657 The following symbolic constants shall be defined as possible values for the *ut_type* member of
15658 the **utmpx** structure:

15659 EMPTY	No valid user accounting information.
15660 BOOT_TIME	Identifies time of system boot.
15661 OLD_TIME	Identifies time when system clock changed.
15662 NEW_TIME	Identifies time after system clock changed.
15663 USER_PROCESS	Identifies a process.
15664 INIT_PROCESS	Identifies a process spawned by the init process.
15665 LOGIN_PROCESS	Identifies the session leader of a logged in user.
15666 DEAD_PROCESS	Identifies a session leader who has exited.

15667 The following shall be declared as functions and may also be defined as macros. Function
15668 prototypes shall be provided for use with an ISO C standard compiler.

```
15669 void          endutxent(void);
15670 struct utmpx *getutxent(void);
15671 struct utmpx *getutxid(const struct utmpx *);
15672 struct utmpx *getutxline(const struct utmpx *);
15673 struct utmpx *pututxline(const struct utmpx *);
15674 void          setutxent(void);
```

15675 **APPLICATION USAGE**

15676 None.

15677 **RATIONALE**

15678 None.

15679 **FUTURE DIRECTIONS**

15680 None.

15681 **SEE ALSO**

15682 **<sys/time.h>**, **<sys/types.h>**, the System Interfaces volume of IEEE Std. 1003.1-200x, *endutxent*( )

15683 **CHANGE HISTORY**

15684 First released in Issue 4, Version 2.

15685 **NAME**

15686 wchar.h — wide-character types

15687 **SYNOPSIS**

15688 `#include <wchar.h>`

15689 **DESCRIPTION**

15690 CX The functionality described on this reference page extends the ISO C standard. Applications
15691 shall define the appropriate feature test macro (see the System Interfaces volume of
15692 IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of
15693 symbols in this header.

15694 The **<wchar.h>** header shall define the following data types through **typedef**:

15695 **wchar_t** As described in **<stddef.h>**.

15696 **wint_t** An integer type capable of storing any valid value of **wchar_t** or WEOF.

15697 **wctype_t** A scalar type of a data object that can hold values which represent locale-
15698 specific character classification.

15699 **mbstate_t** An object type other than an array type that can hold the conversion state
15700 information necessary to convert between sequences of (possibly multibyte)
15701 XSI characters and wide characters. If a codeset is being used such that an
15702 **mbstate_t** needs to preserve more than 2 levels of reserved state, the results
15703 are unspecified.

15704 XSI **FILE** As described in **<stdio.h>**.

15705 **size_t** As described in **<stddef.h>**.

15706 The **<wchar.h>** header shall declare the following as functions and may also define them as
15707 macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
15708 wint_t        btowc(int);
15709 wint_t        fgetwc(FILE *);
15710 wchar_t      *fgetws(wchar_t *restrict, int, FILE *restrict);
15711 wint_t        fputwc(wchar_t, FILE *);
15712 int           fputws(const wchar_t *restrict, FILE *restrict);
15713 int           fwide(FILE *, int);
15714 int           fwprintf(FILE *restrict, const wchar_t *restrict, ...);
15715 int           fwscanf(FILE *restrict, const wchar_t *restrict, ...);
15716 wint_t        getwc(FILE *);
15717 wint_t        getwchar(void);
15718 int           iswalnum(wint_t);
15719 int           iswalpha(wint_t);
15720 int           iswcntrl(wint_t);
15721 int           iswctype(wint_t, wctype_t);
15722 int           iswdigit(wint_t);
15723 int           iswgraph(wint_t);
15724 int           iswlower(wint_t);
15725 int           iswprint(wint_t);
15726 int           iswpunct(wint_t);
15727 int           iswspace(wint_t);
15728 int           iswupper(wint_t);
15729 int           iswxdigit(wint_t);
15730 size_t        mbrlen(const char *restrict, size_t, mbstate_t *restrict);
15731 size_t        mbrtowc(wchar_t *restrict, const char *restrict, size_t,
```

```
15732                       mbstate_t *restrict);
15733       int             mbsinit(const mbstate_t *);
15734       size_t          mbsrtowcs(wchar_t *restrict, const char **restrict, size_t,
15735                       mbstate_t *restrict);
15736       wint_t          putwc(wchar_t, FILE *);
15737       wint_t          putwchar(wchar_t);
15738       int             swprintf(wchar_t *restrict, size_t,
15739                       const wchar_t *restrict, ...);
15740       int             swscanf(const wchar_t *restrict,
15741                       const wchar_t *restrict, ...);
15742       wint_t          towlower(wint_t);
15743       wint_t          towupper(wint_t);
15744       wint_t          ungetwc(wint_t, FILE *);
15745       int             vfwprintf(FILE *restrict, const wchar_t *restrict, va_list);
15746       int             vfwscanf(FILE *restrict, const wchar_t *restrict, va_list);
15747       int             vwprintf(const wchar_t *restrict, va_list);
15748       int             vswprintf(wchar_t *restrict, size_t,
15749                       const wchar_t *restrict, va_list);
15750       int             vswscanf(const wchar_t *restrict, const wchar_t *restrict,
15751                       va_list);
15752       int             vwscanf(const wchar_t *restrict, va_list);
15753       size_t          wcrtomb(char *restrict, wchar_t, mbstate_t *restrict);
15754       wchar_t        *wcscat(wchar_t *restrict, const wchar_t *restrict);
15755       wchar_t        *wcschr(const wchar_t *, wchar_t);
15756       int             wcscmp(const wchar_t *, const wchar_t *);
15757       int             wcscoll(const wchar_t *, const wchar_t *);
15758       wchar_t        *wcscpy(wchar_t *restrict, const wchar_t *restrict);
15759       size_t          wcscspn(const wchar_t *, const wchar_t *);
15760       size_t          wcsftime(wchar_t *restrict, size_t,
15761                       const wchar_t *restrict, const struct tm *restrict);
15762       size_t          wcslen(const wchar_t *);
15763       wchar_t        *wcsncat(wchar_t *restrict, const wchar_t *restrict, size_t);
15764       int             wcsncmp(const wchar_t *, const wchar_t *, size_t);
15765       wchar_t        *wcsncpy(wchar_t *restrict, const wchar_t *restrict, size_t);
15766       wchar_t        *wcspbrk(const wchar_t *, const wchar_t *);
15767       wchar_t        *wcsrchr(const wchar_t *, wchar_t);
15768       size_t          wcsrtombs(char *restrict, const wchar_t **restrict,
15769                       size_t, mbstate_t *restrict);
15770       size_t          wcsspn(const wchar_t *, const wchar_t *);
15771       wchar_t        *wcsstr(const wchar_t *restrict, const wchar_t *restrict);
15772       double          wcstod(const wchar_t *restrict, wchar_t **restrict);
15773       float           wcstof(const wchar_t *restrict, wchar_t **restrict);
15774       wchar_t        *wcstok(wchar_t *restrict, const wchar_t *restrict,
15775                       wchar_t **restrict);
15776       long            wcstol(const wchar_t *restrict, wchar_t **restrict, int);
15777       long double     wcstold(const wchar_t *restrict, wchar_t **restrict);
15778       long long       wcstoll(const wchar_t *restrict, wchar_t **restrict, int);
15779       unsigned long   wcstoul(const wchar_t *restrict, wchar_t **restrict, int);
15780       unsigned long long
15781                       wcstoull(const wchar_t *restrict, wchar_t **restrict, int);
15782 XSI   wchar_t        *wcswcs(const wchar_t *, const wchar_t *);
15783       int             wcswidth(const wchar_t *, size_t);
```

```
15784       size_t        wcsxfrm(wchar_t *restrict, const wchar_t *restrict, size_t);
15785       int           wctob(wint_t);
15786       wctype_t      wctype(const char *);
15787 XSI   int           wcwidth(wchar_t);
15788       wchar_t      *wmemchr(const wchar_t *, wchar_t, size_t);
15789       int           wmemcmp(const wchar_t *, const wchar_t *, size_t);
15790       wchar_t      *wmemcpy(wchar_t *restrict, const wchar_t *restrict, size_t);
15791       wchar_t      *wmemmove(wchar_t *, const wchar_t *, size_t);
15792       wchar_t      *wmemset(wchar_t *, wchar_t, size_t);
15793       int           wprintf(const wchar_t *restrict, ...);
15794       int           wscanf(const wchar_t *restrict, ...);
```

15795 The **<wchar.h>** header shall define the following macro names:

15796 WCHAR_MAX The maximum value representable by an object of type **wchar_t**.

15797 WCHAR_MIN The minimum value representable by an object of type **wchar_t**.

15798 WEOF Constant expression of type **wint_t** that is returned by several WP functions
15799 to indicate end-of-file.

15800 NULL As described in **<stddef.h>**.

15801 The tag **tm** shall be declared as naming an incomplete structure type, the contents of which are
15802 described in the header **<time.h>**.

15803 Inclusion of the **<wchar.h>** header may make visible all symbols from the headers **<ctype.h>**,
15804 **<stdio.h>**, **<stdarg.h>**, **<stdlib.h>**, **<string.h>**, **<stddef.h>**, and **<time.h>**.

15823 **CHANGE HISTORY**

15824 First released in Issue 4.

15825 **Issue 5**

15826 Aligned with the ISO / IEC 9899: 1990 / Amendment 1: 1995 (E).

Issue 6

The Open Group corrigenda item U021/10 has been applied. The prototypes for *wcswidth*( ) and *wcwidth*( ) are marked as extensions.

The Open Group corrigenda item U028/5 has been applied, correcting the prototype for the *mbsinit*( ) function.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- Various function prototypes are updated to add the **restrict** keyword.
- The functions *vfwscanf*( ), *vswscanf*( ), *wcstof*( ), *wcstold*( ), *wcstoll*( ), and *wcstoull*( ) are added.

15835 **NAME**

15836 wctype.h — wide-character classification and mapping utilities

15837 **SYNOPSIS**

15838 `#include <wctype.h>`

15839 **DESCRIPTION**

15840 CX The functionality described on this reference page extends the ISO C standard. Applications
15841 shall define the appropriate feature test macro (see the System Interfaces volume of
15842 IEEE Std. 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of
15843 symbols in this header.

15844 The **<wctype.h>** header shall define the following data types through **typedef**:

15845 **wint_t** As described in **<wchar.h>**.

15846 **wctrans_t** A scalar type that can hold values which represent locale-specific character
15847 mappings.

15848 **wctype_t** As described in **<wchar.h>**.

15849 The **<wctype.h>** header shall declare the following as functions and may also define them as
15850 macros. Function prototypes shall be provided for use with an ISO C standard compiler.

```
15851 int       iswalnum(wint_t);
15852 int       iswalpha(wint_t);
15853 int       iswblank(wint_t);
15854 int       iswcntrl(wint_t);
15855 int       iswdigit(wint_t);
15856 int       iswgraph(wint_t);
15857 int       iswlower(wint_t);
15858 int       iswprint(wint_t);
15859 int       iswpunct(wint_t);
15860 int       iswspace(wint_t);
15861 int       iswupper(wint_t);
15862 int       iswxdigit(wint_t);
15863 int       iswctype(wint_t, wctype_t);
15864 wint_t    towctrans(wint_t, wctrans_t);
15865 wint_t    towlower(wint_t);
15866 wint_t    towupper(wint_t);
15867 wctrans_t wctrans(const char *);
15868 wctype_t  wctype(const char *);
```

15869 The **<wctype.h>** header shall define the following macro name:

15870 WEOF Constant expression of type **wint_t** that is returned by several MSE functions
15871 to indicate end-of-file.

15872 For all functions described in this header that accept an argument of type **wint_t**, the value is
15873 representable as a **wchar_t** or equals the value of WEOF. If this argument has any other value,
15874 the behavior is undefined.

15875 The behavior of these functions shall be affected by the *LC_CTYPE* category of the current locale.

15876 Inclusion of the **<wctype.h>** header may make visible all symbols from the headers **<ctype.h>**,
15877 **<stdio.h>**, **<stdarg.h>**, **<stdlib.h>**, **<string.h>**, **<stddef.h>**, **<time.h>**, and **<wchar.h>**.

15878 **APPLICATION USAGE**

15879 None.

15880 **RATIONALE**

15881 None.

15882 **FUTURE DIRECTIONS**

15883 None.

15884 **SEE ALSO**

15890 First released in Issue 5. Derived from the ISO / IEC 9899: 1990 / Amendment 1: 1995 (E). |

15891 **Issue 6** |

15892 The *iswblank*( ) function is added for alignment with the ISO / IEC 9899: 1999 standard. |

15893 **NAME**

15894 wordexp.h — word-expansion types

15895 **SYNOPSIS**

15896 `#include <wordexp.h>`

15897 **DESCRIPTION**

15898 The **<wordexp.h>** header shall define the structures and symbolic constants used by the
15899 *wordexp*( ) and *wordfree*( ) functions.

15900 The structure type **wordexp_t** shall contain at least the following members:

15901 `size_t  we_wordc` Count of words matched by *words*.
15902 `char  **we_wordv` Pointer to list of expanded words.
15903 `size_t  we_offs` Slots to reserve at the beginning of *we_wordv*.

15904 The *flags* argument to the *wordexp*( ) function shall be the bitwise-inclusive OR of the following
15905 flags:

15906 WRDE_APPEND Append words to those previously generated.

15907 WRDE_DOOFFS Number of null pointers to prepend to *we_wordv*.

15908 WRDE_NOCMD Fail if command substitution is requested.

15909 WRDE_REUSE The *pwordexp* argument was passed to a previous successful call to
15910 *wordexp*( ), and has not been passed to *wordfree*( ). The result is the same
15911 as if the application had called *wordfree*( ) and then called *wordexp*( )
15912 without WRDE_REUSE.

15913 WRDE_SHOWERR Do not redirect *stderr* to **/dev/null**.

15914 WRDE_UNDEF Report error on an attempt to expand an undefined shell variable.

15915 The following constants shall be defined as error return values:

15916 WRDE_BADCHAR One of the unquoted characters—<newline>, `'|'`, `'&'`, `';'`, `'<'`, `'>'`,
15917 `'('`, `')'`, `'{'`, `'}'`—appears in *words* in an inappropriate context.

15918 WRDE_BADVAL Reference to undefined shell variable when WRDE_UNDEF is set in *flags*.

15919 WRDE_CMDSUB Command substitution requested when WRDE_NOCMD was set in flags.

15920 WRDE_NOSPACE Attempt to allocate memory failed.

15921 WRDE_NOSYS The implementation does not support the function.

15922 WRDE_SYNTAX Shell syntax error, such as unbalanced parentheses or unterminated
15923 string.

15924 The following shall be declared as functions and may also be declared as macros. Function
15925 prototypes shall be provided for use with an ISO C standard compiler.

```
15926 int  wordexp(const char *restrict, wordexp_t *restrict, int);
15927 void wordfree(wordexp_t *);
```

15928 The implementation may define additional macros or constants using names beginning with
15929 WRDE_.

Index

Chapter 1

Introduction

1.1 Scope

The scope of IEEE Std. 1003.1-200x is described in the Base Definitions volume of IEEE Std. 1003.1-200x.

1.2 Conformance

Conformance requirements for IEEE Std. 1003.1-200x are defined in the Base Definitions volume of IEEE Std. 1003.1-200x, Chapter 2, Conformance.

1.3 Normative References

Normative references for IEEE Std. 1003.1-200x are defined in the Base Definitions volume of IEEE Std. 1003.1-200x.

1.4 Changes from Issue 4

Notes to Reviewers

This section with side shading will not appear in the final copy. - Ed.

The change history is subject to revision. The intent is to document changes from Issue 4 thru Issue 6, with the latest change history also documenting changes from the ISO POSIX-1:1996 standard.

The following sections describe changes made to this volume of IEEE Std. 1003.1-200x since Issue 4. The CHANGE HISTORY section for each entry details the technical changes that have been made to that entry since Issue 4. Changes made between Issue 2 and Issue 4 are not included.

1.4.1 Changes from Issue 4 to Issue 4, Version 2

The following list summarizes the major changes that were made in this volume of IEEE Std. 1003.1-200x from Issue 4 to Issue 4, Version 2:

- The X/Open UNIX extension was added. This specifies the common core APIs of 4.3 Berkeley Software Distribution (BSD 4.3), the OSF AES, and SVID Issue 3.
- STREAMS were added as part of the X/Open UNIX extension.
- Existing Issue 4 functions were clarified as a result of industry feedback.

1.4.2 Changes from Issue 4, Version 2 to Issue 5

The following list summarizes the major changes that were made in this volume of IEEE Std. 1003.1-200x from Issue 4, Version 2 to Issue 5:

- Functions previously defined in the ISO POSIX-2 standard C-language Binding, Shared Memory, Enhanced Internationalization, and X/Open UNIX Extension Feature Groups were moved to the BASE.
- Threads were added to the BASE for alignment with the POSIX Threads Extension.
- The Realtime Threads Feature Group was added.
- The Realtime Feature Group was added for alignment with the POSIX Realtime Extension.
- Multibyte Support Extensions (MSE) were added to the BASE for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E).
- Large File Summit (LFS) Extensions were added to the BASE for support of 64-bit or larger files and file systems.
- X/Open-specific threads extensions were added to the BASE.
- X/Open-specific dynamic linking functions were added to the BASE.
- A new category Legacy was added.
- The categories TO BE WITHDRAWN and WITHDRAWN were removed.

1.4.3 Changes from Issue 5 to Issue 6 (IEEE Std. 1003.1-200x)

The following list summarizes the major changes that were made in this volume of IEEE Std. 1003.1-200x from Issue 5 to Issue 6:

- This volume of IEEE Std. 1003.1-200x is extensively revised so it can be both an IEEE POSIX Standard and an Open Group Technical Standard.
- The POSIX System Interfaces requirements incorporate support of FIPS 151-2.
- The POSIX System Interfaces requirements are updated to align with some features of the Single UNIX Specification.
- A RATIONALE section is added to each reference page.

1.5 New Features

1.5.1 New Features in Issue 4, Version 2

The functions, headers, and external variables first introduced in Issue 4, Version 2 are listed in the table below.

New Functions, Headers, and External Variables in Issue 4, Version 2				
FD_CLR( )	*endutxent*( )	*gettimeofday*( )	*ptsname*( )	*sigaltstack*( )
FD_ISSET( )	*expm1*( )	*getutxent*( )	*putmsg*( )	*sighold*( )
FD_SET( )	*fattach*( )	*getutxid*( )	*putpmsg*( )	*sigignore*( )
FD_ZERO( )	*fchdir*( )	*getutxline*( )	*pututxline*( )	*siginterrupt*( )
_longjmp( )	*fchmod*( )	*getwd*( )	*random*( )	*sigpause*( )
_setjmp( )	*fchown*( )	*grantpt*( )	*re_comp*( )	*sigrelse*( )
a64l( )	*fcvt*( )	*ilogb*( )	*re_exec*( )	*sigset*( )
acosh( )	*fdetach*( )	*index*( )	*readlink*( )	*sigstack*( )
asinh( )	*ffs*( )	*initstate*( )	*readv*( )	*srandom*( )
atanh( )	*fmtmsg*( )	*insque*( )	*realpath*( )	*statvfs*( )
basename( )	*fstatvfs*( )	*ioctl*( )	*regcmp*( )	*strcasecmp*( )
bcmp( )	*ftime*( )	*isastream*( )	*regex*( )	*strdup*( )
bcopy( )	*ftok*( )	*killpg*( )	*remainder*( )	*strncasecmp*( )
brk( )	*ftruncate*( )	*l64a*( )	*remque*( )	*swapcontext*( )
bsd_signal( )	*gcvt*( )	*lchown*( )	*rindex*( )	*symlink*( )
bzero( )	*getcontext*( )	*lockf*( )	*rint*( )	*sync*( )
cbrt( )	*getdate*( )	*log1p*( )	*sbrk*( )	*syslog*( )
closelog( )	*getdtablesize*( )	*logb*( )	*scalb*( )	*tcgetsid*( )
dbm_clearerr( )	*getgrent*( )	*lstat*( )	*select*( )	*truncate*( )
dbm_close( )	*gethostid*( )	*makecontext*( )	*setcontext*( )	*ttyslot*( )
dbm_delete( )	*getitimer*( )	*mknod*( )	*setgrent*( )	*ualarm*( )
dbm_error( )	*getmsg*( )	*mkstemp*( )	*setitimer*( )	*unlockpt*( )
dbm_fetch( )	*getpagesize*( )	*mktemp*( )	*setlogmask*( )	*usleep*( )
dbm_firstkey( )	*getpgid*( )	*mmap*( )	*setpgrp*( )	*utimes*( )
dbm_nextkey( )	*getpmsg*( )	*mprotect*( )	*setpriority*( )	*valloc*( )
dbm_open( )	*getpriority*( )	*msync*( )	*setpwent*( )	*vfork*( )
dbm_store( )	*getpwent*( )	*munmap*( )	*setregid*( )	*wait3*( )
dirname( )	*getrlimit*( )	*nextafter*( )	*setreuid*( )	*waitid*( )
ecvt( )	*getrusage*( )	*nftw*( )	*setrlimit*( )	*writev*( )
endgrent( )	*getsid*( )	*openlog*( )	*setstate*( )	
endpwent( )	*getsubopt*( )	*poll*( )	*setutxent*( )	
<fmtmsg.h>	**<re_comp.h>**	**<sys/resource.h>**	**<sys/uio.h>**	**<utmpx.h>**

1.5.2 New Features in Issue 5

The functions and headers first introduced in Issue 5 are listed in the table below.

New Functions and Headers in Issue 5		
aio_cancel( )	*pthread_attr_getstacksize*( )	*pthread_self*( )
aio_error( )	*pthread_attr_init*( )	*pthread_setcancelstate*( )
aio_fsync( )	*pthread_attr_setdetachstate*( )	*pthread_setcanceltype*( )
aio_read( )	*pthread_attr_setguardsize*( )	*pthread_setconcurrency*( )
aio_return( )	*pthread_attr_setinheritsched*( )	*pthread_setschedparam*( )
aio_suspend( )	*pthread_attr_setschedparam*( )	*pthread_setspecific*( )
aio_write( )	*pthread_attr_setschedpolicy*( )	*pthread_sigmask*( )
asctime_r( )	*pthread_attr_setscope*( )	*pthread_testcancel*( )
btowc( )	*pthread_attr_setstackaddr*( )	*putc_unlocked*( )
clock_getres( )	*pthread_attr_setstacksize*( )	*putchar_unlocked*( )
clock_gettime( )	*pthread_cancel*( )	*pwrite*( )
clock_settime( )	*pthread_cleanup_pop*( )	*rand_r*( )
ctime_r( )	*pthread_cleanup_push*( )	*readdir_r*( )
dlclose( )	*pthread_cond_broadcast*( )	*sched_get_priority_max*( )
dlerror( )	*pthread_cond_destroy*( )	*sched_get_priority_min*( )
dlopen( )	*pthread_cond_init*( )	*sched_getparam*( )
dlsym( )	*pthread_cond_signal*( )	*sched_getscheduler*( )
fdatasync( )	*pthread_cond_timedwait*( )	*sched_rr_get_interval*( )
flockfile( )	*pthread_cond_wait*( )	*sched_setparam*( )
fseeko( )	*pthread_condattr_destroy*( )	*sched_setscheduler*( )
ftello( )	*pthread_condattr_getpshared*( )	*sched_yield*( )
ftrylockfile( )	*pthread_condattr_init*( )	*sem_close*( )
funlockfile( )	*pthread_condattr_setpshared*( )	*sem_destroy*( )
fwide( )	*pthread_create*( )	*sem_getvalue*( )
fwprintf( )	*pthread_detach*( )	*sem_init*( )
fwscanf( )	*pthread_equal*( )	*sem_open*( )
getc_unlocked( )	*pthread_exit*( )	*sem_post*( )
getchar_unlocked( )	*pthread_getconcurrency*( )	*sem_trywait*( )
getgrgid_r( )	*pthread_getschedparam*( )	*sem_unlink*( )
getgrnam_r( )	*pthread_getspecific*( )	*sem_wait*( )
getlogin_r( )	*pthread_join*( )	*shm_open*( )
getpwnam_r( )	*pthread_key_create*( )	*shm_unlink*( )
getpwuid_r( )	*pthread_key_delete*( )	*sigqueue*( )
gmtime_r( )	*pthread_kill*( )	*sigtimedwait*( )
lio_listio( )	*pthread_mutex_destroy*( )	*sigwait*( )
localtime_r( )	*pthread_mutex_getprioceiling*( )	*sigwaitinfo*( )
mbrlen( )	*pthread_mutex_init*( )	*snprintf*( )
mbrtowc( )	*pthread_mutex_lock*( )	*strtok_r*( )
mbsinit( )	*pthread_mutex_setprioceiling*( )	*swprintf*( )
mbsrtowcs( )	*pthread_mutex_trylock*( )	*swscanf*( )
mlock( )	*pthread_mutex_unlock*( )	*timer_create*( )
mlockall( )	*pthread_mutexattr_destroy*( )	*timer_delete*( )
mq_close( )	*pthread_mutexattr_getprioceiling*( )	*timer_getoverrun*( )
mq_getattr( )	*pthread_mutexattr_getprotocol*( )	*timer_gettime*( )
mq_notify( )	*pthread_mutexattr_getpshared*( )	*timer_settime*( )
mq_open( )	*pthread_mutexattr_gettype*( )	*towctrans*( )

New Functions and Headers in Issue 5		
mq_receive( )	*pthread_mutexattr_init*( )	*ttyname_r*( )
mq_send( )	*pthread_mutexattr_setprioceiling*( )	*vfwprintf*( )
mq_setattr( )	*pthread_mutexattr_setprotocol*( )	*vsnprintf*( )
mq_unlink( )	*pthread_mutexattr_setpshared*( )	*vswprintf*( )
munlock( )	*pthread_mutexattr_settype*( )	*vwprintf*( )
munlockall( )	*pthread_once*( )	*wcrtomb*( )
nanosleep( )	*pthread_rwlock_destroy*( )	*wcsrtombs*( )
pread( )	*pthread_rwlock_init*( )	*wcsstr*( )
pthread_atfork( )	*pthread_rwlock_rdlock*( )	*wctob*( )
pthread_attr_destroy( )	*pthread_rwlock_tryrdlock*( )	*wctrans*( )
pthread_attr_getdetachstate( )	*pthread_rwlock_trywrlock*( )	*wmemchr*( )
pthread_attr_getguardsize( )	*pthread_rwlock_unlock*( )	*wmemcmp*( )
pthread_attr_getinheritsched( )	*pthread_rwlock_wrlock*( )	*wmemcpy*( )
pthread_attr_getschedparam( )	*pthread_rwlockattr_destroy*( )	*wmemmove*( )
pthread_attr_getschedpolicy( )	*pthread_rwlockattr_getpshared*( )	*wmemset*( )
pthread_attr_getscope( )	*pthread_rwlockattr_init*( )	*wprintf*( )
pthread_attr_getstackaddr( )	*pthread_rwlockattr_setpshared*( )	*wscanf*( )

1.5.3 New Features in Issue 6

Notes to Reviewers

This section with side shading will not appear in the final copy. - Ed.

A table listing new functions, headers, etc. since the ISO POSIX-1:1996 standard will be added here in a future draft.

1.6 Terminology

This section appears in the Base Definitions volume of IEEE Std. 1003.1-200x, but is repeated here for convenience:

For the purposes of IEEE Std. 1003.1-200x, the following terminology definitions apply:

can
Describes a permissible optional feature or behavior available to the user or application. The feature or behavior is mandatory for an implementation that conforms to IEEE Std. 1003.1-200x. An application can rely on the existence of the feature or behavior.

implementation-defined
Describes a value or behavior that is not defined by IEEE Std. 1003.1-200x but is selected by an implementor. The value or behavior may vary among implementations that conform to IEEE Std. 1003.1-200x. An application should not rely on the existence of the value or behavior. An application that relies on such a value or behavior cannot be assured to be portable across conforming implementations.

The implementor shall document such a value or behavior so that it can be used correctly by an application.

legacy
Describes a feature or behavior that is being retained for compatibility with older applications, but which has limitations which make it inappropriate for developing portable applications. New applications should use alternative means of obtaining equivalent functionality.

may
Describes a feature or behavior that is optional for an implementation that conforms to IEEE Std. 1003.1-200x. An application should not rely on the existence of the feature or behavior. An application that relies on such a feature or behavior cannot be assured to be portable across conforming implementations.

To avoid ambiguity, the opposite of *may* is expressed as *need not*, instead of *may not*.

shall
For an implementation that conforms to IEEE Std. 1003.1-200x, describes a feature or behavior that is mandatory. An application can rely on the existence of the feature or behavior.

For an application or user, describes a behavior that is mandatory.

should
For an implementation that conforms to IEEE Std. 1003.1-200x, describes a feature or behavior that is recommended but not mandatory. An application should not rely on the existence of the feature or behavior. An application that relies on such a feature or behavior cannot be assured to be portable across conforming implementations.

For an application, describes a feature or behavior that is recommended programming practice for optimum portability.

undefined
Describes the nature of a value or behavior not defined by IEEE Std. 1003.1-200x which results from use of an invalid program construct or invalid data input.

The value or behavior may vary among implementations that conform to IEEE Std. 1003.1-200x. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be

assured to be portable across conforming implementations.

unspecified

Describes the nature of a value or behavior not specified by IEEE Std. 1003.1-200x which results from use of a valid program construct or valid data input.

The value or behavior may vary among implementations that conform to IEEE Std. 1003.1-200x. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

1.7 Definitions

Concepts and definitions are defined in the Base Definitions volume of IEEE Std. 1003.1-200x.

1.8 Relationship to Other Formal Standards

Great care has been taken to ensure that this volume of IEEE Std. 1003.1-200x is fully aligned with the following standards:

ISO C (1999)

ISO/IEC 9899:1999, Programming Languages — C.

Parts of the ISO/IEC 9899:1999 standard (hereinafter referred to as the ISO C standard) are referenced to describe requirements also mandated by this volume of IEEE Std. 1003.1-200x. Some functions and headers included within this volume of IEEE Std. 1003.1-200x have a version in the ISO C standard; in this case CX markings are added as appropriate to show where the ISO C standard has been extended. Any conflict between this volume of IEEE Std. 1003.1-200x and the ISO C standard is unintentional.

This volume of IEEE Std. 1003.1-200x also allows, but does not require, mathematics functions to support IEEE Std. 754-1985 and IEEE Std. 854-1987.

1.9 Portability

Some of the utilities in the Shell and Utilities volume of IEEE Std. 1003.1-200x and functions in the System Interfaces volume of IEEE Std. 1003.1-200x describe functionality that might not be fully portable to systems meeting the requirements for POSIX conformance (see the Base Definitions volume of IEEE Std. 1003.1-200x, Chapter 2, Conformance).

Where optional, enhanced, or reduced functionality is specified, the text is shaded and a code in the margin identifies the nature of the option, extension, or warning (see Section 1.9.1). For maximum portability, an application should avoid such functionality.

1.9.1 Codes

Margin codes and their meanings are listed in the Base Definitions volume of IEEE Std. 1003.1-200x, but are repeated here for convenience:

ADV Advisory Information
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the ADV margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the ADV margin legend.

AIO Asynchronous Input and Output
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the AIO margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the AIO margin legend.

BAR Barriers
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the BAR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the BAR margin legend.

BE Batch Environment Services and Utilities
The functionality described is optional.

Where applicable, utilities are marked with the BE margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the BE margin legend.

CD C-Language Development Utilities
The functionality described is optional.

Where applicable, utilities are marked with the CD margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the CD margin legend.

CPT Process CPU-Time Clocks
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the CPT margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the CPT

margin legend.

CS Clock Selection
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the CS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the CS margin legend.

CX Extension to the ISO C standard
The functionality described is an extension to the ISO C standard. Application writers may make use of an extension as it is supported on all IEEE Std. 1003.1-200x-conforming systems.

FD FORTRAN Development Utilities
The functionality described is optional.

Where applicable, utilities are marked with the FD margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the FD margin legend.

FR FORTRAN Runtime Utilities
The functionality described is optional.

Where applicable, utilities are marked with the FR margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the FR margin legend.

FSC File Synchronization
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the FSC margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the FSC margin legend.

IP6 IPV6
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the IP6 margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the IP6 margin legend.

MAN Mandatory in the Next Draft
This is an interim draft code used to aid reviewers during the development of IEEE Std. 1003.1-200x. It denotes a feature that was previously an option or extension that is being brought into the mandatory base functionality. This margin code will be removed from the final draft.

MF Memory Mapped Files
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MF margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MF margin legend.

ML Process Memory Locking
The functionality described is optional. The functionality described is also an extension to the

ISO C standard.

Where applicable, functions are marked with the ML margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the ML margin legend.

MLR Range Memory Locking

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MLR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MLR margin legend.

MON Monotonic Clock

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MON margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MON margin legend.

MPR Memory Protection

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MPR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MPR margin legend.

MSG Message Passing

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MSG margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MSG margin legend.

OB Obsolescent

The functionality described may be withdrawn in a future version of this volume of IEEE Std. 1003.1-200x. Strictly Conforming POSIX Applications and Strictly Conforming XSI Applications shall not use obsolescent features.

OF Output Format Incompletely Specified

The functionality described is an XSI extension. The format of the output produced by the utility is not fully specified. It is therefore not possible to post-process this output in a consistent fashion. Typical problems include unknown length of strings and unspecified field delimiters.

OH Optional Header

In the SYNOPSIS section of some interfaces in the System Interfaces volume of IEEE Std. 1003.1-200x an included header is marked as in the following example:

OH
```
#include <sys/types.h>
#include <grp.h>
struct group *getgrnam(const char *name);
```

This indicates that the marked header is not required on XSI-conformant systems.

PIO Prioritized Input and Output
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the PIO margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the PIO margin legend.

PS Process Scheduling
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the PS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the PS margin legend.

RTS Realtime Signals Extension
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the RTS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the RTS margin legend.

SD Software Development Utilities
The functionality described is optional.

Where applicable, utilities are marked with the SD margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the SD margin legend.

SEM Semaphores
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SEM margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SEM margin legend.

SHM Shared Memory Objects
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SHM margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SHM margin legend.

SIO Synchronized Input and Output
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SIO margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SIO margin legend.

SPI Spin Locks
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SPI margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SPI margin legend.

SPN Spawn

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SPN margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SPN margin legend.

SS Process Sporadic Server

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SS margin legend.

TCT Thread CPU-Time Clocks

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TCT margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TCT margin legend.

THR Threads

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the THR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the THR margin legend.

TMO Timeouts

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TMO margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TMO margin legend.

TMR Timers

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TMR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TMR margin legend.

TPI Threads Priority Inheritance

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TPI margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TPI margin legend.

TPP Thread Priority Protection

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TPP margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TPP margin legend.

TPS Thread Execution Scheduling

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TPS margin legend for the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TPS margin legend.

TRC Trace

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TRC margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TRC margin legend.

TEF Trace Event Filter

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TEF margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TEF margin legend.

TRL Trace Log

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TRL margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TRL margin legend.

TRI Trace Inherit

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TRI margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TRI margin legend.

TSA Thread Stack Address Attribute

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TPS margin legend for the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSA margin legend.

TSF Thread-Safe Functions

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TSF margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSF margin legend.

TSH Thread Process-Shared Synchronization

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TSH margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSH margin legend.

TSP Thread Sporadic Server

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TSP margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSP margin legend.

TSS Thread Stack Address Size

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TSS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSS margin legend.

TYM Typed Memory Objects

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TYM margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TYM margin legend.

UN Possibly Unsupportable Feature

The functionality described is an XSI extension. It need not be possible to implement the required functionality (as defined) on all conformant systems and the functionality need not be present. This may, for example, be the case where the conformant system is hosted and the underlying system provides the service in an alternative way.

UP User Portability Utilities

The functionality described is optional.

Where applicable, utilities are marked with the UP margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the UP margin legend.

XSI Extension

The functionality described is an XSI extension. Functionality marked XSI is also an extension to the ISO C standard. Application writers may confidently make use of an extension on all systems supporting the X/Open System Interfaces Extension.

If an entire SYNOPSIS section is shaded and marked with one XSI, all the functionality described in that reference page is an extension. See the Base Definitions volume of IEEE Std. 1003.1-200x, Section 3.441, XSI.

XSR XSI STREAMS

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the XSR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the XSR margin legend.

1.10 Format of Entries

The entries in Chapter 3 are based on a common format as follows. The only sections relating to conformance are the SYNOPSIS, DESCRIPTION, RETURN VALUE, and ERRORS sections.

NAME

This section gives the name or names of the entry and briefly states its purpose.

SYNOPSIS

This section summarizes the use of the entry being described. If it is necessary to include a header to use this function, the names of such headers are shown, for example:

```
#include <stdio.h>
```

DESCRIPTION

This section describes the functionality of the function or header.

RETURN VALUE

This section indicates the possible return values, if any.

If the implementation can detect errors, ''successful completion'' means that no error has been detected during execution of the function. If the implementation does detect an error, the error is indicated.

For functions where no errors are defined, ''successful completion'' means that if the implementation checks for errors, no error has been detected. If the implementation can detect errors, and an error is detected, the indicated return value is returned and *errno* may be set.

ERRORS

This section gives the symbolic names of the values returned in *errno* if an error occurs.

''No errors are defined'' means that values and usage of *errno*, if any, depend on the implementation.

EXAMPLES

This section is non-normative.

This section gives examples of usage, where appropriate. In the event of conflict between an example and a normative part of this volume of IEEE Std. 1003.1-200x, the normative material is to be taken as correct.

APPLICATION USAGE

This section is non-normative.

This section gives warnings and advice to application writers about the entry. In the event of conflict between warnings and advice and a normative part of this volume of IEEE Std. 1003.1-200x, the normative material is to be taken as correct.

RATIONALE

This section is non-normative.

This section contains historical information concerning the contents of this volume of IEEE Std. 1003.1-200x and why features were included or discarded by the standard developers.

FUTURE DIRECTIONS

This section is non-normative.

599 This section provides comments which should be used as a guide to current thinking;
600 there is not necessarily a commitment to adopt these future directions.

601 **SEE ALSO**

602 This section is non-normative.

603 This section gives references to related information.

604 **CHANGE HISTORY**

605 This section is non-normative.

606 This section shows the derivation of the entry and any significant changes that have
607 been made to it.

Chapter 2

General Information

This chapter covers information that is relevant to all the functions specified in Chapter 3 and the Base Definitions volume of IEEE Std. 1003.1-200x, Chapter 13, Headers.

2.1 Use and Implementation of Functions

Each of the following statements shall apply unless explicitly stated otherwise in the detailed descriptions that follow:

1. If an argument to a function has an invalid value (such as a value outside the domain of the function, or a pointer outside the address space of the program, or a null pointer), the behavior is undefined.

2. Any function declared in a header may also be implemented as a macro defined in the header, so a library function should not be declared explicitly if its header is included. Any macro definition of a function can be suppressed locally by enclosing the name of the function in parentheses, because the name is then not followed by the left parenthesis that indicates expansion of a macro function name. For the same syntactic reason, it is permitted to take the address of a library function even if it is also defined as a macro. The use of the C-language **#undef** construct to remove any such macro definition shall also ensure that an actual function is referred to.

3. Any invocation of a library function that is implemented as a macro shall expand to code that evaluates each of its arguments exactly once, fully protected by parentheses where necessary, so it is generally safe to use arbitrary expressions as arguments. Likewise, those function-like macros described in the following sections may be invoked in an expression anywhere a function with a compatible return type could be called.

4. Provided that a library function can be declared without reference to any type defined in a header, it is also permissible to declare the function, either explicitly or implicitly, and use it without including its associated header.

5. If a function that accepts a variable number of arguments is not declared (explicitly or by including its associated header), the behavior is undefined.

2.2 The Compilation Environment

2.2.1 POSIX.1 Symbols

Certain symbols in this volume of IEEE Std. 1003.1-200x are defined in headers (see the Base Definitions volume of IEEE Std. 1003.1-200x, Chapter 13, Headers). Some of those headers could also define other symbols than those defined by this volume of IEEE Std. 1003.1-200x, potentially conflicting with symbols used by the application. Also, this volume of IEEE Std. 1003.1-200x defines symbols that are not permitted by other standards to appear in those headers without some control on the visibility of those symbols.

Symbols called feature test macros are used to control the visibility of symbols that might be included in a header. Implementations, future versions of this volume of IEEE Std. 1003.1-200x, and other standards may define additional feature test macros.

In the compilation of an application that **#define**s a feature test macro specified by IEEE Std. 1003.1-200x, no header defined by IEEE Std. 1003.1-200x shall be included prior to the definition of the feature test macro. This restriction also applies to any implementation-provided header in which these feature test macros are used. If the definition of the macro does not precede the **#include**, the result is undefined.

Feature test macros shall begin with the underscore character ('_').

2.2.1.1 The _POSIX_C_SOURCE Feature Test Macro

A POSIX-conforming application should ensure that the feature test macro _POSIX_C_SOURCE is defined before inclusion of any header.

When an application includes a header described by this volume of IEEE Std. 1003.1-200x, and when this feature test macro is defined to have at least the value 200xMML:

1. All symbols required by this volume of IEEE Std. 1003.1-200x to appear when the header is included shall be made visible.
2. Symbols that are explicitly permitted, but not required, by this volume of IEEE Std. 1003.1-200x to appear in that header (including those in reserved name spaces) may be made visible.
3. Additional symbols not required or explicitly permitted by this volume of IEEE Std. 1003.1-200x to be in that header shall not be made visible, except when enabled by another feature test macro or by having defined _POSIX_C_SOURCE with a value larger than 200xxxL.

Identifiers in this volume of IEEE Std. 1003.1-200x may only be undefined using the **#undef** directive as described in Section 2.1 (on page 511) or Section 2.2.2 (on page 513). These **#undef** directives shall follow all **#include** directives of any header in this volume of IEEE Std. 1003.1-200x.

2.2.1.2 The _XOPEN_SOURCE Feature Test Macro

XSI An XSI-conforming application should ensure that the feature test macro _XOPEN_SOURCE is defined with the value 600 before inclusion of any header. This is needed to enable the functionality described in Section 2.2.1.1 and in addition to enable the X/Open System Interfaces Extension.

Since this volume of IEEE Std. 1003.1-200x is aligned with the ISO C standard, and since all functionality enabled by _POSIX_C_SOURCE set greater than zero and less than or equal to 200xxxL should be enabled by _XOPEN_SOURCE set equal to 600, there should be no need to

define either _POSIX_SOURCE or _POSIX_C_SOURCE if _XOPEN_SOURCE is so defined. Therefore, if _XOPEN_SOURCE is set equal to 600 and _POSIX_SOURCE is defined, or _POSIX_C_SOURCE is set greater than zero and less than or equal to 200xxxL, the behavior is the same as if only _XOPEN_SOURCE is defined and set equal to 600. However, should _POSIX_C_SOURCE be set to a value greater than 200xxxL, the behavior is undefined.

2.2.2 The Name Space

All identifiers in this volume of IEEE Std. 1003.1-200x, except *environ*, are defined in at least one of the headers, as shown in the Base Definitions volume of IEEE Std. 1003.1-200x, Chapter 13, Headers. When _XOPEN_SOURCE or _POSIX_C_SOURCE is defined, each header defines or declares some identifiers, potentially conflicting with identifiers used by the application. The set of identifiers visible to the application consists of precisely those identifiers from the header pages of the included headers, as well as additional identifiers reserved for the implementation. In addition, some headers may make visible identifiers from other headers as indicated on the relevant header pages.

Implementations may also add members to a structure or union without controlling the visibility of those members with a feature test macro, as long as a user-defined macro with the same name cannot interfere with the correct interpretation of the program. The identifiers reserved for use by the implementation are described below:

1. Each identifier with external linkage described in the header section is reserved for use as an identifier with external linkage if the header is included.
2. Each macro name described in the header section is reserved for any use if the header is included.
3. Each identifier with file scope described in the header section is reserved for use as an identifier with file scope in the same name space if the header is included.

The prefixes posix_, POSIX_, and _POSIX_ are reserved for use by IEEE Std. 1003.1-200x and other POSIX standards. Implementations may add symbols to the headers shown in the following table, provided the identifiers for those symbols begin with the corresponding reserved prefixes in the following table, and do not use the reserved prefixes posix_, POSIX_, or _POSIX_.

	Header	Prefix	Suffix	Complete Name
AIO	**<aio.h>**	aio_, lio_, AIO_, LIO_		
	<arpa/inet.h>	in_, inet_		
	<ctype.h>	to[a-z], is[a-z]		
	<dirent.h>	d_		
	<errno.h>	E[0-9], E[A-Z]		
	<fcntl.h>	l_		
	<glob.h>	gl_		
	<grp.h>	gr_		
	<inttypes.h>	int[0-9a-z_]_t, uint[0-9a-z_]_t		
	<limits.h>		_MAX, _MIN	
	<locale.h>	LC_[A-Z]		
MSG	**<mqueue.h>**	mq_, MQ_		
XSI	**<ndbm.h>**	dbm_		
	<netdb.h>	h_, n_, p_, s_		
	<net/if.h>	if_		
	<netinet/in.h>	in_, ip_, s_, sin_		
XSI	**<poll.h>**	pd_, ph_, ps_		
	<pthread.h>	pthread_, PTHREAD_		
	<pwd.h>	pw_		
	<regex.h>	re_, rm_		
PS	**<sched.h>**	sched_, SCHED_		
SEM	**<semaphore.h>**	sem_, SEM_		
	<signal.h>	sa_, uc_, SIG[A-Z], SIG_[A-Z]		
XSI		ss_, sv_		
RTS		si_, SI_, sigev_, SIGEV_, sival_		
XSI	**<stropts.h>**	bi_, ic_, l_, sl_, str_		
	<stdint.h>	int[0-9a-z_]_t, uint[0-9a-z_]_t		
	<stdlib.h>	str[a-z]		
	<string.h>	str[a-z], mem[a-z], wcs[a-z]		
XSI	**<sys/ipc.h>**	ipc_		key, pad, seq
MF	**<sys/mman.h>**	shm_, MAP_, MCL_, MS_, PROT_		
XSI	**<sys/msg.h>**	msg		msg
XSI	**<sys/resource.h>**	rlim_, ru_		
XSI	**<sys/sem.h>**	sem		sem
XSI	**<sys/shm.h>**	shm		
	<sys/socket.h>	_ss, sa_, if_, ifc_, ifru_, infu_, ifra_, msg_, cmsg_, l_		
	<sys/stat.h>	st_		
XSI	**<sys/statvfs.h>**	f_		
	<sys/time.h>	fds_, it_, tv_, FD_		
	<sys/times.h>	tms_		
XSI	**<sys/uio.h>**	iov_		
	<sys/un.h>	sun_		
	<sys/utsname.h>	uts_		
XSI	**<sys/wait.h>**	si_, W[A-Z], P_		
	<termios.h>	c_		

	Header	Prefix	Suffix	Complete Name
	<time.h>	tm_		
TMR		clock_, timer_, it_, tv_,		
TMR		CLOCK_, TIMER_		
XSI	**<ucontext.h>**	uc_, ss_		
XSI	**<ulimit.h>**	UL_		
	<utime.h>	utim_		
XSI	**<utmpx.h>**	ut_	_LVL, _TIME, _PROCESS	
	<wchar.h>	wcs[a-z]		
	<wctype.h>	is[a-z], to[a-z]		
	<wordexp.h>	we_		
	ANY header	POSIX_, _POSIX_, posix_	_t	

Note: The notation [A–Z] indicates any uppercase letter in the portable character set. The notation [a–z] indicates any lowercase letter in the portable character set. Commas and spaces in the lists of prefixes and complete names in the above table are not part of any prefix or complete name.

If any header in the following table is included, macros with the prefixes shown may be defined. After the last inclusion of a given header, an application may use identifiers with the corresponding prefixes for its own purpose, provided their use is preceded by an **#undef** of the corresponding macro.

Header	Prefix
<dflcn.h>	RTLD_
<fcntl.h>	F_, O_, S_
<fmtmsg.h>	MM_
<fnmatch.h>	FNM_
<ftw.h>	FTW
<glob.h>	GLOB_
<inttypes.h>	PRI[a-z], SCN[a-z]
<ndbm.h>	DBM_
<net/if.h>	IF_
<netinet/in.h>	IMPLINK_, IN_, INADDR_, IP_, IPPORT_, IPPROTO_, SOCK_
<netinet/tcp.h>	TCP_
<nl_types.h>	NL_
<poll.h>	POLL
<regex.h>	REG_
<signal.h>	SA_, SIG_[0-9a-z_],
	BUS_, CLD_, FPE_, ILL_, POLL_, SEGV_, SI_, SS_, SV_, TRAP_
stdint.h	INT[0-9A-Z_]_MIN, INT[0-9A-Z_]_MAX, INT[0-9A-Z_]_C UINT[0-9A-Z_]_MIN, UINT[0-9A-Z_]_MAX, UINT[0-9A-Z_]_C
<stropts.h>	FLUSH[A-Z], I_, M_, MUXID_R[A-Z], S_, SND[A-Z], STR
<syslog.h>	LOG_
<sys/ipc.h>	IPC_
<sys/mman.h>	PROT_, MAP_, MS_
<sys/msg.h>	MSG[A-Z]
<sys/resource.h>	PRIO_, RLIM_, RLIMIT_, RUSAGE_
<sys/sem.h>	SEM_
<sys/shm.h>	SHM[A-Z], SHM_[A-Z]
<sys/socket.h>	AF_, CMSG_, MSG_, PF_, SCM_, SHUT_, SO
<sys/stat.h>	S_
<sys/statvfs.h>	ST_
<sys/time.h>	FD_, ITIMER_
<sys/uio.h>	IOV_
<sys/wait.h>	BUS_, CLD_, FPE_, ILL_, POLL_, SEGV_, SI_, TRAP_
<termios.h>	V, I, O, TC, B[0-9] (See below.)
<wordexp.h>	WRDE_

Note: The notation [0–9] indicates any digit. The notation [A–Z] indicates any uppercase letter in the portable character set. The notation [0–9a–z_] indicates any digit, any lowercase letter in the portable character set, or underscore.

The following reserved names are used as exact matches for **<termios.h>**:

CBAUD	EXTB	VDSUSP
DEFECHO	FLUSHO	VLNEXT
ECHOCTL	LOBLK	VREPRINT
ECHOKE	PENDIN	VSTATUS
ECHOPRT	SWTCH	VWERASE
EXTA	VDISCARD	

The following identifiers are reserved regardless of the inclusion of headers:

1. All identifiers that begin with an underscore and either an uppercase letter or another underscore are always reserved for any use by the implementation.
2. All identifiers that begin with an underscore are always reserved for use as identifiers with file scope in both the ordinary identifier and tag name spaces.
3. All identifiers in the table below are reserved for use as identifiers with external linkage. Some of these identifiers do not appear in this volume of IEEE Std. 1003.1-200x, but are reserved for future use by the ISO C standard.

All the identifiers defined in this volume of IEEE Std. 1003.1-200x that have external linkage are always reserved for use as identifiers with external linkage.

No other identifiers are reserved.

Applications shall not declare or define identifiers with the same name as an identifier reserved in the same context. Since macro names are replaced whenever found, independent of scope and name space, macro names matching any of the reserved identifier names shall not be defined by an application if any associated header is included.

Except that the effect of each inclusion of **<assert.h>** depends on the definition of NDEBUG, headers may be included in any order, and each may be included more than once in a given scope, with no difference in effect from that of being included only once.

If used, the application shall ensure that a header is included outside of any external declaration or definition, and it shall be first included before the first reference to any type or macro it defines, or to any function or object it declares. However, if an identifier is declared or defined in more than one header, the second and subsequent associated headers may be included after the initial reference to the identifier. Prior to the inclusion of a header, the application shall not define any macros with names lexically identical to symbols defined by that header.

2.3 Error Numbers

Most functions can provide an error number. The means by which each function provides its error numbers is specified in its description.

Some functions provide the error number in a variable accessed through the symbol *errno*. The symbol *errno*, defined by including the **<errno.h>** header, is a macro that expands to a modifiable **lvalue** of type **int**.

The value of *errno* should only be examined when it is indicated to be valid by a function's return value. No function in this volume of IEEE Std. 1003.1-200x shall set *errno* to zero. For each thread of a process, the value of *errno* shall not be affected by function calls or assignments to *errno* by other threads.

Some functions return an error number directly as the function value. These functions return a value of zero to indicate success.

If more than one error occurs in processing a function call, any one of the possible errors may be returned, as the order of detection is undefined.

Implementations may support additional errors not included in this list, may generate errors included in this list under circumstances other than those described here, or may contain extensions or limitations that shall prevent some errors from occurring. The ERRORS section on each page specifies whether an error shall be returned, or whether it may be returned. Implementations shall not generate a different error number from the ones described here for error conditions described in this volume of IEEE Std. 1003.1-200x, but may generate additional errors unless explicitly disallowed for a particular function.

Each implementation shall document, in the conformance document, situations in which each of the optional conditions defined in IEEE Std. 1003.1-200x are detected. The conformance document may also contain statements that one or more of the optional error conditions are not detected.

For functions under the Threads option for which [EINTR] is not listed as a possible error condition in this volume of IEEE Std. 1003.1-200x, an implementation shall not return an error code of [EINTR].

The following symbolic names identify the possible error numbers, in the context of the functions specifically defined in this volume of IEEE Std. 1003.1-200x; these general descriptions are more precisely defined in the ERRORS sections of the functions that return them. Only these symbolic names should be used in programs, since the actual value of the error number is unspecified. All values listed in this section shall be unique integer constant expressions with type **int** suitable for use in **#if** preprocessing directives, except as noted below. The values for all these names shall be found in the **<errno.h>** header defined in the Base Definitions volume of IEEE Std. 1003.1-200x. The actual values are unspecified by this volume of IEEE Std. 1003.1-200x.

[E2BIG]

Argument list too long. The sum of the number of bytes used by the new process image's argument list and environment list is greater than the system-imposed limit of {ARG_MAX} bytes.

or:

Lack of space in an output buffer.

or:

Argument is greater than the system-imposed maximum.

[EACCES]
Permission denied. An attempt was made to access a file in a way forbidden by its file access permissions.

[EADDRINUSE]
Address in use. The specified address is in use.

[EADDRNOTAVAIL]
Address not available. The specified address is not available from the local system.

[EAFNOSUPPORT]
Address family not supported. The implementation does not support the specified address family, or the specified address is not a valid address for the address family of the specified socket.

[EAGAIN]
Resource temporarily unavailable. This is a temporary condition and later calls to the same routine may complete normally.

[EALREADY]
Connection already in progress. A connection request is already in progress for the specified socket.

[EBADF]
Bad file descriptor. A file descriptor argument is out of range, refers to no open file, or a read (write) request is made to a file that is only open for writing (reading).

[EBADMSG]
XSR Bad message. During a *read*( ), *getmsg*( ), or *ioctl*( ) I_RECVFD request to a STREAMS device, a message arrived at the head of the STREAM that is inappropriate for the function receiving the message.

read( )	Message waiting to be read on a STREAM is not a data message.
getmsg( )	A file descriptor was received instead of a control message.
ioctl( )	Control or data information was received instead of a file descriptor when I_RECVFD was specified.

or:

Bad Message. The implementation has detected a corrupted message.

[EBUSY]
Resource busy. An attempt was made to make use of a system resource that is not currently available, as it is being used by another process in a manner that would have conflicted with the request being made by this process.

[ECANCELED]
Operation canceled. The associated asynchronous operation was canceled before completion.

[ECHILD]
No child process. A *wait*( ) or *waitpid*( ) function was executed by a process that had no existing or unwaited-for child process.

[ECONNABORTED]
Connection aborted. The connection has been aborted.

[ECONNREFUSED]
Connection refused. An attempt to connect to a socket was refused because there was no

process listening or because the queue of connection requests was full and the underlying protocol does not support retransmissions.

[ECONNRESET]
Connection reset. The connection was forcibly closed by the peer.

[EDEADLK]
Resource deadlock would occur. An attempt was made to lock a system resource that would have resulted in a deadlock situation.

[EDESTADDRREQ]
Destination address required. No bind address was established.

[EDOM]
Domain error. An input argument is outside the defined domain of the mathematical function (defined in the ISO C standard).

[EDQUOT]
Reserved.

[EEXIST]
File exists. An existing file was mentioned in an inappropriate context; for example, as a new link name in the *link*( ) function.

[EFAULT]
Bad address. The system detected an invalid address in attempting to use an argument of a call. The reliable detection of this error cannot be guaranteed, and when not detected may result in the generation of a signal, indicating an address violation, which is sent to the process.

[EFBIG]
File too large. The size of a file would exceed the maximum file size of an implementation or offset maximum established in the corresponding file description.

[EHOSTUNREACH]
Host is unreachable. The destination host cannot be reached (probably because the host is down or a remote router cannot reach it).

[EIDRM]
Identifier removed. Returned during XSI interprocess communication if an identifier has been removed from the system.

[EILSEQ]
Illegal byte sequence. A wide-character code has been detected that does not correspond to a valid character, or a byte sequence does not form a valid wide-character code (defined in the ISO C standard).

[EINPROGRESS]
Operation in progress. This code is used to indicate that an asynchronous operation has not yet completed.

or:

O_NONBLOCK is set for the socket file descriptor and the connection cannot be immediately established.

[EINTR]
Interrupted function call. An asynchronous signal was caught by the process during the execution of an interruptible function. If the signal handler performs a normal return, the interrupted function call may return this condition (see the Base Definitions volume of

IEEE Std. 1003.1-200x, **<signal.h>**).

[EINVAL]
Invalid argument. Some invalid argument was supplied; for example, specifying an undefined signal in a *signal*( ) function or a *kill*( ) function.

[EIO]
Input/output error. Some physical input or output error has occurred. This error may be reported on a subsequent operation on the same file descriptor. Any other error-causing operation on the same file descriptor may cause the [EIO] error indication to be lost.

[EISCONN]
Socket is connected. The specified socket is already connected.

[EISDIR]
Is a directory. An attempt was made to open a directory with write mode specified.

[ELOOP]
Symbolic link loop. A loop exists in symbolic links encountered during path name resolution. This error may also be returned if more than {SYMLOOP_MAX} symbolic links are encountered during path name resolution.

[EMFILE]
Too many open files. An attempt was made to open more than the maximum number of {OPEN_MAX} file descriptors allowed in this process.

[EMLINK]
Too many links. An attempt was made to have the link count of a single file exceed {LINK_MAX}.

[EMSGSIZE]
Message too large. A message sent on a transport provider was larger than an internal message buffer or some other network limit.

or:

Inappropriate message buffer length.

[EMULTIHOP]
Reserved.

[ENAMETOOLONG]
File name too long. The length of a path name exceeds {PATH_MAX}, or a path name component is longer than {NAME_MAX}. This error may also occur when path name substitution, as a result of encountering a symbolic link during path name resolution, results in a path name string the size of which exceeds {PATH_MAX}.

[ENETDOWN]
Network is down. The local network interface used to reach the destination is down.

[ENETRESET]
The connection was aborted by the network.

[ENETUNREACH]
Network unreachable. No route to the network is present.

[ENFILE]
Too many files open in system. Too many files are currently open in the system. The system has reached its predefined limit for simultaneously open files and temporarily cannot accept requests to open another one.

[ENOBUFS]
No buffer space available. Insufficient buffer resources were available in the system to perform the socket operation.

XSR [ENODATA]
No message available. No message is available on the STREAM head read queue.

[ENODEV]
No such device. An attempt was made to apply an inappropriate function to a device; for example, trying to read a write-only device such as a printer.

[ENOENT]
No such file or directory. A component of a specified path name does not exist, or the path name is an empty string.

[ENOEXEC]
Executable file format error. A request is made to execute a file that, although it has the appropriate permissions, is not in the format required by the implementation for executable files.

[ENOLCK]
No locks available. A system-imposed limit on the number of simultaneous file and record locks has been reached and no more are currently available.

[ENOLINK]
Reserved.

[ENOMEM]
Not enough space. The new process image requires more memory than is allowed by the hardware or system-imposed memory management constraints.

[ENOMSG]
No message of the desired type. The message queue does not contain a message of the required type during XSI interprocess communication.

[ENOPROTOOPT]
Protocol not available. The protocol option specified to *setsockopt*( ) is not supported by the implementation.

[ENOSPC]
No space left on a device. During the *write*( ) function on a regular file or when extending a directory, there is no free space left on the device.

XSR [ENOSR]
No STREAM resources. Insufficient STREAMS memory resources are available to perform a STREAMS-related function. This is a temporary condition; it may be recovered from if other processes release resources.

XSR [ENOSTR]
Not a STREAM. A STREAM function was attempted on a file descriptor that was not associated with a STREAMS device.

[ENOSYS]
Function not implemented. An attempt was made to use a function that is not available in this implementation.

[ENOTCONN]
Socket not connected. The socket is not connected.

[ENOTDIR]
Not a directory. A component of the specified path name exists, but it is not a directory, when a directory was expected.

[ENOTEMPTY]
Directory not empty. A directory other than an empty directory was supplied when an empty directory was expected.

[ENOTSOCK]
Not a socket. The file descriptor does not refer to a socket.

[ENOTSUP]
Not supported. The implementation does not support this feature of the Realtime Option Group.

[ENOTTY]
Inappropriate I/O control operation. A control function has been attempted for a file or special file for which the operation is inappropriate.

[ENXIO]
No such device or address. Input or output on a special file refers to a device that does not exist, or makes a request beyond the capabilities of the device. It may also occur when, for example, a tape drive is not on-line.

[EOPNOTSUPP]
Operation not supported on socket. The type of socket (address family or protocol) does not support the requested operation.

[EOVERFLOW]
Value too large to be stored in data type. The user ID or group ID of an IPC or file system object was too large to be stored into the appropriate member of the caller-provided structure. This error shall only occur on implementations that support a larger range of user ID or group ID values than the declared structure member can support. This usually occurs because the IPC or file system object resides on a remote machine with a larger value of the type **uid_t**, **off_t**, or **gid_t** than the local system.

[EPERM]
Operation not permitted. An attempt was made to perform an operation limited to processes with appropriate privileges or to the owner of a file or other resource.

[EPIPE]
Broken pipe. A write was attempted on a socket, pipe, or FIFO for which there is no process to read the data.

[EPROTO]
Protocol error. Some protocol error occurred. This error is device-specific, but is generally not related to a hardware failure.

[EPROTONOSUPPORT]
Protocol not supported. The protocol is not supported by the address family, or the protocol is not supported by the implementation.

[EPROTOTYPE]
Socket type not supported. The socket type is not supported by the protocol.

[ERANGE]
Result too large or too small. The result of the function is too large (overflow) or too small (underflow) to be represented in the available space (defined in the ISO C standard).

[EROFS]
Read-only file system. An attempt was made to modify a file or directory on a file system that is read-only.

[ESPIPE]
Invalid seek. An attempt was made to access the file offset associated with a pipe or FIFO.

[ESRCH]
No such process. No process can be found corresponding to that specified by the given process ID.

[ESTALE]
Reserved.

XSR [ETIME]
STREAM *ioctl*( ) timeout. The timer set for a STREAMS *ioctl*( ) call has expired. The cause of this error is device-specific and could indicate either a hardware or software failure, or a timeout value that is too short for the specific operation. The status of the *ioctl*( ) operation is indeterminate.

[ETIMEDOUT]
Connection timed out. The connection to a remote machine has timed out. If the connection timed out during execution of the function that reported this error (as opposed to timing out prior to the function being called), it is unspecified whether the function has completed some or all of the documented behavior associated with a successful completion of the function.

or:

Operation timed out. The time limit associated with the operation was exceeded before the operation completed.

[ETXTBSY]
Text file busy. An attempt was made to execute a pure-procedure program that is currently open for writing, or an attempt has been made to open for writing a pure-procedure program that is being executed.

[EWOULDBLOCK]
Operation would block. An operation on a socket marked as non-blocking has encountered a situation such as no data available that otherwise would have caused the function to suspend execution.

A conforming implementation may assign the same values for [EWOULDBLOCK] and [EAGAIN].

[EXDEV]
Improper link. A link to a file on another file system was attempted.

2.3.1 Additional Error Numbers

Additional implementation-defined error numbers may be defined in **<errno.h>**.

2.4 Signal Concepts

2.4.1 Signal Generation and Delivery

A signal is said to be *generated* for (or sent to) a process or thread when the event that causes the signal first occurs. Examples of such events include detection of hardware faults, timer expiration, RTS signals generated via the **sigevent** structure and terminal activity, as well as RTS invocations of *kill*( ) and *sigqueue*( ) functions. In some circumstances, the same event generates signals for multiple processes.

At the time of generation, a determination is made whether the signal has been generated for the process or for a specific thread within the process. Signals which are generated by some action attributable to a particular thread, such as a hardware fault, are generated for the thread that caused the signal to be generated. Signals that are generated in association with a process ID or process group ID or an asynchronous event such as terminal activity are generated for the process.

Each process has an action to be taken in response to each signal defined by the system (see Section 2.4.3 (on page 530)). A signal is said to be *delivered* to a process when the appropriate action for the process and signal is taken. A signal is said to be *accepted* by a process when the signal is selected and returned by one of the *sigwait*( ) functions.

During the time between the generation of a signal and its delivery or acceptance, the signal is said to be *pending*. Ordinarily, this interval cannot be detected by an application. However, a signal can be *blocked* from delivery to a thread. If the action associated with a blocked signal is anything other than to ignore the signal, and if that signal is generated for the thread, the signal shall remain pending until it is unblocked, it is accepted when it is selected and returned by a call to the *sigwait*( ) function, or the action associated with it is set to ignore the signal. Signals generated for the process shall be delivered to exactly one of those threads within the process which is in a call to a *sigwait*( ) function selecting that signal or has not blocked delivery of the signal. If there are no threads in a call to a *sigwait*( ) function selecting that signal, and if all threads within the process block delivery of the signal, the signal shall remain pending on the process until a thread calls a *sigwait*( ) function selecting that signal, a thread unblocks delivery of the signal, or the action associated with the signal is set to ignore the signal. If the action associated with a blocked signal is to ignore the signal and if that signal is generated for the process, it is unspecified whether the signal is discarded immediately upon generation or remains pending.

Each thread has a *signal mask* that defines the set of signals currently blocked from delivery to it. The signal mask for a thread is initialized from that of its parent or creating thread, or from the corresponding thread in the parent process if the thread was created as the result of a call to *fork*( ). The *sigaction*( ), *sigprocmask*( ), and *sigsuspend*( ) functions control the manipulation of the signal mask.

The determination of which action is taken in response to a signal is made at the time the signal is delivered, allowing for any changes since the time of generation. This determination is independent of the means by which the signal was originally generated. If a subsequent occurrence of a pending signal is generated, it is implementation-defined as to whether the RTS signal is delivered or accepted more than once in circumstances other than those in which queuing is required under the Realtime Signals Extension option. The order in which multiple, simultaneously pending signals outside the range SIGRTMIN to SIGRTMAX are delivered to or accepted by a process is unspecified.

When any stop signal (SIGSTOP, SIGTSTP, SIGTTIN, SIGTTOU) is generated for a process, any pending SIGCONT signals for that process shall be discarded. Conversely, when SIGCONT is generated for a process, all pending stop signals for that process shall be discarded. When

SIGCONT is generated for a process that is stopped, the process shall be continued, even if the SIGCONT signal is blocked or ignored. If SIGCONT is blocked and not ignored, it shall remain pending until it is either unblocked or a stop signal is generated for the process.

An implementation shall document any condition not specified by this volume of IEEE Std. 1003.1-200x under which the implementation generates signals.

2.4.2 Realtime Signal Generation and Delivery

RTS This section describes extensions to support realtime signal generation and delivery. This functionality is dependent on support of the Realtime Signals Extension option (and the rest of this section is not further shaded for this option).

Some signal-generating functions, such as high-resolution timer expiration, asynchronous I/O completion, interprocess message arrival, and the *sigqueue*( ) function, support the specification of an application-defined value, either explicitly as a parameter to the function or in a **sigevent** structure parameter. The **sigevent** structure is defined in **<signal.h>** and shall contain at least the following members:

Member Type	Member Name	Description
int	*sigev_notify*	Notification type.
int	*sigev_signo*	Signal number.
union sigval	*sigev_value*	Signal value.
void(*)(unsigned sigval)	*sigev_notify_function*	Notification function.
(pthread_attr_t*)	*sigev_notify_attributes*	Notification attributes.

The *sigev_notify* member specifies the notification mechanism to use when an asynchronous event occurs. This volume of IEEE Std. 1003.1-200x defines the following values for the *sigev_notify* member:

SIGEV_NONE No asynchronous notification shall be delivered when the event of interest occurs.

SIGEV_SIGNAL The signal specified in *sigev_signo* shall be generated for the process when the event of interest occurs. If the implementation supports the Realtime Signals Extension option and if the SA_SIGINFO flag is set for that signal number, then the signal shall be queued to the process and the value specified in *sigev_value* shall be the *si_value* component of the generated signal. If SA_SIGINFO is not set for that signal number, it is unspecified whether the signal is queued and what value, if any, is sent.

SIGEV_THREAD A notification function shall be called to perform notification.

An implementation may define additional notification mechanisms.

The *sigev_signo* member specifies the signal to be generated. The *sigev_value* member is the application-defined value to be passed to the signal-catching function at the time of the signal delivery or to be returned at signal acceptance as the *si_value* member of the **siginfo_t** structure.

The **sigval** union is defined in **<signal.h>** and contains at least the following members:

Member Type	Member Name	Description
int	*sival_int*	Integer signal value.
void*	*sival_ptr*	Pointer signal value.

The *sival_int* member is used when the application-defined value is of type **int**; the *sival_ptr* member is used when the application-defined value is a pointer.

When a signal is generated by the *sigqueue*( ) function or any signal-generating function that supports the specification of an application-defined value, the signal shall be marked pending and, if the SA_SIGINFO flag is set for that signal, the signal shall be queued to the process along with the application-specified signal value. Multiple occurrences of signals so generated are queued in FIFO order. It is unspecified whether signals so generated are queued when the SA_SIGINFO flag is not set for that signal.

Signals generated by the *kill*( ) function or other events that cause signals to occur, such as detection of hardware faults, *alarm*( ) timer expiration, or terminal activity, and for which the implementation does not support queuing, have no effect on signals already queued for the same signal number.

When multiple unblocked signals, all in the range SIGRTMIN to SIGRTMAX, are pending, the behavior shall be as if the implementation delivers the pending unblocked signal with the lowest signal number within that range. No other ordering of signal delivery is specified.

If, when a pending signal is delivered, there are additional signals queued to that signal number, the signal remains pending. Otherwise, the pending indication is reset.

Multi-threaded programs can use an alternate event notification mechanism. When a notification is processed, and the *sigev_notify* member of the **sigevent** structure has the value SIGEV_THREAD, the function *sigev_notify_function* is called with parameter *sigev_value*.

The function shall be executed in an environment as if it were the *start_routine* for a newly created thread with thread attributes specified by *sigev_notify_attributes*. If *sigev_notify_attributes* is NULL, the behavior shall be as if the thread were created with the *detachstate* attribute set to PTHREAD_CREATE_DETACHED. Supplying an attributes structure with a *detachstate* attribute of PTHREAD_CREATE_JOINABLE results in undefined behavior. The signal mask of this thread is implementation-defined.

2.4.3 Signal Actions

There are three types of action that can be associated with a signal: SIG_DFL, SIG_IGN, or a pointer to a function. Initially, all signals shall be set to SIG_DFL or SIG_IGN prior to entry of the *main*( ) routine (see the *exec* functions). The actions prescribed by these values are as follows:

SIG_DFL Signal-specific default action.

The default actions for the signals defined in this volume of IEEE Std. 1003.1-200x

RTS are specified under **<signal.h>**. If the Realtime Signals Extension option is supported, the default actions for the realtime signals in the range SIGRTMIN to SIGRTMAX are to terminate the process abnormally.

If the default action is to stop the process, the execution of that process is temporarily suspended. When a process stops, a SIGCHLD signal shall be generated for its parent process, unless the parent process has set the SA_NOCLDSTOP flag. While a process is stopped, any additional signals that are sent to the process shall not be delivered until the process is continued, except SIGKILL which always terminates the receiving process. A process that is a member of an orphaned process group shall not be allowed to stop in response to

1401 the SIGTSTP, SIGTTIN, or SIGTTOU signals. In cases where delivery of one of
1402 these signals would stop such a process, the signal shall be discarded.

1403 Setting a signal action to SIG_DFL for a signal that is pending, and whose default
1404 action is to ignore the signal (for example, SIGCHLD), shall cause the pending
1405 signal to be discarded, whether or not it is blocked.

1406 The default action for SIGCONT is to resume execution at the point where the
1407 RTS process was stopped, after first handling any pending unblocked signals. If the
1408 Realtime Signals Extension option is supported, any queued values pending shall
1409 be discarded and the resources used to queue them shall be released and returned
1410 to the system for other use.

1411 SIG_IGN Ignore signal.

1412 Delivery of the signal shall have no effect on the process. The behavior of a process
1413 RTS is undefined after it ignores a SIGFPE, SIGILL, SIGSEGV, or SIGBUS signal that
1414 RTS was not generated by *kill*( ), *sigqueue*( ), or *raise*( ).

1415 The system shall not allow the action for the signals SIGKILL or SIGSTOP to be set
1416 to SIG_IGN.

1417 Setting a signal action to SIG_IGN for a signal that is pending shall cause the
1418 pending signal to be discarded, whether or not it is blocked.

1419 If a process sets the action for the SIGCHLD signal to SIG_IGN, the behavior is
1420 XSI unspecified, except as specified below.

1421 If the action for the SIGCHLD signal is set to SIG_IGN, child processes of the
1422 calling processes shall not be transformed into zombie processes when they
1423 terminate. If the calling process subsequently waits for its children, and the process
1424 has no unwaited-for children that were transformed into zombie processes, it shall
1425 block until all of its children terminate, and *wait*( ), *waitid*( ), and *waitpid*( ) shall fail
1426 and set *errno* to [ECHILD].

1427 RTS If the Realtime Signals Extension option is supported, any queued values pending
1428 shall be discarded and the resources used to queue them shall be released and
1429 made available to queue other signals.

1430 *pointer to a function*
1431 Catch signal.

1432 On delivery of the signal, the receiving process is to execute the signal-catching
1433 function at the specified address. After returning from the signal-catching function,
1434 the receiving process shall resume execution at the point at which it was
1435 interrupted.

1436 If the SA_SIGINFO flag for the signal is cleared, the signal-catching function shall
1437 be entered as a C-language function call as follows:

1438 `void` *`func`*`(int` *`signo`*`);`

1439 XSI | RTS If the SA_SIGINFO flag for the signal is set, the signal-catching function shall be
1440 entered as a C-language function call as follows:

1441 `void` *`func`*`(int` *`signo`*`, siginfo_t *`*`info`*`, void *`*`context`*`);`

1442 where *func* is the specified signal-catching function, *signo* is the signal number of
1443 the signal being delivered, and *info* is a pointer to a **siginfo_t** structure defined in
1444 **<signal.h>** containing at least the following members:

Member Type	Member Name	Description
int	*si_signo*	Signal number
int	*si_code*	Cause of the signal
union sigval	*si_value*	Signal value

The *si_signo* member contains the signal number. This is the same as the *signo* parameter. The *si_code* member contains a code identifying the cause of the signal. The following values are defined for *si_code*:

Notes to Reviewers

This section with side shading will not appear in the final copy. - Ed.

The shading in this area needs some work.

XSI | RTS SI_USER The signal was sent by the *kill*( ) function. The implementation may set *si_code* to SI_USER if the signal was sent by the *raise*( ) or *abort*( ) functions or any similar functions provided as implementation extensions.

RTS SI_QUEUE The signal was sent by the *sigqueue*( ) function.

RTS SI_TIMER The signal was generated by the expiration of a timer set by *timer_settime*( ).

RTS SI_ASYNCIO The signal was generated by the completion of an asynchronous I/O request.

RTS SI_MESGQ The signal was generated by the arrival of a message on an empty message queue.

If the signal was not generated by one of the functions or events listed above, the *si_code* shall be set to an implementation-defined value that is not equal to any of the values defined above.

RTS If the Realtime Signals Extension is supported, and *si_code* is one of SI_QUEUE, SI_TIMER, SI_ASYNCIO, or SI_MESGQ, then *si_value* contains the application-specified signal value. Otherwise, the contents of *si_value* are undefined.

The behavior of a process is undefined after it returns normally from a signal-
XSI catching function for a SIGBUS, SIGFPE, SIGILL, or SIGSEGV signal that was not
RTS generated by *kill*( ), *sigqueue*( ), or *raise*( ).

The system shall not allow a process to catch the signals SIGKILL and SIGSTOP.

If a process establishes a signal-catching function for the SIGCHLD signal while it has a terminated child process for which it has not waited, it is unspecified whether a SIGCHLD signal is generated to indicate that child process.

When signal-catching functions are invoked asynchronously with process execution, the behavior of some of the functions defined by this volume of IEEE Std. 1003.1-200x is unspecified if they are called from a signal-catching function.

The following table defines a set of functions that are either reentrant or not interruptible by signals and are async-signal-safe. Therefore applications may invoke them, without restriction, from signal-catching functions:

Notes to Reviewers

This section with side shading will not appear in the final copy. - Ed.

The contents of the following tables need to be reviewed.

Base functions:

_Exit( )	*fpathconf*( )	*pipe*( )	*stat*( )
_exit( )	*fstat*( )	*raise*( )	*symlink*( )
access( )	*fsync*( )	*read*( )	*sysconf*( )
alarm( )	*ftruncate*( )	*readlink*( )	*tcdrain*( )
cfgetispeed( )	*getegid*( )	*rename*( )	*tcflow*( )
cfgetospeed( )	*geteuid*( )	*rmdir*( )	*tcflush*( )
cfsetispeed( )	*getgid*( )	*setgid*( )	*tcgetattr*( )
cfsetospeed( )	*getgroups*( )	*setpgid*( )	*tcgetpgrp*( )
chdir( )	*getpgrp*( )	*setsid*( )	*tcsendbreak*( )
chmod( )	*getpid*( )	*setuid*( )	*tcsetattr*( )
chown( )	*getppid*( )	*sigaction*( )	*tcsetpgrp*( )
close( )	*getuid*( )	*sigaddset*( )	*time*( )
creat( )	*kill*( )	*sigdelset*( )	*times*( )
dup( )	*link*( )	*sigemptyset*( )	*umask*( )
dup2( )	*lseek*( )	*sigfillset*( )	*uname*( )
execle( )	*lstat*( )	*sigismember*( )	*unlink*( )
execve( )	*mkdir*( )	*signal*( )	*utime*( )
fchmod( )	*mkfifo*( )	*sigpending*( )	*wait*( )
fchown( )	*open*( )	*sigprocmask*( )	*waitpid*( )
fcntl( )	*pathconf*( )	*sigsuspend*( )	*write*( )
fork( )	*pause*( )	*sleep*( )	

Realtime functions:

aio_error( )	*clock_gettime*( )	*sigpause*( )	*timer_getoverrun*( )
aio_return( )	*fdatasync*( )	*sigqueue*( )	*timer_gettime*( )
aio_suspend( )	*sem_post*( )	*sigset*( )	*timer_settime*( )

Tracing functions:

posix_trace_event( )

All functions not in the above table are considered to be unsafe with respect to signals. In the presence of signals, all functions defined by this volume of IEEE Std. 1003.1-200x shall behave as defined when called from or interrupted by a signal-catching function, with a single exception: when a signal interrupts an unsafe function and the signal-catching function calls an unsafe function, the behavior is undefined.

When a signal is delivered to a thread, if the action of that signal specifies termination, stop, or continue, the entire process shall be terminated, stopped, or continued, respectively.

2.4.4 Signal Effects on Other Functions

Signals affect the behavior of certain functions defined by this volume of IEEE Std. 1003.1-200x if delivered to a process while it is executing such a function. If the action of the signal is to terminate the process, the process shall be terminated and the function shall not return. If the action of the signal is to stop the process, the process shall stop until continued or terminated. Generation of a SIGCONT signal for the process shall cause the process to be continued, and the original function shall continue at the point the process was stopped. If the action of the signal is to invoke a signal-catching function, the signal-catching function shall be invoked; in this case the original function is said to be *interrupted* by the signal.

Notes to Reviewers

This section with side shading will not appear in the final copy. - Ed.

D3, XSH, ERN 20 points out a discrepancy between the following sentence and the paragraph above beginning "All functions not in the above ...". An interpretation will be filed.

If the signal-catching function executes a **return** statement, the behavior of the interrupted function shall be as described individually for that function. Signals that are ignored shall not affect the behavior of any function; signals that are blocked shall not affect the behavior of any function until they are unblocked and then delivered, except as specified for the *sigpending*( ) and *sigwait*( ) functions.

2.5 Standard I/O Streams

A stream is associated with an external file (which may be a physical device) by *opening* a file, which may involve *creating* a new file. Creating an existing file causes its former contents to be discarded if necessary. If a file can support positioning requests, (such as a disk file, as opposed to a terminal), then a *file position indicator* associated with the stream is positioned at the start (byte number 0) of the file, unless the file is opened with append mode, in which case it is implementation-defined whether the file position indicator is initially positioned at the beginning or end of the file. The file position indicator is maintained by subsequent reads, writes, and positioning requests, to facilitate an orderly progression through the file. All input takes place as if bytes were read by successive calls to *fgetc*( ); all output takes place as if bytes were written by successive calls to *fputc*( ).

When a stream is *unbuffered*, bytes are intended to appear from the source or at the destination as soon as possible; otherwise, bytes may be accumulated and transmitted as a block. When a stream is *fully buffered*, bytes are intended to be transmitted as a block when a buffer is filled. When a stream is *line buffered*, bytes are intended to be transmitted as a block when a newline byte is encountered. Furthermore, bytes are intended to be transmitted as a block when a buffer is filled, when input is requested on an unbuffered stream, or when input is requested on a line-buffered stream that requires the transmission of bytes. Support for these characteristics is implementation-defined, and may be affected via *setbuf*( ) and *setvbuf*( ).

A file may be disassociated from a controlling stream by *closing* the file. Output streams are flushed (any unwritten buffer contents are transmitted) before the stream is disassociated from the file. The value of a pointer to a FILE object is indeterminate after the associated file is closed (including the standard streams).

A file may be subsequently reopened, by the same or another program execution, and its contents reclaimed or modified (if it can be repositioned at its start). If the *main*( ) function returns to its original caller, or if the *exit*( ) function is called, all open files are closed (hence all output streams are flushed) before program termination. Other paths to program termination, such as calling *abort*( ), need not close all files properly.

The address of the FILE object used to control a stream may be significant; a copy of a FILE object need not necessarily serve in place of the original.

At program start-up, three streams are predefined and need not be opened explicitly: *standard input* (for reading conventional input), *standard output* (for writing conventional output), and *standard error* (for writing diagnostic output). When opened, the standard error stream is not fully buffered; the standard input and standard output streams are fully buffered if and only if the stream can be determined not to refer to an interactive device.

2.5.1 Interaction of File Descriptors and Standard I/O Streams

CX This section describes the interaction of file descriptors and standard I/O streams. This functionality is an extension to the ISO C standard (and the rest of this section is not further CX shaded).

An open file description may be accessed through a file descriptor, which is created using functions such as *open*( ) or *pipe*( ), or through a stream, which is created using functions such as *fopen*( ) or *popen*( ). Either a file descriptor or a stream is called a *handle* on the open file description to which it refers; an open file description may have several handles.

Handles can be created or destroyed by explicit user action, without affecting the underlying open file description. Some of the ways to create them include *fcntl*( ), *dup*( ), *fdopen*( ), *fileno*( ), and *fork*( ). They can be destroyed by at least *fclose*( ), *close*( ), and the *exec* functions.

A file descriptor that is never used in an operation that could affect the file offset (for example, *read*( ), *write*( ), or *lseek*( )) is not considered a handle for this discussion, but could give rise to one (for example, as a consequence of *fdopen*( ), *dup*( ), or *fork*( )). This exception does not include the file descriptor underlying a stream, whether created with *fopen*( ) or *fdopen*( ), so long as it is not used directly by the application to affect the file offset. The *read*( ) and *write*( ) functions implicitly affect the file offset; *lseek*( ) explicitly affects it.

The result of function calls involving any one handle (the *active handle*) is defined elsewhere in this volume of IEEE Std. 1003.1-200x, but if two or more handles are used, and any one of them is a stream, the application shall ensure that their actions are coordinated as described below. If this is not done, the result is undefined.

A handle which is a stream is considered to be closed when either an *fclose*( ) or *freopen*( ) is executed on it (the result of *freopen*( ) is a new stream, which cannot be a handle on the same open file description as its previous value), or when the process owning that stream terminates with *exit*( ) or *abort*( ). A file descriptor is closed by *close*( ), *_exit*( ), or the *exec* functions when FD_CLOEXEC is set on that file descriptor.

For a handle to become the active handle, the application shall ensure that the actions below are performed between the last use of the handle (the current active handle) and the first use of the second handle (the future active handle). The second handle then becomes the active handle. All activity by the application affecting the file offset on the first handle shall be suspended until it again becomes the active file handle. (If a stream function has as an underlying function one that affects the file offset, the stream function shall be considered to affect the file offset.)

The handles need not be in the same process for these rules to apply.

Note that after a *fork*( ), two handles exist where one existed before. The application shall ensure that, if both handles can ever be accessed, they are both in a state where the other could become the active handle first. The application shall prepare for a *fork*( ) exactly as if it were a change of active handle. (If the only action performed by one of the processes is one of the *exec* functions or *_exit*( ) (not *exit*( )), the handle is never accessed in that process.)

For the first handle, the first applicable condition below applies. After the actions required below are taken, if the handle is still open, the application can close it.

- If it is a file descriptor, no action is required.
- If the only further action to be performed on any handle to this open file descriptor is to close it, no action need be taken.
- If it is a stream which is unbuffered, no action need be taken.
- If it is a stream which is line buffered, and the last byte written to the stream was a newline (that is, as if a:

  ```
  putc('\n')
  ```

  was the most recent operation on that stream), no action need be taken.
- If it is a stream which is open for writing or appending (but not also open for reading), the application shall either perform an *fflush*( ), or the stream shall be closed.
- If the stream is open for reading and it is at the end of the file (*feof*( ) is true), no action need be taken.
- If the stream is open with a mode that allows reading and the underlying open file description refers to a device that is capable of seeking, the application shall either perform an *fflush*( ), or the stream shall be closed.

Otherwise, the result is undefined.

For the second handle:

- If any previous active handle has been used by a function that explicitly changed the file offset, except as required above for the first handle, the application shall perform an *lseek*( ) or *fseek*( ) (as appropriate to the type of handle) to an appropriate location.

If the active handle ceases to be accessible before the requirements on the first handle, above, have been met, the state of the open file description becomes undefined. This might occur during functions such as a *fork*( ) or *_exit*( ).

The *exec* functions make inaccessible all streams that are open at the time they are called, independent of which streams or file descriptors may be available to the new process image.

When these rules are followed, regardless of the sequence of handles used, implementations shall ensure that an application, even one consisting of several processes, shall yield correct results: no data shall be lost or duplicated when writing, and all data shall be written in order, except as requested by seeks. It is implementation-defined whether, and under what conditions, all input is seen exactly once.

If the rules above are not followed, the result is unspecified.

Each function that operates on a stream is said to have zero or more *underlying functions*. This means that the stream function shares certain traits with the underlying functions, but does not require that there be any relation between the implementations of the stream function and its underlying functions.

2.5.2 Stream Orientation and Encoding Rules

For conformance to the ISO/IEC 9899:1999 standard, the definition of a stream includes an *orientation*. After a stream is associated with an external file, but before any operations are performed on it, the stream is without orientation. Once a wide-character input/output function has been applied to a stream without orientation, the stream shall become *wide-oriented*. Similarly, once a byte input/output function has been applied to a stream without orientation, the stream shall become *byte-oriented*. Only a call to the *freopen*( ) function or the *fwide*( ) function can otherwise alter the orientation of a stream.

A successful call to *freopen*( ) shall remove any orientation. The three predefined streams *standard input*, *standard output*, and *standard error* shall be unoriented at program start-up.

Byte input/output functions cannot be applied to a wide-oriented stream, and wide-character input/output functions cannot be applied to a byte-oriented stream. The remaining stream operations shall not affect and shall not be affected by a stream's orientation, except for the following additional restrictions:

- Binary wide-oriented streams have the file positioning restrictions ascribed to both text and binary streams.
- For wide-oriented streams, after a successful call to a file-positioning function that leaves the file position indicator prior to the end-of-file, a wide-character output function can overwrite a partial character; any file contents beyond the byte(s) written are henceforth undefined.

Each wide-oriented stream has an associated **mbstate_t** object that stores the current parse state of the stream. A successful call to *fgetpos*( ) shall store a representation of the value of this **mbstate_t** object as part of the value of the **fpos_t** object. A later successful call to *fsetpos*( ) using the same stored **fpos_t** value shall restore the value of the associated **mbstate_t** object as well as the position within the controlled stream.

Implementations that support multiple encoding rules associate an encoding rule with the stream. The encoding rule shall be determined by the setting of the *LC_CTYPE* category in the current locale at the time when the stream becomes wide-oriented. If a wide-character input/output function is applied to a byte-oriented stream, the encoding rule used is undefined. As with the stream's orientation, the encoding rule associated with a stream cannot be changed once it has been set, except by a successful call to *freopen*( ) which clears the encoding rule and resets the orientation to unoriented.

Although both text and binary wide-oriented streams are conceptually sequences of wide characters, the external file associated with a wide-oriented stream is a sequence of (possibly multibyte) characters generalized as follows:

- Multibyte encodings within files may contain embedded null bytes (unlike multibyte encodings valid for use internal to the program).
- A file need not begin nor end in the initial shift state.

Moreover, the encodings used for characters may differ among files. Both the nature and choice of such encodings are implementation-defined.

The wide-character input functions read characters from the stream and convert them to wide characters as if they were read by successive calls to the *fgetwc*( ) function. Each conversion shall occur as if by a call to the *mbrtowc*( ) function, with the conversion state described by the stream's own **mbstate_t** object, except the encoding rule associated with the stream is used instead of the encoding rule implied by the *LC_CTYPE* category of the current locale.

The wide-character output functions convert wide characters to (possibly multibyte) characters and write them to the stream as if they were written by successive calls to the *fputwc*( ) function. Each conversion shall occur as if by a call to the *wcrtomb*( ) function, with the conversion state described by the stream's own **mbstate_t** object, except the encoding rule associated with the stream is used instead of the encoding rule implied by the *LC_CTYPE* category of the current locale.

An *encoding error* shall occur if the character sequence presented to the underlying *mbrtowc*( ) function does not form a valid (generalized) character, or if the code value passed to the underlying *wcrtomb*( ) function does not correspond to a valid (generalized) character. The wide-character input/output functions and the byte input/output functions store the value of the macro EILSEQ in *errno* if and only if an encoding error occurs.

2.6 STREAMS

XSR STREAMS functionality is provided on implementations supporting the XSI STREAMS Option Group. This functionality is dependent on support of the XSI STREAMS option (and the rest of this section is not further shaded for this option).

STREAMS provides a uniform mechanism for implementing networking services and other character-based I/O. The STREAMS function provides direct access to protocol modules. A STREAM is typically a full-duplex connection between a process and an open device or pseudo-device. However, since pipes may be STREAMS-based, a STREAM can be a full-duplex connection between two processes. The STREAM itself exists entirely within the implementation and provides a general character I/O function for processes. It optionally includes one or more intermediate processing modules that are interposed between the process end of the STREAM (STREAM head) and a device driver at the end of the STREAM (STREAM end).

STREAMS I/O is based on messages. Messages flow in both directions in a STREAM. A given module need not understand and process every message in the STREAM, but every module in the STREAM handles every message. Each module accepts messages from one of its neighbor modules in the STREAM, and passes them to the other neighbor. For example, a line discipline module may transform the data. Data flow through the intermediate modules is bidirectional, with all modules handling, and optionally processing, all messages. There are three types of messages:

- *Data messages* containing actual data for input or output
- *Control data* containing instructions for the STREAMS modules and underlying implementation
- Other messages, which include file descriptors

The function between the STREAM and the rest of the implementation is provided by a set of functions at the STREAM head. When a process calls *write*(), *putmsg*(), *putpmsg*(), or *ioctl*(), messages are sent down the STREAM, and *read*(), *getmsg*(), or *getpmsg*() accepts data from the STREAM and passes it to a process. Data intended for the device at the downstream end of the STREAM is packaged into messages and sent downstream, while data and signals from the device are composed into messages by the device driver and sent upstream to the STREAM head.

When a STREAMS-based device is opened, a STREAM is created that contains two modules: the STREAM head module and the STREAM end (driver) module. If pipes are STREAMS-based in an implementation, when a pipe is created, two STREAMS are created, each containing a STREAM head module. Other modules are added to the STREAM using *ioctl*(). New modules are ''pushed'' onto the STREAM one at a time in last-in, first-out (LIFO) style, as though the STREAM was a push-down stack.

Priority

Message types are classified according to their queuing priority and may be *normal* (non-priority), *priority*, or *high-priority* messages. A message belongs to a particular priority band that determines its ordering when placed on a queue. Normal messages have a priority band of 0 and are always placed at the end of the queue following all other messages in the queue. High-priority messages are always placed at the head of a queue, but are discarded if there is already a high-priority message in the queue. Their priority band is ignored; they are high-priority by virtue of their type. Priority messages have a priority band greater than 0. Priority messages are always placed after any messages of the same or higher priority. High-priority and priority messages are used to send control and data information outside the normal flow of control. By convention, high-priority messages are not affected by flow control. Normal and priority

messages have separate flow controls.

Message Parts

A process may access STREAMS messages that contain a data part, control part, or both. The data part is that information which is transmitted over the communication medium and the control information is used by the local STREAMS modules. The other types of messages are used between modules and are not accessible to processes. Messages containing only a data part are accessible via *putmsg*( ), *putpmsg*( ), *getmsg*( ), *getpmsg*( ), *read*( ), or *write*( ). Messages containing a control part with or without a data part are accessible via calls to *putmsg*( ), *putpmsg*( ), *getmsg*( ), or *getpmsg*( ).

2.6.1 Accessing STREAMS

A process accesses STREAMS-based files using the standard functions *close*( ), *ioctl*( ), *getmsg*( ), *getpmsg*( ), *open*( ), *pipe*( ), *poll*( ), *putmsg*( ), *putpmsg*( ), *read*( ), or *write*( ). Refer to the applicable function definitions for general properties and errors.

Calls to *ioctl*( ) are used to perform control functions with the STREAMS-based device associated with the file descriptor *fildes*. The arguments *command* and *arg* are passed to the STREAMS file designated by *fildes* and are interpreted by the STREAM head. Certain combinations of these arguments may be passed to a module or driver in the STREAM.

Since these STREAMS requests are a subset of *ioctl*( ), they are subject to the errors described there.

STREAMS modules and drivers can detect errors, sending an error message to the STREAM head, thus causing subsequent functions to fail and set *errno* to the value specified in the message. In addition, STREAMS modules and drivers can elect to fail a particular *ioctl*( ) request alone by sending a negative acknowledgement message to the STREAM head. This causes just the pending *ioctl*( ) request to fail and set *errno* to the value specified in the message.

2.7 XSI Interprocess Communication

XSI This section describes extensions to support interprocess communication. This functionality is dependent on support of the XSI Extension (and the rest of this section is not further shaded for this option).

The following message passing, semaphore, and shared memory services form an XSI interprocess communication facility. Certain aspects of their operation are common, and are described below.

IPC Functions		
msgctl( )	*semctl*( )	*shmctl*( )
msgget( )	*semget*( )	*shmdt*( )
msgrcv( )	*semop*( )	*shmget*( )
msgsnd( )	*shmat*( )	

Another interprocess communication facility is provided by functions in the Realtime Option Group; see Section 2.8 (on page 543).

2.7.1 IPC General Description

Each individual shared memory segment, message queue, and semaphore set is identified by a unique positive integer, called respectively a shared memory identifier, *shmid*, a semaphore identifier, *semid*, and a message queue identifier, *msqid*. The identifiers are returned by calls to *shmget*( ), *semget*( ), and *msgget*( ), respectively.

Associated with each identifier is a data structure which contains data related to the operations which may be or may have been performed; see the Base Definitions volume of IEEE Std. 1003.1-200x, **<sys/shm.h>**, **<sys/sem.h>**, and **<sys/msg.h>** for their descriptions.

Each of the data structures contains both ownership information and an **ipc_perm** structure (see the Base Definitions volume of IEEE Std. 1003.1-200x, **<sys/ipc.h>**) which are used in conjunction to determine whether or not read/write (read/alter for semaphores) permissions should be granted to processes using the IPC facilities. The *mode* member of the **ipc_perm** structure acts as a bit field which determines the permissions.

The values of the bits are given below in octal notation.

Bit	Meaning
0400	Read by user.
0200	Write by user.
0040	Read by group.
0020	Write by group.
0004	Read by others.
0002	Write by others.

The name of the **ipc_perm** structure is *shm_perm*, *sem_perm*, or *msg_perm*, depending on which service is being used. In each case, read and write/alter permissions are granted to a process if one or more of the following are true ("xxx" is replaced by *shm*, *sem*, or *msg*, as appropriate):

- The process has appropriate privileges.
- The effective user ID of the process matches *xxx_perm.cuid* or *xxx_perm.uid* in the data structure associated with the IPC identifier, and the appropriate bit of the *user* field in *xxx_perm.mode* is set.

- The effective user ID of the process does not match *xxx_perm.cuid* or *xxx_perm.uid* but the effective group ID of the process matches *xxx_perm.cgid* or *xxx_perm.gid* in the data structure associated with the IPC identifier, and the appropriate bit of the *group* field in *xxx_perm.mode* is set.
- The effective user ID of the process does not match *xxx_perm.cuid* or *xxx_perm.uid* and the effective group ID of the process does not match *xxx_perm.cgid* or *xxx_perm.gid* in the data structure associated with the IPC identifier, but the appropriate bit of the *other* field in *xxx_perm.mode* is set.

Otherwise, the permission is denied.

2.8 Realtime

This section defines functions to support the source portability of applications with realtime requirements. The presence of many of these functions is dependent on support for implementation options described in the text.

The specific functional areas included in this section and their scope include the following. Full definitions of these terms can be found in the Base Definitions volume of IEEE Std. 1003.1-200x, Chapter 3, Definitions.

- Semaphores
- Process Memory Locking
- Memory Mapped Files and Shared Memory Objects
- Priority Scheduling
- Realtime Signal Extension
- Timers
- Interprocess Communication
- Synchronized Input and Output
- Asynchronous Input and Output

All the realtime functions defined in this volume of IEEE Std. 1003.1-200x are portable, although some of the numeric parameters used by an implementation may have hardware dependencies.

2.8.1 Realtime Signals

RTS Realtime signal generation and delivery is dependent on support for the Realtime Signals Extension option.

See Section 2.4.2 (on page 529).

2.8.2 Asynchronous I/O

AIO The functionality described in this section is dependent on support of the Asynchronous Input and Output option (and the rest of this section is not further shaded for this option).

An asynchronous I/O control block structure **aiocb** is used in many asynchronous I/O functions. It is defined in the Base Definitions volume of IEEE Std. 1003.1-200x, **<aio.h>** and has at least the following members:

Member Type	Member Name	Description
int	*aio_fildes*	File descriptor.
off_t	*aio_offset*	File offset.
volatile void*	*aio_buf*	Location of buffer.
size_t	*aio_nbytes*	Length of transfer.
int	*aio_reqprio*	Request priority offset.
struct sigevent	*aio_sigevent*	Signal number and value.
int	*aio_lio_opcode*	Operation to be performed.

The *aio_fildes* element is the file descriptor on which the asynchronous operation is performed.

If O_APPEND is not set for the file descriptor *aio_fildes* and if *aio_fildes* is associated with a device that is capable of seeking, then the requested operation takes place at the absolute position in the file as given by *aio_offset*, as if *lseek*( ) were called immediately prior to the

operation with an *offset* argument equal to *aio_offset* and a *whence* argument equal to SEEK_SET. If O_APPEND is set for the file descriptor, or if *aio_fildes* is associated with a device that is incapable of seeking, write operations append to the file in the same order as the calls were made, with the following exception: under implementation-defined circumstances, such as operation on a multiprocessor or when requests of differing priorities are submitted at the same time, the ordering restriction may be relaxed. After a successful call to enqueue an asynchronous I/O operation, the value of the file offset for the file is unspecified. The *aio_nbytes* and *aio_buf* elements are the same as the *nbyte* and *buf* arguments defined by *read*( ) and *write*( ), respectively.

If _POSIX_PRIORITIZED_IO and _POSIX_PRIORITY_SCHEDULING are defined, then asynchronous I/O is queued in priority order, with the priority of each asynchronous operation based on the current scheduling priority of the calling process. The *aio_reqprio* member can be used to lower (but not raise) the asynchronous I/O operation priority and is within the range zero through {AIO_PRIO_DELTA_MAX}, inclusive. Unless both _POSIX_PRIORITIZED_IO and _POSIX_PRIORITY_SCHEDULING are defined, the order of processing asynchronous I/O requests is unspecified. When both _POSIX_PRIORITIZED_IO and _POSIX_PRIORITY_SCHEDULING are defined, the order of processing of requests submitted by processes whose schedulers are not SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC is unspecified. The priority of an asynchronous request is computed as (process scheduling priority) minus *aio_reqprio*. The priority assigned to each asynchronous I/O request is an indication of the desired order of execution of the request relative to other asynchronous I/O requests for this file. If _POSIX_PRIORITIZED_IO is defined, requests issued with the same priority to a character special file are processed by the underlying device in FIFO order; the order of processing of requests of the same priority issued to files that are not character special files is unspecified. Numerically higher priority values indicate requests of higher priority. The value of *aio_reqprio* has no effect on process scheduling priority. When prioritized asynchronous I/O requests to the same file are blocked waiting for a resource required for that I/O operation, the higher-priority I/O requests shall be granted the resource before lower-priority I/O requests are granted the resource. The relative priority of asynchronous I/O and synchronous I/O is implementation-defined. If _POSIX_PRIORITIZED_IO is defined, the implementation shall define for which files I/O prioritization is supported.

The *aio_sigevent* determines how the calling process shall be notified upon I/O completion, as specified in Section 2.4.1 (on page 528). If *aio_sigevent.sigev_notify* is SIGEV_NONE, then no signal shall be posted upon I/O completion, but the error status for the operation and the return status for the operation shall be set appropriately.

The *aio_lio_opcode* field is used only by the *lio_listio*( ) call. The *lio_listio*( ) call allows multiple asynchronous I/O operations to be submitted at a single time. The function takes as an argument an array of pointers to **aiocb** structures. Each **aiocb** structure indicates the operation to be performed (read or write) via the *aio_lio_opcode* field.

The address of the **aiocb** structure is used as a handle for retrieving the error status and return status of the asynchronous operation while it is in progress.

The **aiocb** structure and the data buffers associated with the asynchronous I/O operation are being used by the system for asynchronous I/O while, and only while, the error status of the asynchronous operation is equal to EINPROGRESS. Applications shall not modify the **aiocb** structure while the structure is being used by the system for asynchronous I/O.

The return status of the asynchronous operation is the number of bytes transferred by the I/O operation. If the error status is set to indicate an error completion, then the return status is set to the return value that the corresponding *read*( ), *write*( ), or *fsync*( ) call would have returned. When the error status is not equal to EINPROGRESS, the return status shall reflect the return status of the corresponding synchronous operation.

2.8.3 Memory Management

2.8.3.1 Memory Locking

ML The functionality described in this section is dependent on support of the Process Memory Locking option (and the rest of this section is not further shaded for this option).

Range memory locking operations are defined in terms of pages. Implementations may restrict the size and alignment of range lockings to be on page-size boundaries. The page size, in bytes, is the value of the configurable system variable {PAGESIZE}. If an implementation has no restrictions on size or alignment, it may specify a 1-byte page size.

Memory locking guarantees the residence of portions of the address space. It is implementation-defined whether locking memory guarantees fixed translation between virtual addresses (as seen by the process) and physical addresses. Per-process memory locks are not inherited across a *fork*( ), and all memory locks owned by a process are unlocked upon *exec* or process termination. Unmapping of an address range removes any memory locks established on that address range by this process.

2.8.3.2 Memory Mapped Files

MF The functionality described in this section is dependent on support of the Memory Mapped Files option (and the rest of this section is not further shaded for this option).

Range memory mapping operations are defined in terms of pages. Implementations may restrict the size and alignment of range mappings to be on page-size boundaries. The page size, in bytes, is the value of the configurable system variable {PAGESIZE}. If an implementation has no restrictions on size or alignment, it may specify a 1-byte page size.

Memory mapped files provide a mechanism that allows a process to access files by directly incorporating file data into its address space. Once a file is mapped into a process address space, the data can be manipulated as memory. If more than one process maps a file, its contents are shared among them. If the mappings allow shared write access, then data written into the memory object through the address space of one process appears in the address spaces of all processes that similarly map the same portion of the memory object.

SHM Shared memory objects are named regions of storage that may be independent of the file system and can be mapped into the address space of one or more processes to allow them to share the associated memory.

SHM An *unlink*( ) of a file or *shm_unlink*( ) of a shared memory object, while causing the removal of the name, does not unmap any mappings established for the object. Once the name has been removed, the contents of the memory object are preserved as long as it is referenced. The memory object remains referenced as long as a process has the memory object open or has some area of the memory object mapped.

2.8.3.3 Memory Protection

MPR MF The functionality described in this section is dependent on support of the Memory Protection and Memory Mapped Files option (and the rest of this section is not further shaded for these options).

When an object is mapped, various application accesses to the mapped region may result in signals. In this context, SIGBUS is used to indicate an error using the mapped object, and SIGSEGV is used to indicate a protection violation or misuse of an address:

- A mapping may be restricted to disallow some types of access.

- Write attempts to memory that was mapped without write access, or any access to memory mapped PROT_NONE, shall result in a SIGSEGV signal.
- References to unmapped addresses shall result in a SIGSEGV signal.
- Reference to whole pages within the mapping, but beyond the current length of the object, shall result in a SIGBUS signal.
- The size of the object is unaffected by access beyond the end of the object (even if a SIGBUS is not generated).

2.8.3.4 *Typed Memory Objects*

TYM The functionality described in this section is dependent on support of the Typed Memory Objects option (and the rest of this section is not further shaded for this option).

Implementations may support the Typed Memory Objects option without supporting the Memory Mapped Files option or the Shared Memory Objects option. Typed memory objects are implementation-configurable named storage pools accessible from one or more processors in a system, each via one or more ports, such as backplane buses, LANs, I/O channels, and so on. Each valid combination of a storage pool and a port is identified through a name that is defined at system configuration time, in an implementation-defined manner; the name may be independent of the file system. Using this name, a typed memory object can be opened and mapped into process address space. For a given storage pool and port, it is necessary to support both dynamic allocation from the pool as well as mapping at an application-supplied offset within the pool; when dynamic allocation has been performed, subsequent deallocation must be supported. Lastly, accessing typed memory objects from different ports requires a method for obtaining the offset and length of contiguous storage of a region of typed memory (dynamically allocated or not); this allows typed memory to be shared among processes and/or processors while being accessed from the desired port.

2.8.4 Process Scheduling

Scheduling Policies

PS The functionality described in this section is dependent on support of the Process Scheduling option (and the rest of this section is not further shaded for this option).

The scheduling semantics described in this volume of IEEE Std. 1003.1-200x are defined in terms of a conceptual model that contains a set of thread lists. No implementation structures are necessarily implied by the use of this conceptual model. It is assumed that no time elapses during operations described using this model, and therefore no simultaneous operations are possible. This model discusses only processor scheduling for runnable threads, but it should be noted that greatly enhanced predictability of realtime applications result if the sequencing of other resources takes processor scheduling policy into account.

There is, conceptually, one thread list for each priority. Any runnable thread may be on any thread list. Multiple scheduling policies shall be provided. Each non-empty thread list is ordered, contains a head as one end of its order, and a tail as the other. The purpose of a scheduling policy is to define the allowable operations on this set of lists (for example, moving threads between and within lists).

Each process shall be controlled by an associated scheduling policy and priority. These parameters may be specified by explicit application execution of the *sched_setscheduler*( ) or *sched_setparam*( ) functions.

Each thread shall be controlled by an associated scheduling policy and priority. These parameters may be specified by explicit application execution of the *pthread_setschedparam*( ) function.

Associated with each policy is a priority range. Each policy definition shall specify the minimum priority range for that policy. The priority ranges for each policy may but need not overlap the priority ranges of other policies.

A conforming implementation shall select the thread that is defined as being at the head of the highest priority non-empty thread list to become a running thread, regardless of its associated policy. This thread is then removed from its thread list.

Four scheduling policies are specifically required. Other implementation-defined scheduling policies may be defined. The following symbols are defined in the Base Definitions volume of IEEE Std. 1003.1-200x, **<sched.h>**:

SCHED_FIFO First in, first out (FIFO) scheduling policy.

SCHED_RR Round robin scheduling policy.

SS SCHED_SPORADIC Sporadic server scheduling policy.

SCHED_OTHER Another scheduling policy.

The values of these symbols shall be distinct.

SCHED_FIFO

Conforming implementations shall include a scheduling policy called the FIFO scheduling policy.

Threads scheduled under this policy are chosen from a thread list that is ordered by the time its threads have been on the list without being executed; generally, the head of the list is the thread that has been on the list the longest time, and the tail is the thread that has been on the list the shortest time.

Under the SCHED_FIFO policy, the modification of the definitional thread lists is as follows:

1. When a running thread becomes a preempted thread, it becomes the head of the thread list for its priority.
2. When a blocked thread becomes a runnable thread, it becomes the tail of the thread list for its priority.
3. When a running thread calls the *sched_setscheduler*( ) function, the process specified in the function call is modified to the specified policy and the priority specified by the *param* argument.
4. When a running thread calls the *sched_setparam*( ) function, the priority of the process specified in the function call is modified to the priority specified by the *param* argument.
5. When a running thread calls the *pthread_setschedparam*( ) function, the thread specified in the function call is modified to the specified policy and the priority specified by the *param* argument.
6. If a thread whose policy or priority has been modified is a running thread or is runnable, it then becomes the tail of the thread list for its new priority.
7. When a running thread issues the *sched_yield*( ) function, the thread becomes the tail of the thread list for its priority.

8. At no other time is the position of a thread with this scheduling policy within the thread lists affected.

For this policy, valid priorities shall be within the range returned by the *sched_get_priority_max*( ) and *sched_get_priority_min*( ) functions when SCHED_FIFO is provided as the parameter. Conforming implementations shall provide a priority range of at least 32 priorities for this policy.

SCHED_RR

Conforming implementations shall include a scheduling policy called the *round robin* scheduling policy. This policy is identical to the SCHED_FIFO policy with the additional condition that when the implementation detects that a running thread has been executing as a running thread for a time period of the length returned by the *sched_rr_get_interval*( ) function or longer, the thread shall become the tail of its thread list and the head of that thread list shall be removed and made a running thread.

The effect of this policy is to ensure that if there are multiple SCHED_RR threads at the same priority, one of them does not monopolize the processor. An application should not rely only on the use of SCHED_RR to ensure application progress among multiple threads if the application includes threads using the SCHED_FIFO policy at the same or higher priority levels or SCHED_RR threads at a higher priority level.

A thread under this policy that is preempted and subsequently resumes execution as a running thread completes the unexpired portion of its round robin interval time period.

For this policy, valid priorities shall be within the range returned by the *sched_get_priority_max*( ) and *sched_get_priority_min*( ) functions when SCHED_RR is provided as the parameter. Conforming implementations shall provide a priority range of at least 32 priorities for this policy.

SCHED_SPORADIC

SS | TSP The functionality described in this section is dependent on support of the Process Sporadic Server or Thread Sporadic Server options (and the rest of this section is not further shaded for these options).

If _POSIX_SPORADIC_SERVER or _POSIX_THREAD_SPORADIC_SERVER is defined, the implementation shall include a scheduling policy identified by the value SCHED_SPORADIC.

The sporadic server policy is based primarily on two parameters: the *replenishment period* and the *available execution capacity*. The replenishment period is given by the *sched_ss_repl_period* member of the **sched_param** structure. The available execution capacity is initialized to the value given by the *sched_ss_init_budget* member of the same parameter. The sporadic server policy is identical to the SCHED_FIFO policy with some additional conditions that cause the thread's assigned priority to be switched between the values specified by the *sched_priority* and *sched_ss_low_priority* members of the **sched_param** structure.

The priority assigned to a thread using the sporadic server scheduling policy is determined in the following manner: if the available execution capacity is greater than zero and the number of pending replenishment operations is strictly less than *sched_ss_max_repl*, the thread is assigned the priority specified by *sched_priority*; otherwise, the assigned priority shall be *sched_ss_low_priority*. If the value of *sched_priority* is less than or equal to the value of *sched_ss_low_priority*, the results are undefined. When active, the thread shall belong to the thread list corresponding to its assigned priority level, according to the mentioned priority assignment. The modification of the available execution capacity and, consequently of the assigned priority, is done as follows:

1. When the thread at the head of the *sched_priority* list becomes a running thread, its execution time shall be limited to at most its available execution capacity, plus the resolution of the execution time clock used for this scheduling policy. This resolution shall be implementation-defined.

2. Each time the thread is inserted at the tail of the list associated with *sched_priority*—because as a blocked thread it became runnable with priority *sched_priority* or because a replenishment operation was performed—the time at which this operation is done is posted as the *activation_time*.

3. When the running thread with assigned priority equal to *sched_priority* becomes a preempted thread, it becomes the head of the thread list for its priority, and the execution time consumed is subtracted from the available execution capacity. If the available execution capacity would become negative by this operation, it shall be set to zero.

4. When the running thread with assigned priority equal to *sched_priority* becomes a blocked thread, the execution time consumed is subtracted from the available execution capacity, and a replenishment operation is scheduled, as described in 6 and 7. If the available execution capacity would become negative by this operation, it shall be set to zero.

5. When the running thread with assigned priority equal to *sched_priority* reaches the limit imposed on its execution time, it becomes the tail of the thread list for *sched_ss_low_priority*, the execution time consumed is subtracted from the available execution capacity (which becomes zero), and a replenishment operation is scheduled, as described in 6 and 7.

6. Each time a replenishment operation is scheduled, the amount of execution capacity to be replenished, *replenish_amount*, is set equal to the execution time consumed by the thread since the *activation_time*. The replenishment is scheduled to occur at *activation_time* plus *sched_ss_repl_period*. If the scheduled time obtained is before the current time, the replenishment operation is carried out immediately. Several replenishment operations may be pending at the same time, each of which will be serviced at its respective scheduled time. With the above rules, the number of replenishment operations simultaneously pending for a given thread that is scheduled under the sporadic server policy shall not be greater than *sched_ss_max_repl*.

7. A replenishment operation consists of adding the corresponding *replenish_amount* to the available execution capacity at the scheduled time. If, as a consequence of this operation, the execution capacity would become larger than *sched_ss_initial_budget*, it shall be rounded down to a value equal to *sched_ss_initial_budget*. Additionally, if the thread was runnable or running, and had assigned priority equal to *sched_ss_low_priority*, then it becomes the tail of the thread list for *sched_priority*.

Execution time is defined in Section 2.2.2 (on page 513).

For this policy, changing the value of a CPU-time clock via *clock_settime*( ) shall have no effect on its behavior.

For this policy, valid priorities shall be within the range returned by the *sched_get_priority_min*( ) and *sched_get_priority_max*( ) functions when SCHED_SPORADIC is provided as the parameter. Conforming implementations shall provide a priority range of at least 32 distinct priorities for this policy.

SCHED_OTHER

Conforming implementations shall include one scheduling policy identified as SCHED_OTHER (which may execute identically with either the FIFO or round robin scheduling policy). The effect of scheduling threads with the SCHED_OTHER policy in a system in which other threads are executing under SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC is implementation-defined. SS

This policy is defined to allow conforming applications to be able to indicate that they no longer need a realtime scheduling policy in a portable manner.

For threads executing under this policy, the implementation shall use only priorities within the range returned by the *sched_get_priority_max*( ) and *sched_get_priority_min*( ) functions when SCHED_OTHER is provided as the parameter.

2.8.5 Clocks and Timers

TMR The functionality described in this section is dependent on support of the Timers option (and the rest of this section is not further shaded for this option).

The **<time.h>** header defines the types and manifest constants used by the timing facility.

Time Value Specification Structures

Many of the timing facility functions accept or return time value specifications. A time value structure **timespec** specifies a single time value and includes at least the following members:

Member Type	Member Name	Description
time_t	*tv_sec*	Seconds.
long	*tv_nsec*	Nanoseconds.

The *tv_nsec* member is only valid if greater than or equal to zero, and less than the number of nanoseconds in a second (1,000 million). The time interval described by this structure is (*tv_sec* * 10^9 + *tv_nsec*) nanoseconds.

A time value structure **itimerspec** specifies an initial timer value and a repetition interval for use by the per-process timer functions. This structure includes at least the following members:

Member Type	Member Name	Description
struct timespec	*it_interval*	Timer period.
struct timespec	*it_value*	Timer expiration.

If the value described by *it_value* is non-zero, it indicates the time to or time of the next timer expiration (for relative and absolute timer values, respectively). If the value described by *it_value* is zero, the timer shall be disarmed.

If the value described by *it_interval* is non-zero, it specifies an interval to be used in reloading the timer when it expires; that is, a periodic timer is specified. If the value described by *it_interval* is zero, the timer is disarmed after its next expiration; that is, a one-shot timer is specified.

Timer Event Notification Control Block

RTS Per-process timers may be created that notify the process of timer expirations by queuing a realtime extended signal. The **sigevent** structure, defined in the Base Definitions volume of IEEE Std. 1003.1-200x, **<signal.h>**, is used in creating such a timer. The **sigevent** structure contains the signal number and an application-specific data value to be used when notifying the calling process of timer expiration events.

Manifest Constants

The following constants are defined in the Base Definitions volume of IEEE Std. 1003.1-200x, **<time.h>**:

CLOCK_REALTIME The identifier for the system-wide realtime clock.

TIMER_ABSTIME Flag indicating time is absolute with respect to the clock associated with a timer.

MON CLOCK_MONOTONIC The identifier for the system-wide monotonic clock, which is defined as a clock whose value cannot be set via *clock_settime*( ) and which cannot have backward clock jumps. The maximum possible clock jump is implementation-defined.

MON The maximum allowable resolution for the CLOCK_REALTIME and the CLOCK_MONOTONIC clocks and all time services based on these clocks is represented by {_POSIX_CLOCKRES_MIN} and is defined as 20ms (1/50 of a second). Implementations may support smaller values of resolution for these clocks to provide finer granularity time bases. The actual resolution supported by an implementation for a specific clock is obtained using the *clock_getres*( ) function. If the actual resolution supported for a time service based on one of these clocks differs from the resolution supported for that clock, the implementation shall document this difference.

MON The minimum allowable maximum value for the CLOCK_REALTIME and the CLOCK_MONOTONIC clocks and all absolute time services based on them is the same as that defined by the ISO C standard for the **time_t** type. If the maximum value supported by a time service based on one of these clocks differs from the maximum value supported by that clock, the implementation shall document this difference.

Execution Time Monitoring

CPT If _POSIX_CPUTIME is defined, process CPU-time clocks shall be supported in addition to the clocks described in **Manifest Constants**.

TCT If _POSIX_THREAD_CPUTIME is defined, thread CPU-time clocks shall be supported.

CPT|TCT CPU-time clocks measure execution or CPU time, which is defined in the Base Definitions volume of IEEE Std. 1003.1-200x, Section 3.120, CPU Time (Execution Time). The mechanism used to measure execution time is described in the Base Definitions volume of IEEE Std. 1003.1-200x, Section 4.7, Measurement of Execution Time.

CPT If _POSIX_CPUTIME is defined, the following constant of the type **clockid_t** shall be defined in **<time.h>**:

CLOCK_PROCESS_CPUTIME_ID
When this value of the type **clockid_t** is used in a *clock*( ) or *timer**( ) function call, it is interpreted as the identifier of the CPU-time clock associated with the process making the function call.

2219 TCT If _POSIX_THREAD_CPUTIME is defined, the following constant of the type **clockid_t** shall be
2220 defined in **<time.h>**:

2221 CLOCK_THREAD_CPUTIME_ID
2222 When this value of the type **clockid_t** is used in a *clock*() or *timer**() function call, it is
2223 interpreted as the identifier of the CPU-time clock associated with the thread making the
2224 function call.
2225

2.9 Threads

THR The functionality described in this section is dependent on support of the Threads option (and the rest of this section is not further shaded for this option).

This section defines functionality to support multiple flows of control, called *threads*, within a process. For the definition of *threads*, see the Base Definitions volume of IEEE Std. 1003.1-200x, Section 3.395, Thread.

The specific functional areas covered by threads and their scope includes:

- Thread management: the creation, control, and termination of multiple flows of control in the same process under the assumption of a common shared address space
- Synchronization primitives optimized for tightly coupled operation of multiple control flows in a common, shared address space

2.9.1 Thread-Safety

All functions defined by this volume of IEEE Std. 1003.1-200x shall be thread-safe, except that the following functions need not be thread-safe.

asctime( )	*gethostbyname*( )	*getprotobynumber*( )	*inet_ntoa*( )	*ttyname*( )
ctime( )	*gethostent*( )	*getprotoent*( )	*localtime*( )	*unsetenv*( )
getc_unlocked( )	*getlogin*( )	*getpwnam*( )	*putc_unlocked*( )	*wcstombs*( )
getchar_unlocked( )	*getnetbyaddr*( )	*getpwuid*( )	*putchar_unlocked*( )	*wctomb*( )
getenv( )	*getnetbyname*( )	*getservbyname*( )	*rand*( )	
getgrgid( )	*getnetent*( )	*getservbyport*( )	*readdir*( )	
getgrnam( )	*getopt*( )	*getservent*( )	*setenv*( )	
gethostbyaddr( )	*getprotobyname*( )	*gmtime*( )	*strtok*( )	

XSI

basename( )	*dbm_open*( )	*fcvt*( )	*hdestroy*( )	*setgrent*( )
catgets( )	*dbm_store*( )	*gcvt*( )	*hsearch*( )	*setkey*( )
crypt( )	*dirname*( )	*getdate*( )	*l64a*( )	*setpwent*( )
dbm_clearerr( )	*dlerror*( )	*getenv*( )	*lgamma*( )	*setutxent*( )
dbm_close( )	*drand48*( )	*getgrent*( )	*lrand48*( )	*strerror*( )
dbm_delete( )	*ecvt*( )	*getpwent*( )	*mrand48*( )	
dbm_error( )	*encrypt*( )	*getutxent*( )	*nl_langinfo*( )	
dbm_fetch( )	*endgrent*( )	*getutxid*( )	*ptsname*( )	
dbm_firstkey( )	*endpwent*( )	*getutxline*( )	*putenv*( )	
dbm_nextkey( )	*endutxent*( )	*hcreate*( )	*pututxline*( )	

The *read*( ) function need not be thread-safe when reading from a pipe, FIFO, socket, or terminal device.

Note: While a read from a pipe of {PIPE_MAX}*2 bytes may not generate a single atomic and thread-safe stream of bytes, it should generate ‘‘several’’ (individually atomic) thread-safe streams of bytes. Similiarly, while reading from a terminal device may not generate a single atomic and thread-safe stream of bytes, it should generate some finite number of (individually atomic) and thread-safe streams of bytes. That is, concurrent calls to read for a pipe, FIFO, or terminal device are not allowed to result in corrupting the stream of bytes or other internal data. However, *read*( ), in these cases, is not required to return a single contiguous and atomic stream of bytes.

The *ctermid*( ) and *tmpnam*( ) functions need not be thread-safe if passed a NULL argument. The *wcrtomb*( ) and *wcsrtombs*( ) functions need not be thread-safe if passed a NULL *ps* argument.

Implementations shall provide internal synchronization as necessary in order to satisfy this requirement.

2.9.2 Thread IDs

Although implementations may have thread IDs that are unique in a system, applications should only assume that thread IDs are usable and unique within a single process. The effect of calling any of the functions defined in this volume of IEEE Std. 1003.1-200x and passing as an argument the thread ID of a thread from another process is unspecified. A conforming implementation is free to reuse a thread ID after the thread terminates if it was created with the *detachstate* attribute set to PTHREAD_CREATE_DETACHED or if *pthread_detach*( ) or *pthread_join*( ) has been called for that thread. If a thread is detached, its thread ID is invalid for use as an argument in a call to *pthread_detach*( ) or *pthread_join*( ).

2.9.3 Thread Mutexes

A thread that has blocked shall not prevent any unblocked thread that is eligible to use the same processing resources from eventually making forward progress in its execution. Eligibility for processing resources is determined by the scheduling policy.

A thread becomes the owner of a mutex, *m*, when one of the following occurs:

- It returns successfully from *pthread_mutex_lock*( ) with *m* as the *mutex* argument.
- It returns successfully from *pthread_mutex_trylock*( ) with *m* as the *mutex* argument.
- TMO It returns successfully from *pthread_mutex_timedwait*( ) with *m* as the mutex argument.
- It returns (successfully or not) from *pthread_cond_wait*( ) with *m* as the *mutex* argument (except as explicitly indicated otherwise for certain errors).
- It returns (successfully or not) from *pthread_cond_timedwait*( ) with *m* as the *mutex* argument (except as explicitly indicated otherwise for certain errors).

The thread remains the owner of *m* until one of the following occurs:

- It executes *pthread_mutex_unlock*( ) with *m* as the *mutex* argument
- It blocks in a call to *pthread_cond_wait*( ) with *m* as the *mutex* argument.
- It blocks in a call to *pthread_cond_timedwait*( ) with *m* as the *mutex* argument.

The implementation behaves as if at all times there is at most one owner of any mutex.

A thread that becomes the owner of a mutex is said to have *acquired* the mutex and the mutex is said to have become *locked*; when a thread gives up ownership of a mutex it is said to have *released* the mutex and the mutex is said to have become *unlocked*.

2.9.4 Thread Scheduling

Thread Scheduling Attributes

Thread scheduling attributes are dependent on support of the Thread Execution Scheduling option.

In support of the scheduling function, threads have attributes which are accessed through the *pthread_attr_t* thread creation attributes object.

The *contentionscope* attribute defines the scheduling contention scope of the thread to be either PTHREAD_SCOPE_PROCESS or PTHREAD_SCOPE_SYSTEM.

The *inheritsched* attribute specifies whether a newly created thread is to inherit the scheduling attributes of the creating thread or to have its scheduling values set according to the other scheduling attributes in the *pthread_attr_t* object.

The *schedpolicy* attribute defines the scheduling policy for the thread. The *schedparam* attribute defines the scheduling parameters for the thread. The interaction of threads having different policies within a process is described as part of the definition of those policies.

If the Thread Execution Scheduling option is defined, and the *schedpolicy* attribute specifies one of the priority-based policies defined under this option, the *schedparam* attribute contains the scheduling priority of the thread. A conforming implementation ensures that the priority value in *schedparam* is in the range associated with the scheduling policy when the thread attributes object is used to create a thread, or when the scheduling attributes of a thread are dynamically modified. The meaning of the priority value in *schedparam* is the same as that of *priority*.

TSP If _POSIX_THREAD_SPORADIC_SERVER is defined, the *schedparam* attribute supports four new members that are used for the sporadic server scheduling policy. These members are *sched_ss_low_priority*, *sched_ss_repl_period*, *sched_ss_init_budget*, and *sched_ss_max_repl*. The meaning of these attributes is the same as in the definitions that appear under Section 2.8.4 (on page 546).

When a process is created, its single thread has a scheduling policy and associated attributes equal to the process' policy and attributes. The default scheduling contention scope value is implementation-defined. The default values of other scheduling attributes are implementation-defined.

Thread Scheduling Contention Scope

The scheduling contention scope of a thread defines the set of threads with which the thread competes for use of the processing resources. The scheduling operation selects at most one thread to execute on each processor at any point in time and the thread's scheduling attributes (for example, *priority*), whether under process scheduling contention scope or system scheduling contention scope, are the parameters used to determine the scheduling decision.

The scheduling contention scope, in the context of scheduling a mixed scope environment, effects threads as follows:

- A thread created with PTHREAD_SCOPE_SYSTEM scheduling contention scope contends for resources with all other threads in the same scheduling allocation domain relative to their system scheduling attributes. The system scheduling attributes of a thread created with PTHREAD_SCOPE_SYSTEM scheduling contention scope are the scheduling attributes with which the thread was created. The system scheduling attributes of a thread created with PTHREAD_SCOPE_PROCESS scheduling contention scope are the implementation-defined mapping into system attribute space of the scheduling attributes with which the thread was

created.

- Threads created with PTHREAD_SCOPE_PROCESS scheduling contention scope contend directly with other threads within their process that were created with PTHREAD_SCOPE_PROCESS scheduling contention scope. The contention is resolved based on the threads' scheduling attributes and policies. It is unspecified how such threads are scheduled relative to threads in other processes or threads with PTHREAD_SCOPE_SYSTEM scheduling contention scope.
- Conforming implementations shall support the PTHREAD_SCOPE_PROCESS scheduling contention scope, the PTHREAD_SCOPE_SYSTEM scheduling contention scope, or both.

Scheduling Allocation Domain

Implementations shall support scheduling allocation domains containing one or more processors. It should be noted that the presence of multiple processors does not automatically indicate a scheduling allocation domain size greater than one. Conforming implementations on multiprocessors may map all or any subset of the CPUs to one or multiple scheduling allocation domains, and could define these scheduling allocation domains on a per-thread, per-process, or per-system basis, depending on the types of applications intended to be supported by the implementation. The scheduling allocation domain is independent of scheduling contention scope, as the scheduling contention scope merely defines the set of threads with which a thread contends for processor resources, while scheduling allocation domain defines the set of processors for which it contends. The semantics of how this contention is resolved among threads for processors is determined by the scheduling policies of the threads.

The choice of scheduling allocation domain size and the level of application control over scheduling allocation domains is implementation-defined. Conforming implementations may change the size of scheduling allocation domains and the binding of threads to scheduling allocation domains at any time.

For application threads with scheduling allocation domains of size equal to one, the scheduling rules defined for SCHED_FIFO and SCHED_RR shall be used; see **Scheduling Policies** (on page 546). All threads with system scheduling contention scope, regardless of the processes in which they reside, compete for the processor according to their priorities. Threads with process scheduling contention scope compete only with other threads with process scheduling contention scope within their process.

For application threads with scheduling allocation domains of size greater than one, the rules TSP defined for SCHED_FIFO, SCHED_RR, and SCHED_SPORADIC shall be used in an implementation-defined manner. Each thread with system scheduling contention scope competes for the processors in its scheduling allocation domain in an implementation-defined manner according to its priority. Threads with process scheduling contention scope are scheduled relative to other threads within the same scheduling contention scope in the process.

TSP If _POSIX_THREAD_SPORADIC_SERVER is defined, the rules defined for SCHED_SPORADIC in **Scheduling Policies** (on page 546) shall be used in an implementation-defined manner for application threads whose scheduling allocation domain size is greater than one.

Scheduling Documentation

TSP If _POSIX_PRIORITY_SCHEDULING is defined, then any scheduling policies beyond SCHED_OTHER, SCHED_FIFO, SCHED_RR, and SCHED_SPORADIC, as well as the effects of the scheduling policies indicated by these other values, and the attributes required in order to support such a policy, are implementation-defined. Furthermore, the implementation shall document the effect of all processor scheduling allocation domain values supported for these policies.

2.9.5 Thread Cancelation

The thread cancelation mechanism allows a thread to terminate the execution of any other thread in the process in a controlled manner. The target thread (that is, the one that is being canceled) is allowed to hold cancelation requests pending in a number of ways and to perform application-specific cleanup processing when the notice of cancelation is acted upon.

Cancelation is controlled by the cancelation control functions. Each thread maintains its own cancelability state. Cancelation may only occur at cancelation points or when the thread is asynchronously cancelable.

The thread cancelation mechanism described in this section depends upon programs having set *deferred cancelability* state, which is specified as the default. Applications shall also carefully follow static lexical scoping rules in their execution behavior. For example, use of *setjmp*( ), *return*, *goto*, and so on, to leave user-defined cancelation scopes without doing the necessary scope pop operation results in undefined behavior.

Use of asynchronous cancelability while holding resources which potentially need to be released may result in resource loss. Similarly, cancelation scopes may only be safely manipulated (pushed and popped) when the thread is in the *deferred* or *disabled* cancelability states.

2.9.5.1 Cancelability States

The cancelability state of a thread determines the action taken upon receipt of a cancelation request. The thread may control cancelation in a number of ways.

Each thread maintains its own cancelability state, which may be encoded in two bits:

1. Cancelability-Enable: When cancelability is PTHREAD_CANCEL_DISABLE (as defined in the Base Definitions volume of IEEE Std. 1003.1-200x, **<pthread.h>**), cancelation requests against the target thread are held pending. By default, cancelability is set to PTHREAD_CANCEL_ENABLE (as defined in **<pthread.h>**).

2. Cancelability Type: When cancelability is enabled and the cancelability type is PTHREAD_CANCEL_ASYNCHRONOUS (as defined in **<pthread.h>**), new or pending cancelation requests may be acted upon at any time. When cancelability is enabled and the cancelability type is PTHREAD_CANCEL_DEFERRED (as defined in **<pthread.h>**), cancelation requests are held pending until a cancelation point (see below) is reached. If cancelability is disabled, the setting of the cancelability type has no immediate effect as all cancelation requests are held pending; however, once cancelability is enabled again the new type is in effect. The cancelability type is PTHREAD_CANCEL_DEFERRED in all newly created threads including the thread in which *main*( ) was first invoked.

2.9.5.2 Cancelation Points

Cancelation points occur when a thread is executing the following functions:

accept( )	*mq_timedsend*( )	*putpmsg*( )	*sigsuspend*( )
aio_suspend( )	*msgrcv*( )	*pwrite*( )	*sigtimedwait*( )
clock_nanosleep( )	*msgsnd*( )	*read*( )	*sigwait*( )
close( )	*msync*( )	*readv*( )	*sigwaitinfo*( )
connect( )	*nanosleep*( )	*recv*( )	*sleep*( )
creat( )	*open*( )	*recvfrom*( )	*system*( )
fcntl( )[1]	*pause*( )	*recvmsg*( )	*tcdrain*( )
fsync( )	*poll*( )	*select*( )	*usleep*( )
getmsg( )	*pread*( )	*sem_timedwait*( )	*wait*( )
getpmsg( )	*pthread_cond_timedwait*( )	*sem_wait*( )	*waitid*( )
lockf( )	*pthread_cond_wait*( )	*send*( )	*waitpid*( )
mq_receive( )	*pthread_join*( )	*sendmsg*( )	*write*( )
mq_send( )	*pthread_testcancel*( )	*sendto*( )	*writev*( )
mq_timedreceive( )	*putmsg*( )	*sigpause*( )	

1. When the *cmd* argument is F_SETLKW.

A cancelation point may also occur when a thread is executing the following functions:

An implementation shall not introduce cancelation points into any other functions specified in this volume of IEEE Std. 1003.1-200x.

---

2. For any value of the *cmd* argument.

The side effects of acting upon a cancelation request while suspended during a call of a function are the same as the side effects that may be seen in a single-threaded program when a call to a function is interrupted by a signal and the given function returns [EINTR]. Any such side effects occur before any cancelation cleanup handlers are called.

Whenever a thread has cancelability enabled and a cancelation request has been made with that thread as the target and the thread calls *pthread_testcancel*( ), then the cancelation request is acted upon before *pthread_testcancel*( ) returns. If a thread has cancelability enabled and the thread has a cancelation request pending and the thread is suspended at a cancelation point waiting for an event to occur, then the cancelation request shall be acted upon. However, if the thread is suspended at a cancelation point and the event that it is waiting for occurs before the cancelation request is acted upon, it is unspecified whether the cancelation request is acted upon or whether the request remains pending and the thread resumes normal execution.

2.9.5.3 Thread Cancelation Cleanup Handlers

Each thread maintains a list of cancelation cleanup handlers. The programmer uses the *pthread_cleanup_push*( ) and *pthread_cleanup_pop*( ) functions to place routines on and remove routines from this list.

When a cancelation request is acted upon, the routines in the list are invoked one by one in LIFO sequence; that is, the last routine pushed onto the list (Last In) is the first to be invoked (First Out). The thread invokes the cancelation cleanup handler with cancelation disabled until the last cancelation cleanup handler returns. When the cancelation cleanup handler for a scope is invoked, the storage for that scope remains valid. If the last cancelation cleanup handler returns, thread execution is terminated and a status of PTHREAD_CANCELED is made available to any threads joining with the target. The symbolic constant PTHREAD_CANCELED expands to a constant expression of type (**void***) whose value matches no pointer to an object in memory nor the value NULL.

The cancelation cleanup handlers are also invoked when the thread calls *pthread_exit*( ).

A side effect of acting upon a cancelation request while in a condition variable wait is that the mutex is re-acquired before calling the first cancelation cleanup handler. In addition, the thread is no longer considered to be waiting for the condition and the thread shall not have consumed any pending condition signals on the condition.

A cancelation cleanup handler cannot exit via *longjmp*( ) or *siglongjmp*( ).

2.9.5.4 Async-Cancel Safety

The *pthread_cancel*( ), *pthread_setcancelstate*( ), and *pthread_setcanceltype*( ) functions are defined to be async-cancel safe.

No other functions in this volume of IEEE Std. 1003.1-200x are required to be async-cancel-safe.

2.9.6 Thread Read-Write Locks

Multiple readers, single writer (read-write) locks allow many threads to have simultaneous read-only access to data while allowing only one thread to have exclusive write access at any given time. They are typically used to protect data that is read-only more frequently than it is changed.

One or more readers acquire read access to the resource by performing a read lock operation on the associated read-write lock. A writer acquires exclusive write access by performing a write lock operation. Basically, all readers exclude any writers and a writer excludes all readers and any other writers.

A thread that has blocked on a read-write lock (for example, has not yet returned from a *pthread_rwlock_rdlock*( ) or *pthread_rwlock_wrlock*( ) call) shall not prevent any unblocked thread that is eligible to use the same processing resources from eventually making forward progress in its execution. Eligibility for processing resources shall be determined by the scheduling policy.

Read-write locks can be used to synchronize threads in the current process and other processes if they are allocated in memory that is writable and shared among the cooperating processes and have been initialized for this behavior.

2.9.7 Thread Interactions with Regular File Operations

All of the functions *chmod*( ), *close*( ), *fchmod*( ), *fcntl*( ), *fstat*( ), *ftruncate*( ), *lseek*( ), *open*( ), *read*( ), *readlink*( ), *stat*( ), *symlink*( ), and *write*( ) shall be atomic with respect to each other in the effects specified in IEEE Std. 1003.1-200x when they operate on regular files. If two threads each call one of these functions, each call shall either see all of the specified effects of the other call, or none of them.

2.10 Sockets

A socket is an endpoint for communication using the facilities described in this section. A socket is created with a specific socket type, described in Section 2.10.6 (on page 563), and is associated with a specific protocol, detailed in Section 2.10.2. A socket is accessed via a file descriptor obtained when the socket is created.

2.10.1 Protocol Families

All network protocols are associated with a specific protocol family. A protocol family provides basic services to the protocol implementation to allow it to function within a specific network environment. These services may include packet fragmentation and reassembly, routing, addressing, and basic transport. A protocol family may support multiple methods of addressing. Each method represents an address family. A protocol family is normally comprised of a number of protocols, one per socket type. Each protocol is characterized by an abstract socket type. It is not required that a protocol family support all socket types. A protocol family may contain multiple protocols supporting the same socket abstraction.

Section 2.10.17 (on page 569), Section 2.10.18 (on page 569), and Section 2.10.19 (on page 570), respectively, describe the use of sockets for local UNIX connections, for Internet protocols based on IPv4, and for Internet protocols based on IPv6.

2.10.2 Protocols

A protocol supports one of the socket abstractions detailed in Section 2.10.6 (on page 563). Selecting a protocol involves specifying the protocol family, socket type, and protocol number to the *socket*( ) function. Protocols normally accept only one type of address format, usually determined by the addressing structure inherent in the design of the protocol family/network architecture. Certain semantics of the basic socket abstractions are protocol-specific. All protocols are expected to support the basic model for their particular socket type, but may, in addition, provide non-standard facilities or extensions to a mechanism.

2.10.3 Addressing

Associated with each protocol family is at least one address family. An address family defines the format of a socket address. All network addresses are described using a general structure, called a **sockaddr**, as defined in the Base Definitions volume of IEEE Std. 1003.1-200x, **<sys/socket.h>**. However, each address family imposes finer and more specific structure, generally defining a structure with fields specific to the address family. The field *sa_family* in the **sockaddr** structure contains the address family identifier, specifying the format of the *sa_data* area. The size of the *sa_data* area is unspecified.

2.10.4 Routing

Sockets provides packet routing facilities. A routing information database is maintained, which is used in selecting the appropriate network interface when transmitting packets.

2.10.5 Interfaces

Each network interface in a system corresponds to a path through which messages can be sent and received. A network interface usually has a hardware device associated with it, though certain interfaces such as the loopback interface, do not.

2.10.6 Socket Types

A socket is created with a specific type, which defines the communication semantics and which allows the selection of an appropriate communication protocol. Three types are defined: SOCK_STREAM, SOCK_SEQPACKET, and SOCK_DGRAM. Implementations may specify additional socket types.

The SOCK_STREAM socket type provides reliable, sequenced, full-duplex octet streams between the socket and a peer to which the socket is connected. A socket of type SOCK_STREAM must be in a connected state before any data may be sent or received. Record boundaries are not maintained; data sent on a stream socket using output operations of one size may be received using input operations of smaller or larger sizes without loss of data. Data may be buffered; successful return from an output function does not imply that the data has been delivered to the peer or even transmitted from the local system. If data cannot be successfully transmitted within a given time then the connection is considered broken, and subsequent operations shall fail. A SIGPIPE signal is raised if a thread sends on a broken stream (one that is no longer connected). Support for an out-of-band data transmission facility is protocol-specific.

The SOCK_SEQPACKET socket type is similar to the SOCK_STREAM type, and is also connection-oriented. The only difference between these types is that record boundaries are maintained using the SOCK_SEQPACKET type. A record can be sent using one or more output operations and received using one or more input operations, but a single operation never transfers parts of more than one record. Record boundaries are visible to the receiver via the MSG_EOR flag in the received message flags returned by the *recvmsg*( ) function. It is protocol-specific whether a maximum record size is imposed.

The SOCK_DGRAM socket type supports connectionless data transfer which is not necessarily acknowledged or reliable. Datagrams may be sent to a peer named in each output operation, and incoming datagrams may be received from multiple sources. The source address of each datagram is available when receiving the datagram. An application may also pre-specify a peer address, in which case calls to output functions shall send to the pre-specified peer. If a peer has been specified, only datagrams from that peer shall be received. A datagram must be sent in a single output operation, and must be received in a single input operation. The maximum size of a datagram is protocol-specific; with some protocols, the limit is implementation-defined. Output datagrams may be buffered within the system; thus, a successful return from an output function does not guarantee that a datagram is actually sent or received. However, implementations should attempt to detect any errors possible before the return of an output function, reporting any error by an unsuccessful return value.

2.10.7 Socket I/O Mode

The I/O mode of a socket is described by the O_NONBLOCK file status flag which pertains to the open file description for the socket. This flag is initially off when a socket is created, but may be set and cleared by the use of the F_SETFL command of the *fcntl*( ) function.

When the O_NONBLOCK flag is set, functions that would normally block until they are complete either return immediately with an error, or they complete asynchronously to the execution of the calling process. Data transfer operations (the *read*( ), *write*( ), *send*( ), and *recv*( ) functions) complete immediately, transfer only as much as is available, and then return without blocking, or return an error indicating that no transfer could be made without blocking. The

connect( ) function initiates a connection and returns without blocking when O_NONBLOCK is set; it returns the error [EINPROGRESS] to indicate that the connection was initiated successfully, but that it has not yet completed.

2.10.8 Socket Owner

The owner of a socket is unset when a socket is created. The owner may be set to a process ID or process group ID using the F_SETOWN command of the *fcntl*( ) function.

2.10.9 Socket Queue Limits

The transmit and receive queue sizes for a socket are set when the socket is created. The default sizes used are both protocol-specific and implementation-defined. The sizes may be changed using the *setsockopt*( ) function.

2.10.10 Pending Error

Errors may occur asynchronously, and be reported to the socket in response to input from the network protocol. The socket stores the pending error to be reported to a user of the socket at the next opportunity. The error is returned in response to a subsequent *send*( ), *recv*( ), or *getsockopt*( ) operation on the socket, and the pending error is then cleared.

2.10.11 Socket Receive Queue

A socket has a receive queue that buffers data when they are received by the system until they are removed by a receive call. Depending on the type of the socket and the communication provider, the receive queue may also contain ancillary data such as the addressing and other protocol data associated with the normal data in the queue, and may contain out-of-band or expedited data. The limit on the queue size includes any normal, out-of-band data, datagram source addresses, and ancillary data in the queue. The description in this section applies to all sockets, even though some elements cannot be present in some instances.

The contents of a receive buffer are logically structured as a series of data segments with associated ancillary data and other information. A data segment may contain normal data or out-of-band data, but never both. A data segment may complete a record if the protocol supports records (always true for types SOCK_SEQPACKET and SOCK_DGRAM). A record may be stored as more than one segment; the complete record might never be present in the receive buffer at one time, as a portion might already have been returned to the application, and another portion might not yet have been received from the communications provider. A data segment may contain ancillary protocol data, which is logically associated with the segment. Ancillary data is received as if it were queued along with the first normal data octet in the segment (if any). A segment may contain ancillary data only, with no normal or out-of-band data. For the purposes of this section, a datagram is considered to be a data segment that terminates a record, and that includes a source address as a special type of ancillary data. Data segments are placed into the queue as data is delivered to the socket by the protocol. Normal data segments are placed at the end of the queue as they are delivered. If a new segment contains the same type of data as the preceding segment and includes no ancillary data, and if the preceding segment does not terminate a record, the segments are logically merged into a single segment.

The receive queue is logically terminated if an end-of-file indication has been received or a connection has been terminated. A segment shall be considered to be terminated if another segment follows it in the queue, if the segment completes a record, or if an end-of-file or other connection termination has been reported. The last segment in the receive queue shall also be considered to be terminated while the socket has a pending error to be reported.

A receive operation shall never return data or ancillary data from more than one segment.

2.10.12 Socket Out-of-Band Data State

The handling of received out-of-band data is protocol-specific. Out-of-band data may be placed in the socket receive queue, either at the end of the queue or before all normal data in the queue. In this case, out-of-band data is returned to an application program by a normal receive call. Out-of-band data may also be queued separately rather than being placed in the socket receive queue, in which case it shall be returned only in response to a receive call that requests out-of-band data. It is protocol-specific whether an out-of-band data mark is placed in the receive queue to demarcate data preceding the out-of-band data and following the out-of-band data. An out-of-band data mark is logically an empty data segment that cannot be merged with other segments in the queue. An out-of-band data mark is never returned in response to an input operation. The *sockatmark*( ) function can be used to test whether an out-of-band data mark is the first element in the queue. If an out-of-band data mark is the first element in the queue when an input function is called without the MSG_PEEK option, the mark is removed from the queue and the following data (if any) are processed as if the mark had not been present.

2.10.13 Connection Indication Queue

Sockets that are used to accept incoming connections maintain a queue of outstanding connection indications. This queue is a list of connections that are awaiting acceptance by the application. See *listen*( ).

2.10.14 Signals

One category of event at the socket interface is the generation of signals. These signals report protocol events or process errors relating to the state of the socket. The generation or delivery of a signal does not change the state of the socket, although the generation of the signal may have been caused by a state change.

The SIGPIPE signal shall be sent to a thread that attempts to send data on a socket that is no longer able to send. In addition, the send operation fails with the error [EPIPE].

If a socket has an owner, the SIGURG signal is sent to the owner of the socket when it is notified of expedited or out-of-band data. The socket state at this time is protocol-dependent, and the status of the socket is specified in Section 2.10.17 (on page 569), Section 2.10.18 (on page 569), and Section 2.10.19 (on page 570). Depending on the protocol, the expedited data may or may not have arrived at the time of signal generation.

2.10.15 Asynchronous Errors

If any of the following conditions occur asynchronously for a socket, the corresponding value listed below shall become the pending error for the socket:

[ECONNABORTED]
The connection was aborted locally.

[ECONNREFUSED]
For a connection-mode socket attempting a non-blocking connection, the attempt to connect was forcefully rejected. For a connectionless-mode socket, an attempt to deliver a datagram was forcefully rejected.

[ECONNRESET]
The peer has aborted the connection.

[EHOSTDOWN]
The destination host has been determined to be down or disconnected.

[EHOSTUNREACH]
The destination host is not reachable.

[EMSGSIZE]
For a connectionless-mode socket, the size of a previously sent datagram prevented delivery.

[ENETDOWN]
The local network connection is not operational.

[ENETRESET]
The connection was aborted by the network.

[ENETUNREACH]
The destination network is not reachable.

2.10.16 Use of Options

There are a number of socket options which either specialize the behavior of a socket or provide useful information. These options may be set at different protocol levels and are always present at the uppermost ‘‘socket’’ level.

Socket options are manipulated by two functions, *getsockopt*( ) and *setsockopt*( ). These functions allow an application program to customize the behavior and characteristics of a socket to provide the desired effect.

All of the options have default values. The type and meaning of these values is defined by the protocol level to which they apply. Instead of using the default values, an application program may choose to customize one or more of the options. However, in the bulk of cases, the default values are sufficient for the application.

Some of the options are used to enable or disable certain behavior within the protocol modules (for example, turn on debugging) while others may be used to set protocol-specific information (for example, IP time-to-live on all the application’s outgoing packets). As each of the options is introduced, its effect on the underlying protocol modules is described.

Table 2-4 shows the value for the socket level.

Table 2-4 Value of Level for Socket Options

Name	Description
SOL_SOCKET	Options are intended for the sockets level.

Table 2-5 (on page 567) lists those options present at the socket level; that is, when the *level* parameter of the *getsockopt*( ) or *setsockopt*( ) function is SOL_SOCKET, the types of the option value parameters associated with each option, and a brief synopsis of the meaning of the option value parameter. Unless otherwise noted, each may be examined with *getsockopt*( ) and set with *setsockopt*( ) on all types of socket.

Table 2-5 Socket-Level Options

Option	Parameter Type	Parameter Meaning
SO_BROADCAST	(**void** *) **int**	Non-zero requests permission to transmit broadcast datagrams (SOCK_DGRAM sockets only).
SO_DEBUG	**int**	Non-zero requests debugging in underlying protocol modules.
SO_DONTROUTE	**int**	Non-zero requests bypass of normal routing; route based on destination address only.
SO_ERROR	**int**	Requests and clears pending error information on the socket (*getsockopt*( ) only).
SO_KEEPALIVE	**int**	Non-zero requests periodic transmission of keepalive messages (protocol-specific).
SO_LINGER	**struct linger**	Specify actions to be taken for queued, unsent data on *close*( ): linger on/off and linger time in seconds.
SO_OOBINLINE	**int**	Non-zero requests that out-of-band data be placed into normal data input queue as received.
SO_RCVBUF	**int**	Size of receive buffer (in bytes).
SO_RCVLOWAT	**int**	Minimum amount of data to return to application for input operations (in bytes).
SO_RCVTIMEO	**struct timeval**	Timeout value for a socket receive operation.
SO_REUSEADDR	**int**	Non-zero requests reuse of local addresses in *bind*( ) (protocol-specific).
SO_SNDBUF	**int**	Size of send buffer (in bytes).
SO_SNDLOWAT	**int**	Minimum amount of data to send for output operations (in bytes).
SO_SNDTIMEO	**struct timeval**	Timeout value for a socket send operation.
SO_TYPE	**int**	Identify socket type (*getsockopt*( ) only).

The SO_BROADCAST option requests permission to send broadcast datagrams on the socket. Support for SO_BROADCAST is protocol-specific. The default for SO_BROADCAST is that the ability to send broadcast datagrams on a socket is disabled.

SO_DEBUG enables debugging in the underlying protocol modules. This can be useful for tracing the behavior of the underlying protocol modules during normal system operation. The semantics of the debug reports are implementation-defined. The default value for SO_DEBUG is for debugging to be turned off.

SO_DONTROUTE requests that outgoing messages bypass the standard routing facilities. The destination must be on a directly-connected network, and messages are directed to the appropriate network interface according to the destination address. It is protocol-specific whether this option has any effect and how the outgoing network interface is chosen. Support for this option with each protocol is implementation-defined.

SO_ERROR is used only on *getsockopt*( ). When this option is specified, *getsockopt*( ) returns any pending error on the socket and clears the error status. It returns a value of 0 if there is no pending error. SO_ERROR may be used to check for asynchronous errors on connected connectionless-mode sockets or for other types of asynchronous errors. SO_ERROR has no default value.

SO_KEEPALIVE enables the periodic transmission of messages on a connected socket. The behavior of this option is protocol-specific. The default value for SO_KEEPALIVE is zero, specifying that this capability is turned off.

The SO_LINGER option controls the action of the interface when unsent messages are queued on a socket and a *close*( ) is performed. The details of this option are protocol-specific. The default value for SO_LINGER is zero, or off, for the *l_onoff* element of the option value and zero seconds for the linger time specified by the *l_linger* element.

SO_OOBINLINE is valid only on protocols that support out-of-band data. The SO_OOBINLINE option requests that out-of-band data be placed in the normal data input queue as received; it is then accessible using the *read*( ) or *recv*( ) functions without the MSG_OOB flag set. The default for SO_OOBINLINE is off; that is, for out-of-band data not to be placed in the normal data input queue.

SO_RCVBUF requests that the buffer space allocated for receive operations on this socket be set to the value, in bytes, of the option value. Applications may wish to increase buffer size for high volume connections, or may decrease buffer size to limit the possible backlog of incoming data. The default value for the SO_RCVBUF option value is implementation-defined, and may vary by protocol.

The maximum value for the option for a socket may be obtained by the use of the *fpathconf*( ) function, using the value _PC_SOCK_MAXBUF.

SO_RCVLOWAT sets the minimum number of bytes to process for socket input operations. In general, receive calls block until any (non-zero) amount of data is received, then return the smaller of the amount available or the amount requested. The default value for SO_RCVLOWAT is 1, and does not affect the general case. If SO_RCVLOWAT is set to a larger value, blocking receive calls normally wait until they have received the smaller of the low water mark value or the requested amount. Receive calls may still return less than the low water mark if an error occurs, a signal is caught, or the type of data next in the receive queue is different than that returned (for example, out-of-band data). As mentioned previously, the default value for SO_RCVLOWAT is 1 byte. It is implementation-defined whether the SO_RCVLOWAT option can be set.

SO_RCVTIMEO is an option to set a timeout value for input operations. It accepts a **timeval** structure with the number of seconds and microseconds specifying the limit on how long to wait for an input operation to complete. If a receive operation has blocked for this much time without receiving additional data, it returns with a partial count or *errno* set to [EWOULDBLOCK] if no data were received. The default for this option is the value zero, which indicates that a receive operation will not timeout. It is implementation-defined whether the SO_RCVTIMEO option can be set.

SO_REUSEADDR indicates that the rules used in validating addresses supplied in a *bind*( ) should allow reuse of local addresses. Operation of this option is protocol-specific. The default value for SO_REUSEADDR is off; that is, reuse of local addresses is not permitted.

SO_SNDBUF requests that the buffer space allocated for send operations on this socket be set to the value, in bytes, of the option value. The default value for the SO_SNDBUF option value is implementation-defined, and may vary by protocol. The maximum value for the option for a socket may be obtained by the use of the *fpathconf*( ) function, using the value _PC_SOCK_MAXBUF.

SO_SNDLOWAT sets the minimum number of bytes to process for socket output operations. Most output operations process all of the data supplied by the call, delivering data to the protocol for transmission and blocking as necessary for flow control. Non-blocking output operations process as much data as permitted subject to flow control without blocking, but

process no data if flow control does not allow the smaller of the send low water mark value or the entire request to be processed. A *select*( ) operation testing the ability to write to a socket returns true only if the send low water mark could be processed. The default value for SO_SNDLOWAT is implementation-defined and protocol-specific. It is implementation-defined whether the SO_SNDLOWAT option can be set.

SO_SNDTIMEO is an option to set a timeout value for the amount of time that an output function shall block because flow control prevents data from being sent. As noted in Table 2-5 (on page 567), the option value is a **timeval** structure with the number of seconds and microseconds specifying the limit on how long to wait for an output operation to complete. If a send operation has blocked for this much time, it returns with a partial count or *errno* set to [EWOULDBLOCK] if no data were sent. The default for this option is the value zero, which indicates that a send operation will not timeout. It is implementation-defined whether the SO_SNDTIMEO option can be set.

SO_TYPE is used only on *getsockopt*( ). When this option is specified, *getsockopt*( ) returns the type of the socket (for example, SOCK_STREAM). This option is useful to servers that inherit sockets on start-up. SO_TYPE has no default value.

2.10.17 Use of Sockets for Local UNIX Connections

Support for UNIX domain sockets is mandatory.

UNIX domain sockets provide process-to-process communication in a single system.

2.10.17.1 Headers

Symbolic constant AF_UNIX is defined in the **<sys/socket.h>** header to identify the UNIX domain address family. The **<sys/un.h>** header contains other definitions used in connection with UNIX domain sockets. See the Base Definitions volume of IEEE Std. 1003.1-200x, Chapter 13, Headers.

The **sockaddr_storage** structure defined in **<sys/socket.h>** is large enough to accommodate a **sockaddr_un** structure (see the **<sys/un.h>** header defined in the Base Definitions volume of IEEE Std. 1003.1-200x, Chapter 13, Headers) and is aligned at an appropriate boundary so that pointers to it can be cast as pointers to **sockaddr_un** structures and used to access the fields of those structures without alignment problems. When a **sockaddr_storage** structure is cast as a **sockaddr_un** structure, the *ss_family* field maps onto the *sun_family* field.

2.10.18 Use of Sockets over Internet Protocols Based on IPv4

Support for sockets over Internet protocols based on IPv4 is mandatory.

2.10.18.1 Headers

Symbolic constant AF_INET is defined in the **<sys/socket.h>** header to identify the IPv4 Internet address family. The **<netinet/in.h>** header contains other definitions used in connection with IPv4 Internet sockets. See the Base Definitions volume of IEEE Std. 1003.1-200x, Chapter 13, Headers.

The **sockaddr_storage** structure defined in **<sys/socket.h>** is large enough to accommodate a **sockaddr_in** structure (see the **<netinet/in.h>** header defined in the Base Definitions volume of IEEE Std. 1003.1-200x, Chapter 13, Headers) and is aligned at an appropriate boundary so that pointers to it can be cast as pointers to **sockaddr_in** structures and used to access the fields of those structures without alignment problems. When a **sockaddr_storage** structure is cast as a **sockaddr_in** structure, the *ss_family* field maps onto the *sin_family* field.

2.10.19 Use of Sockets over Internet Protocols Based on IPv6

IP6 This section describes extensions to support sockets over Internet protocols based on IPv6. This functionality is dependent on support of the IPV6 option (and the rest of this section is not further shaded for this option).

To enable smooth transition from IPv4 to IPv6, the features defined in this section may, in certain circumstances, also be used in connection with IPv4; see Section 2.10.19.2 (on page 571).

2.10.19.1 Addressing

IPv6 overcomes the addressing limitations of previous versions by using 128-bit addresses instead of 32-bit addresses. The IPv6 address architecture is described in RFC 2373.

There are three kinds of IPv6 address:

Unicast
: Identifies a single interface.

  A unicast address can be global, link-local (designed for use on a single link), or site-local (designed for systems not connected to the Internet). Link-local and site-local addresses need not be globally unique.

Anycast
: Identifies a set of interfaces such that a packet sent to the address can be delivered to any member of the set.

  An anycast address is similar to a unicast address; the nodes to which an anycast address is assigned must be explicitly configured to know that it is an anycast address.

Multicast
: Identifies a set of interfaces such that a packet sent to the address should be delivered to every member of the set.

  An application can send multicast datagrams by simply specifying an IPv6 multicast address in the *address* argument of *sendto*( ). To receive multicast datagrams, an application must join the multicast group (using *setsockopt*( ) with IPV6_JOIN_GROUP) and must bind to the socket the UDP port on which datagrams will be received. Some applications should also bind the multicast group address to the socket, to prevent other datagrams destined to that port from being delivered to the socket.

  A multicast address can be global, node-local, link-local, site-local, or organization-local.

The following special IPv6 addresses are defined:

Unspecified
: An address that is not assigned to any interface and is used to indicate the absence of an address.

Loopback
: A unicast address that is not assigned to any interface and can be used by a node to send packets to itself.

Two sets of IPv6 addresses are defined to correspond to IPv4 addresses:

IPv4-compatible addresses
: These are assigned to nodes that support IPv6 and can be used when traffic is ‘‘tunneled’’ through IPv4.

IPv4-mapped addresses
: These are used to represent IPv4 addresses in IPv6 address format; see Section 2.10.19.2 (on

page 571).

Note that the unspecified address and the loopback address must not be treated as IPv4-compatible addresses.

2.10.19.2 Compatibility with IPv4

The API provides the ability for IPv6 applications to interoperate with applications using IPv4, by using IPv4-mapped IPv6 addresses. These addresses can be generated automatically by the *getipnodebyname*( ) function when the specified host has only IPv4 addresses (as described in *endhostent*( )).

Applications may use AF_INET6 sockets to open TCP connections to IPv4 nodes, or send UDP packets to IPv4 nodes, by simply encoding the destination's IPv4 address as an IPv4-mapped IPv6 address, and passing that address, within a **sockaddr_in6** structure, in the *connect*( ), *sendto*( ) or *sendmsg*( ) function. When applications use AF_INET6 sockets to accept TCP connections from IPv4 nodes, or receive UDP packets from IPv4 nodes, the system returns the peer's address to the application in the *accept*( ), *recvfrom*( ), *recvmsg*( ), or *getpeername*( ) function using a **sockaddr_in6** structure encoded this way. If a node has an IPv4 address, then the implementation may allow applications to communicate using that address via an AF_INET6 socket. In such a case, the address will be represented at the API by the corresponding IPv4-mapped IPv6 address. Also, the implementation may allow an AF_INET6 socket bound to **in6addr_any** to receive inbound connections and packets destined to one of the node's IPv4 addresses.

An application may use AF_INET6 sockets to bind to a node's IPv4 address by specifying the address as an IPv4-mapped IPv6 address in a **sockaddr_in6** structure in the *bind*( ) function. For an AF_INET6 socket bound to a node's IPv4 address, the system returns the address in the *getsockname*( ) function as an IPv4-mapped IPv6 address in a **sockaddr_in6** structure.

2.10.19.3 Interface Identification

Each local interface is assigned a unique positive integer as a numeric index. Indexes start at 1; zero is not used. There may be gaps so that there is no current interface for a particular positive index. Each interface also has a unique implementation-defined name.

2.10.19.4 Options

The following options apply at the IPPROTO_IPV6 level:

IPV6_JOIN_GROUP
: When set via *setsockopt*( ), it joins the application to a multicast group on an interface (identified by its index) and addressed by a given multicast address, enabling packets sent to that address to be read via the socket. If the interface index is specified as zero, the system selects the interface (for example, by looking up the address in a routing table and using the resulting interface).

  An attempt to read this option using *getsockopt*( ) results in an [EOPNOTSUPP] error.

  The value of this option is an **ipv6_mreq** structure.

IPV6_LEAVE_GROUP
: When set via *setsockopt*( ), it removes the application from the multicast group on an interface (identified by its index) and addressed by a given multicast address.

  An attempt to read this option using *getsockopt*( ) results in an [EOPNOTSUPP] error.

2976 The value of this option is an **ipv6_mreq** structure.

2977 IPV6_MULTICAST_HOPS
2978 The value of this option is the hop limit for outgoing multicast IPv6 packets sent via the
2979 socket. Its possible values are the same as those of IPV6_UNICAST_HOPS. If the
2980 IPV6_MULTICAST_HOPS option is not set, a value of 1 is assumed. This option can be set
2981 via *setsockopt*( ) and read via *getsockopt*( ).

2982 IPV6_MULTICAST_IF
2983 The index of the interface to be used for outgoing multicast packets. It can be set via
2984 *setsockopt*( ) and read via *getsockopt*( ).

2985 IPV6_MULTICAST_LOOP
2986 This option controls whether outgoing multicast packets should be delivered back to the
2987 local application when the sending interface is itself a member of the destination multicast
2988 group. If it is set to 1 they are delivered. If it is set to 0 they are not. Other values result in an
2989 [EINVAL] error. This option can be set via *setsockopt*( ) and read via *getsockopt*( ).

2990 IPV6_UNICAST_HOPS
2991 The value of this option is the hop limit for outgoing unicast IPv6 packets sent via the
2992 socket. If the option is not set, or is set to –1, the system selects a default value. Attempts to
2993 set a value less than –1 or greater than 255 result in an [EINVAL] error. This option can be
2994 set via *setsockopt*( ) and read via *getsockopt*( ).

2995 An [EOPNOTSUPP] error results if IPV6_JOIN_GROUP or IPV6_LEAVE_GROUP is used with
2996 *getsockopt*( ).

2997 *2.10.19.5 Headers*

2998 Symbolic constant AF_INET6 is defined in the **<sys/socket.h>** header to identify the IPv6 |
2999 Internet address family. See the Base Definitions volume of IEEE Std. 1003.1-200x, Chapter 13, |
3000 Headers. |

3001 The **sockaddr_storage** structure defined in **<sys/socket.h>** is large enough to accommodate a
3002 **sockaddr_in6** structure (see the **<netinet/in.h>** header defined in the Base Definitions volume of |
3003 IEEE Std. 1003.1-200x, Chapter 13, Headers) and is aligned at an appropriate boundary so that |
3004 pointers to it can be cast as pointers to **sockaddr_in6** structures and used to access the fields of
3005 those structures without alignment problems. When a **sockaddr_storage** structure is cast as a
3006 **sockaddr_in6** structure, the *ss_family* field maps onto the *sin6_family* field.

3007 The **<netinet/in.h>**, **<arpa/inet.h>**, and **<netdb.h>** headers contain other definitions used in
3008 connection with IPv6 Internet sockets; see the Base Definitions volume of IEEE Std. 1003.1-200x, |
3009 Chapter 13, Headers. |

2.11 Tracing

TRC This section describes extensions to support tracing of user applications. This functionality is dependent on support of the Trace option (and the rest of this section is not further shaded for this option).

The tracing facilities defined in IEEE Std. 1003.1-200x allow a process to select a set of trace event types, to activate a trace stream of the selected trace events as they occur in the flow of execution, and to retrieve the recorded trace events.

The tracing operation relies on three logically different components: the traced process, the controller process, and the analyzer process. During the execution of the traced process, when a trace point is reached, a trace event is recorded into the trace streams created for that process in which the associated trace event type identifier is not being filtered out. The controller process controls the operation of recording the trace events into the trace stream. It shall be able to:

- Initialize the attributes of a trace stream
- Create the trace stream (for a specified traced process) using those attributes
- Start and stop tracing for the trace stream
- Filter the type of trace events to be recorded, if the Trace Event Filter option is supported
- Shut a trace stream down

These operations can be done for an active trace stream. The analyzer process retrieves the traced events either at runtime, when the trace stream has not yet been shut down, but is still recording trace events; or after opening a trace log that had been previously recorded and shut down. These three logically different operations can be performed by the same process, or can be distributed into different processes.

A trace stream identifier can be created by a call to *posix_trace_create*( ), *posix_trace_create_withlog*( ), or *posix_trace_open*( ). The *posix_trace_create*( ) and *posix_trace_create_withlog*( ) functions should be used by a controller process. The *posix_trace_open*( ) should be used by an analyzer process.

The tracing functions can serve different purposes. One purpose is debugging the possibly pre-instrumented code, while another is post-mortem fault analysis. These two potential uses differ in that the first requires pre-filtering capabilities to avoid overwhelming the trace stream and permits focusing on expected information; while the second needs comprehensive trace capabilities in order to be able to record all types of information.

The events to be traced belong to two classes:

1. User trace events (generated by the application instrumentation)
2. System trace events (generated by the operating system)

The trace interface defines several system trace event types associated with control of and operation of the trace stream. This small set of system trace events includes the minimum required to interpret correctly the trace event information present in the stream. Other desirable system trace events for some particular application profile may be implemented and are encouraged; for example, process and thread scheduling, signal occurrence, and so on.

Each traced process shall have a mapping of the trace event names to trace event type identifiers that have been defined for that process. Each active trace stream shall have a mapping that incorporates all the trace event type identifiers predefined by the trace system plus all the mappings of trace event names to trace event type identifiers of the processes that are being traced into that trace stream. These mappings are defined from the instrumented application by

calling the *posix_trace_eventid_open*( ) function and from the controller process by calling the *posix_trace_trid_eventid_open*( ) function. For a pre-recorded trace stream, the list of trace event types is obtained from the pre-recorded trace log.

The *st_ctime* and *st_mtime* fields of a file associated with an active trace stream shall be marked for update every time any of the tracing operations modifies that file.

The *st_atime* field of a file associated with a trace stream shall be marked for update every time any of the tracing operations causes data to be read from that file.

Results are undefined if the application performs any operation on a file descriptor associated with an active or pre-recorded trace stream until *posix_trace_shutdown*( ) or *posix_trace_close*( ) is called for that trace stream.

The main purpose of this option is to define a complete set of functions and concepts that allow a portable application to be traced from birth to death, whatever its realtime constraints and properties.

2.11.1 Tracing Data Definitions

2.11.1.1 Structures

The **<trace.h>** header shall define the *posix_trace_status_info* and *posix_trace_event_info* structures described below. Implementations may add extensions to these structures.

posix_trace_status_info Structure

To facilitate control of a trace stream, information about the current state of an active trace stream can be obtained dynamically. This structure is returned by a call to the *posix_trace_get_status*( ) function.

The **posix_trace_status_info** structure defined in **<trace.h>** shall contain at least the following members:

Member Type	Member Name	Description
int	*posix_stream_status*	The operating mode of the trace stream.
int	*posix_stream_full_status*	The full status of the trace stream.
int	*posix_stream_overrun_status*	Indicates whether trace events were lost in the trace stream.

If the Trace Log option is supported in addition to the Trace option, the **posix_trace_status_info** structure defined in **<trace.h>** shall contain at least the following additional members:

Member Type	Member Name	Description
int	*posix_stream_flush_status*	Indicates whether a flush is in progress.
int	*posix_stream_flush_error*	Indicates whether any error occurred during the last flush operation.
int	*posix_log_overrun_status*	Indicates whether trace events were lost in the trace log.
int	*posix_log_full_status*	The full status of the trace log.

The *posix_stream_status* member indicates the operating mode of the trace stream and shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_RUNNING
Tracing is in progress; that is, the trace stream is accepting trace events.

POSIX_TRACE_SUSPENDED
The trace stream is not accepting trace events. The tracing operation has not yet started or has stopped, either following a *posix_trace_stop*( ) function call or because the trace resources are exhausted.

The *posix_stream_full_status* member indicates the full status of the trace stream, and it shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_FULL
The space in the trace stream for trace events is exhausted.

POSIX_TRACE_NOT_FULL
There is still space available in the trace stream.

The combination of the *posix_stream_status* and *posix_stream_full_status* members also indicates the actual status of the stream. The status shall be interpreted as follows:

POSIX_TRACE_RUNNING and POSIX_TRACE_NOT_FULL
This status combination indicates that tracing is in progress, and there is space available for recording more trace events.

POSIX_TRACE_RUNNING and POSIX_TRACE_FULL
This status combination indicates that tracing is in progress and that the trace stream is full of trace events. This status combination cannot occur unless the *stream-full-policy* is set to POSIX_TRACE_LOOP. The trace stream contains trace events recorded during a moving time window of prior trace events, and some older trace events may have been overwritten and thus lost.

POSIX_TRACE_SUSPENDED and POSIX_TRACE_NOT_FULL
This status combination indicates that tracing has not yet been started, has been stopped by the *posix_trace_stop*( ) function, or has been cleared by the *posix_trace_clear*( ) function.

POSIX_TRACE_SUSPENDED and POSIX_TRACE_FULL
This status combination indicates that tracing has been stopped by the implementation because the *stream-full-policy* attribute was POSIX_TRACE_UNTIL_FULL and trace resources were exhausted, or that the trace stream was stopped by the function *posix_trace_stop*( ) at a time when trace resources were exhausted.

The *posix_stream_overrun_status* member indicates whether trace events were lost in the trace stream, and shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_OVERRUN
At least one trace event was lost and thus was not recorded in the trace stream.

POSIX_TRACE_NO_OVERRUN
No trace events were lost.

When the corresponding trace stream is created, the *posix_stream_overrun_status* member shall be set to POSIX_TRACE_NO_OVERRUN.

Whenever an overrun occurs, *posix_stream_overrun_status* member shall be set to POSIX_TRACE_OVERRUN.

An overrun occurs when:

- The policy is POSIX_TRACE_LOOP and a recorded trace event is overwritten.
- The policy is POSIX_TRACE_UNTIL_FULL and the trace stream is full when a trace event is generated.
- If the Trace Log option is supported, the policy is POSIX_TRACE_FLUSH and at least one trace event is lost while flushing the trace stream to the trace log.

The *posix_stream_overrun_status* member is reset to zero after its value is read.

If the Trace Log option is supported in addition to the Trace option, the *posix_stream_flush_status*, *posix_stream_flush_error*, *posix_log_overrun_status*, and *posix_log_full_status* members are defined as follows; otherwise, they are undefined.

The *posix_stream_flush_status* member indicates whether a flush operation is being performed and shall have one of the following values defined by manifest constants in the header **<trace.h>**:

POSIX_TRACE_FLUSHING
: The trace stream is currently being flushed to the trace log.

POSIX_TRACE_NOT_FLUSHING
: No flush operation is in progress.

The *posix_stream_flush_status* member shall be set to POSIX_TRACE_FLUSHING if a flush operation is in progress either due to a call to the *posix_trace_flush*( ) function (explicit or caused by a trace stream shutdown operation) or because the trace stream has become full with the *stream-full-policy* attribute set to POSIX_TRACE_FLUSH. The *posix_stream_flush_status* member shall be set to POSIX_TRACE_NOT_FLUSHING if no flush operation is in progress.

The *posix_stream_flush_error* member shall be set to zero if no error occurred during flushing. If an error occurred during a previous flushing operation, the *posix_stream_flush_error* member shall be set to the value of the first error that occurred. If more than one error occurs while flushing, error values after the first shall be discarded. The *posix_stream_flush_error* member is reset to zero after its value is read.

The *posix_log_overrun_status* member indicates whether trace events were lost in the trace log, and shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_OVERRUN
: At least one trace event was lost.

POSIX_TRACE_NO_OVERRUN
: No trace events were lost.

When the corresponding trace stream is created, the *posix_log_overrun_status* member shall be set to POSIX_TRACE_NO_OVERRUN. Whenever an overrun occurs, this status shall be set to POSIX_TRACE_OVERRUN. The *posix_log_overrun_status* member is reset to zero after its value is read.

The *posix_log_full_status* member indicates the full status of the trace log, and it shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_FULL
: The space in the trace log is exhausted.

POSIX_TRACE_NOT_FULL
: There is still space available in the trace log.

The *posix_log_full_status* member is only meaningful if the *log-full-policy* attribute is either POSIX_TRACE_UNTIL_FULL or POSIX_TRACE_LOOP.

For an active trace stream without log, that is created by the *posix_trace_create*( ) function, the *posix_log_overrun_status* member shall be set to POSIX_TRACE_NO_OVERRUN and the *posix_log_full_status* member shall be set to POSIX_TRACE_NOT_FULL.

posix_trace_event_info Structure

The trace event structure **posix_trace_event_info** contains the information for one recorded trace event. This structure is returned by the set of functions *posix_trace_getnext_event*( ), *posix_trace_timedgetnext_event*( ), and *posix_trace_trygetnext_event*( ).

The **posix_trace_event_info** structure defined in **<trace.h>** shall contain at least the following members:

Member Type	Member Name	Description
trace_event_id_t	*posix_event_id*	Trace event type identification.
pid_t	*posix_pid*	Process ID of the process that generated the trace event.
void *	*posix_prog_address*	Address at which the trace point was invoked.
int	*posix_truncation_status*	Status about the truncation of the data associated with this trace event.
struct timespec	*posix_timestamp*	Time at which the trace event was generated.

In addition, if the Trace option and the Threads option are both supported, the **posix_trace_event_info** structure defined in **<trace.h>** shall contain the following additional member:

Member Type	Member Name	Description
pthread_t	*posix_thread_id*	Thread ID of the thread that generated the trace event.

The *posix_event_id* member represents the identification of the trace event type and its value is not directly defined by the user. This identification is returned by a call to one of the following functions: *posix_trace_trid_eventid_open*( ), *posix_trace_eventtypelist_getnext_id*( ), or *posix_trace_eventid_open*( ). The name of the trace event type can be obtained by calling *posix_trace_eventid_get_name*( ).

The *posix_pid* is the process identifier of the traced process which generated the trace event. If the *posix_event_id* member is one of the implementation-defined system trace events and that trace event is not associated with any process, the *posix_pid* member shall be set to zero.

For a user trace event, the *posix_prog_address* member is the process mapped address of the point at which the associated call to the *posix_trace_event*( ) function was made. For a system trace event, if the trace event is caused by a system service explicitly called by the application, the *posix_prog_address* member shall be the address of the process at the point where the call to that system service was made.

The *posix_truncation_status* member defines whether the data associated with a trace event has been truncated at the time the trace event was generated, or at the time the trace event was read from the trace stream, or (if the Trace Log option is supported) from the trace log (see the *event* argument from the *posix_trace_getnext_event*( ) function). The *posix_truncation_status* member

shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_NOT_TRUNCATED
: All the traced data is available.

POSIX_TRACE_TRUNCATED_RECORD
: Data was truncated at the time the trace event was generated.

POSIX_TRACE_TRUNCATED_READ
: Data was truncated at the time the trace event was read from a trace stream or a trace log because the reader's buffer was too small. This truncation status overrides the POSIX_TRACE_TRUNCATED_RECORD status.

The *posix_timestamp* member shall be the time at which the trace event was generated. The clock used is implementation-defined, but the resolution of this clock can be retrieved by a call to the *posix_trace_attr_getclockres*( ) function.

If the Threads option is supported in addition to the Trace option:

- The *posix_thread_id* member is the identifier of the thread that generated the trace event. If the *posix_event_id* member is one of the implementation-defined system trace events and that trace event is not associated with any thread, the *posix_thread_id* member shall be set to zero.

Otherwise, this member is undefined.

2.11.1.2 Trace Stream Attributes

Trace streams have attributes that compose the **posix_trace_attr_t** trace stream attributes object. This object shall contain at least the following attributes:

- The *generation-version* attribute identifies the origin and version of the trace system.
- The *trace-name* attribute is a character string defined by the trace controller, and that identifies the trace stream.
- The *creation-time* attribute represents the time of the creation of the trace stream.
- The *clock-resolution* attribute defines the clock resolution of the clock used to generate timestamps.
- The *stream-min-size* attribute defines the minimum size in bytes of the trace stream strictly reserved for the trace events.
- The *stream-full-policy* attribute defines the policy followed when the trace stream is full; its value is POSIX_TRACE_LOOP, POSIX_TRACE_UNTIL_FULL, or POSIX_TRACE_FLUSH.
- The *max-data-size* attribute defines the maximum record size in bytes of a trace event.

In addition, if the Trace option and the Trace Inherit option are both supported, the **posix_trace_attr_t** trace stream creation attributes object shall contain at least the following attributes:

- The *inheritance* attribute specifies whether a newly created trace stream will inherit tracing in its parent's process trace stream. It is either POSIX_TRACE_INHERITED or POSIX_TRACE_CLOSE_FOR_CHILD.

In addition, if the Trace option and the Trace Log option are both supported, the **posix_trace_attr_t** trace stream creation attributes object shall contain at least the following attribute:

- If the file type corresponding to the trace log supports the POSIX_TRACE_LOOP or the POSIX_TRACE_UNTIL_FULL policies, the *log-max-size* attribute defines the maximum size

in bytes of the trace log associated with an active trace stream. Other stream data—for example, trace attribute values—shall not be included in this size.

- The *log-full-policy* attribute defines the policy of a trace log associated with an active trace stream to be POSIX_TRACE_LOOP, POSIX_TRACE_UNTIL_FULL, or POSIX_TRACE_APPEND.

2.11.2 Trace Event Type Definitions

2.11.2.1 System Trace Event Type Definitions

The following system trace event types, defined in the **<trace.h>** header, track the invocation of the trace operations:

- POSIX_TRACE_START shall be associated with a trace start operation.
- POSIX_TRACE_STOP shall be associated with a trace stop operation.
- if the Trace Event Filter option is supported, POSIX_TRACE_FILTER shall be associated with a trace event type filter change operation.

The following system trace event types, defined in the **<trace.h>** header, report operational trace events:

- POSIX_TRACE_OVERFLOW shall mark the beginning of a trace overflow condition.
- POSIX_TRACE_RESUME shall mark the end of a trace overflow condition.
- If the Trace Log option is supported, POSIX_TRACE_FLUSH_START shall mark the beginning of a flush operation.
- If the Trace Log option is supported, POSIX_TRACE_FLUSH_STOP shall mark the end of a flush operation.
- If an implementation-defined trace error condition is reported, it shall be marked POSIX_TRACE_ERROR.

The interpretation of a trace stream or a trace log by a trace analyzer process relies on the information recorded for each trace event, and also on system trace events that indicate the invocation of trace control operations and trace system operational trace events.

The POSIX_TRACE_START and POSIX_TRACE_STOP trace events specify the time windows during which the trace stream is running.

The POSIX_TRACE_STOP trace event with an associated data that is equal to zero indicates a call of the function *posix_trace_stop*( ).

The POSIX_TRACE_STOP trace event with an associated data that is different from zero indicates an automatic stop of the trace stream (see *posix_trace_attr_getstreamfullpolicy*( ) defined in the System Interfaces volume of IEEE Std. 1003.1-200x).

The POSIX_TRACE_FILTER trace event indicates that a trace event type filter value changed while the trace stream was running.

The POSIX_TRACE_ERROR serves to inform the analyzer process that an implementation-defined internal error of the trace system occurred.

The POSIX_TRACE_OVERFLOW trace event shall be reported with a timestamp equal to the timestamp of the first trace event overwritten. This is an indication that some generated trace events have been lost.

The POSIX_TRACE_RESUME trace event shall be reported with a timestamp equal to the timestamp of the first valid trace event reported after the overflow condition ends and shall be reported before this first valid trace event. This is an indication that the trace system is reliably recording trace events after an overflow condition.

Each of these trace event types is defined by a constant trace event name and a **trace_event_id_t** constant; trace event data is associated with some of these trace events.

If the Trace option is supported and the Trace Event Filter option and the Trace Log option are not supported, the following predefined system trace events in Table 2-6 shall be defined:

Table 2-6 Trace Option: System Trace Events

Event Name	Constant	Associated Data Type
"posix_trace_error"	POSIX_TRACE_ERROR	error int
"posix_trace_start"	POSIX_TRACE_START	None.
"posix_trace_stop"	POSIX_TRACE_STOP	auto int
"posix_trace_overflow"	POSIX_TRACE_OVERFLOW	None.
"posix_trace_resume"	POSIX_TRACE_RESUME	None.

If the Trace option and the Trace Event Filter option are both supported, and if the Trace Log option is not supported, the following predefined system trace events in Table 2-7 shall be defined:

Table 2-7 Trace and Trace Event Filter Options: System Trace Events

Event Name	Constant	Associated Data Type
"posix_trace_error"	POSIX_TRACE_ERROR	error int
"posix_trace_start"	POSIX_TRACE_START	event_filter trace_event_set_t
"posix_trace_stop"	POSIX_TRACE_STOP	auto int
"posix_trace_filter"	POSIX_TRACE_FILTER	old_event_filter new_event_filter trace_event_set_t
"posix_trace_overflow"	POSIX_TRACE_OVERFLOW	None.
"posix_trace_resume"	POSIX_TRACE_RESUME	None.

If the Trace option and the Trace Log option are both supported, and if the Trace Event Filter option is not supported, the following predefined system trace events in Table 2-8 (on page 581) shall be defined:

Table 2-8 Trace and Trace Log Options: System Trace Events

Event Name	Constant	Associated Data Data Type
"posix_trace_error"	POSIX_TRACE_ERROR	error - int
"posix_trace_start"	POSIX_TRACE_START	None.
"posix_trace_stop"	POSIX_TRACE_STOP	auto int
"posix_trace_overflow"	POSIX_TRACE_OVERFLOW	None.
"posix_trace_resume"	POSIX_TRACE_RESUME	None.
"posix_trace_flush_start"	POSIX_TRACE_FLUSH_START	None.
"posix_trace_flush_stop"	POSIX_TRACE_FLUSH_STOP	None.

If the Trace option, the Trace Event Filter option, and the Trace Log option are all supported, the following predefined system trace events in Table 2-9 shall be defined:

Table 2-9 Trace, Trace Log, and Trace Event Filter Options: System Trace Events

Event Name	Constant	Associated Data Data Type
"posix_trace_error"	POSIX_TRACE_ERROR	error int
"posix_trace_start"	POSIX_TRACE_START	event_filter trace_event_set_t
"posix_trace_stop"	POSIX_TRACE_STOP	auto int
"posix_trace_filter"	POSIX_TRACE_FILTER	old_event_filter new_event_filter trace_event_set_t
"posix_trace_overflow"	POSIX_TRACE_OVERFLOW	None.
"posix_trace_resume"	POSIX_TRACE_RESUME	None.
"posix_trace_flush_start"	POSIX_TRACE_FLUSH_START	None.
"posix_trace_flush_stop"	POSIX_TRACE_FLUSH_STOP	None.

2.11.2.2 User Trace Event Type Definitions

The user trace event POSIX_TRACE_UNNAMED_USEREVENT shall be defined in the **<trace.h>** header. If the limit of per-process user trace event names represented by {TRACE_USER_EVENT_MAX} has already been reached, this predefined user event shall be returned when the application tries to register more events than allowed. The data associated with this trace event is application-defined.

The following predefined user trace event in Table 2-10 (on page 582) shall be defined:

Table 2-10 Trace Option: User Trace Event

Event Name	Constant
"posix_trace_unnamed_userevent"	POSIX_TRACE_UNNAMED_USEREVENT

2.11.3 Trace Functions

The trace interface is built and structured to improve portability through use of trace data of opaque type. The object-oriented approach for the manipulation of trace attributes and trace event type identifiers requires definition of many constructor and selector functions which operate on these opaque types. Also, the trace interface must support several different tracing roles. To facilitate reading the trace interface, the trace functions are grouped into small functional sets supporting the three different roles:

- A trace controller process requires functions to set up and customize all the resources needed to run a trace stream, including:
  - — Attribute initialization and destruction (*posix_trace_attr_init*( ))
  - — Identification information manipulation (*posix_trace_attr_getgenversion*( ))
  - — Trace system behavior modification (*posix_trace_attr_getinherited*( ))
  - — Trace stream and trace log size set (*posix_trace_attr_getmaxusereventsize*( ))
  - — Trace stream creation, flush, and shutdown (*posix_trace_create*( ))
  - — Trace stream and trace log clear (*posix_trace_clear*( ))
  - — Trace event type identifier manipulation (*posix_trace_trid_eventid_open*( ))
  - — Trace event type identifier list exploration (*posix_trace_eventtypelist_getnext_id*( ))
  - — Trace event type set manipulation (*posix_trace_eventset_empty*( ))
  - — Trace event type filter set (*posix_trace_set_filter*( ))
  - — Trace stream start and stop (*posix_trace_start*( ))
  - — Trace stream information and status read (*posix_trace_get_attr*( ))
- A traced process requires functions to instrument trace points:
  - — Trace event type identifiers definition and trace points insertion (*posix_trace_event*( ))
- A trace analyzer process requires functions to retrieve information from a trace stream and trace log:
  - — Identification information read (*posix_trace_attr_getgenversion*( ))
  - — Trace system behavior information read (*posix_trace_attr_getinherited*( ))
  - — Trace stream and trace log size get (*posix_trace_attr_getmaxusereventsize*( ))
  - — Trace event type identifier manipulation (*posix_trace_trid_eventid_open*( ))
  - — Trace event type identifier list exploration (*posix_trace_eventtypelist_getnext_id*( ))
  - — Trace log open, rewind, and close (*posix_trace_open*( ))
  - — Trace stream information and status read (*posix_trace_get_attr*( ))
  - — trace event read (*posix_trace_getnext_event*( ))

2.12 Data Types

All of the data types used by various functions are defined by the implementation. The following table describes some of these types. Other types referenced in the description of a function, not mentioned here, can be found in the appropriate header for that function.

Defined Type	Description
cc_t	Type used for terminal special characters.
clock_t	Arithmetic type used for processor times, as defined in the ISO C standard.
clockid_t	Used for clock ID type in some timer functions.
dev_t	Arithmetic type used for device numbers.
DIR	Type representing a directory stream.
div_t	Structure type returned by the *div*( ) function.
FILE	Structure containing information about a file.
glob_t	Structure type used in path name pattern matching.
fpos_t	Type containing all information needed to specify uniquely every position within a file.
gid_t	Arithmetic type used for group IDs.
iconv_t	Type used for conversion descriptors.
id_t	Arithmetic type used as a general identifier; can be used to contain at least the largest of a **pid_t**, **uid_t**, or **gid_t**.
ino_t	Arithmetic type used for file serial numbers.
key_t	Arithmetic type used for XSI interprocess communication.
ldiv_t	Structure type returned by the *ldiv*( ) function.
mode_t	Arithmetic type used for file attributes.
mqd_t	Used for message queue descriptors.
nfds_t	Integer type used for the number of file descriptors.
nlink_t	Arithmetic type used for link counts.
off_t	Signed arithmetic type used for file sizes.
pid_t	Signed arithmetic type used for process and process group IDs.
pthread_attr_t	Used to identify a thread attribute object.
pthread_cond_t	Used for condition variables.
pthread_condattr_t	Used to identify a condition attribute object.
pthread_key_t	Used for thread-specific data keys.
pthread_mutex_t	Used for mutexes.
pthread_mutexattr_t	Used to identify a mutex attribute object.
pthread_once_t	Used for dynamic package initialization.
pthread_rwlock_t	Used for read-write locks.
pthread_rwlockattr_t	Used for read-write lock attributes.
pthread_t	Used to identify a thread.
ptrdiff_t	Signed integer type of the result of subtracting two pointers.
regex_t	Structure type used in regular expression matching.
regmatch_t	Structure type used in regular expression matching.
rlim_t	Unsigned arithmetic type used for limit values, to which objects of type **int** and **off_t** can be cast without loss of value.
sem_t	Type used in performing semaphore operations.
sig_atomic_t	Integer type of an object that can be accessed as an atomic

Defined Type	Description
	entity, even in the presence of asynchronous interrupts.
sigset_t	Integer or structure type of an object used to represent sets of signals.
size_t	Unsigned integer type used for size of objects.
speed_t	Type used for terminal baud rates.
ssize_t	Arithmetic type used for a count of bytes or an error indication.
suseconds_t	Signed arithmetic type used for time in microseconds.
tcflag_t	Type used for terminal modes.
time_t	Arithmetic type used for time in seconds, as defined in the ISO C standard.
timer_t	Used for timer ID returned by the *timer_create*( ) function.
uid_t	Arithmetic type used for user IDs.
useconds_t	Integer type used for time in microseconds.
va_list	Type used for traversing variable argument lists.
wchar_t	Integer type whose range of values can represent distinct codes for all members of the largest extended character set specified by the supported locales.
wctype_t	Scalar type which represents a character class descriptor.
wint_t	Integer type capable of storing any valid value of **wchar_t** or WEOF.
wordexp_t	Structure type used in word expansion.

Chapter 3

System Interfaces

This chapter describes the functions, macros, and external variables to support applications portability at the C-language source level.

NAME

FD_CLR — macros for synchronous I/O multiplexing

SYNOPSIS

```
#include <sys/time.h>

FD_CLR(int fd, fd_set *fdset);
FD_ISSET(int fd, fd_set *fdset);
FD_SET(int fd, fd_set *fdset);
FD_ZERO(fd_set *fdset);
```

DESCRIPTION

Refer to *select*( ).

NAME

_Exit, _exit — terminate a process

SYNOPSIS

```
#include <unistd.h>

void _Exit(int status);
void _exit(int status);
```

DESCRIPTION

Refer to *exit*( ).

NAME

_longjmp, _setjmp — non-local goto

SYNOPSIS

XSI

```
#include <setjmp.h>

void _longjmp(jmp_buf env, int val);
int _setjmp(jmp_buf env);
```

DESCRIPTION

The *_longjmp*( ) and *_setjmp*( ) functions are identical to *longjmp*( ) and *setjmp*( ), respectively, with the additional restriction that *_longjmp*( ) and *_setjmp*( ) do not manipulate the signal mask.

If *_longjmp*( ) is called even though *env* was never initialized by a call to *_setjmp*( ), or when the last such call was in a function that has since returned, the results are undefined.

RETURN VALUE

Refer to *longjmp*( ) and *setjmp*( ).

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

If *_longjmp*( ) is executed and the environment in which *_setjmp*( ) was executed no longer exists, errors can occur. The conditions under which the environment of the *_setjmp*( ) no longer exists include exiting the function that contains the *_setjmp*( ) call, and exiting an inner block with temporary storage. This condition might not be detectable, in which case the *_longjmp*( ) occurs and, if the environment no longer exists, the contents of the temporary storage of an inner block are unpredictable. This condition might also cause unexpected process termination. If the function has returned, the results are undefined.

Passing *longjmp*( ) a pointer to a buffer not created by *setjmp*( ), passing *_longjmp*( ) a pointer to a buffer not created by *_setjmp*( ), passing *siglongjmp*( ) a pointer to a buffer not created by *sigsetjmp*( ), or passing any of these three functions a buffer that has been modified by the user can cause all the problems listed above, and more.

The *_longjmp*( ) and *_setjmp*( ) functions are included to support programs written to historical system interfaces. New applications should use *siglongjmp*( ) and *sigsetjmp*( ) respectively.

RATIONALE

None.

FUTURE DIRECTIONS

The *_longjmp*( ) and *_setjmp*( ) functions may be marked LEGACY in a future version.

3562 Refer to *_longjmp*( ).

NAME

_tolower — transliterate uppercase characters to lowercase

SYNOPSIS

XSI
```
#include <ctype.h>

int _tolower(int c);
```

DESCRIPTION

The *_tolower*( ) macro shall be equivalent to *tolower*(*c*) except that the application shall ensure that the argument *c* is an uppercase letter.

RETURN VALUE

Upon successful completion, *_tolower*( ) shall return the lowercase letter corresponding to the argument passed.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

Issue 6

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

NAME

a64l, l64a — convert between a 32-bit integer and a radix-64 ASCII string

SYNOPSIS

XSI
```
#include <stdlib.h>

long a64l(const char *s);
char *l64a(long value);
```

DESCRIPTION

These functions are used to maintain numbers stored in radix-64 ASCII characters. This is a notation by which 32-bit integers can be represented by up to six characters; each character represents a digit in radix-64 notation. If the type **long** contains more than 32 bits, only the low-order 32 bits shall be used for these operations.

The characters used to represent digits are `'.'` (dot) for 0, `'/'` for 1, `'0'` through `'9'` for 2-11, `'A'` through `'Z'` for 12-37, and `'a'` through `'z'` for 38-63.

The *a64l*( ) function shall take a pointer to a radix-64 representation, in which the first digit is the least significant, and return a corresponding **long** value. If the string pointed to by *s* contains more than six characters, *a64l*( ) shall use the first six. If the first six characters of the string contain a null terminator, *a64l*( ) shall use only characters preceding the null terminator. The *a64l*( ) function scans the character string from left to right with the least significant digit on the left, decoding each character as a 6-bit radix-64 number. If the type **long** contains more than 32 bits, the resulting value is sign-extended. The behavior of *a64l*( ) is unspecified if *s* is a null pointer or the string pointed to by *s* was not generated by a previous call to *l64a*( ).

The *l64a*( ) function shall take a **long** argument and return a pointer to the corresponding radix-64 representation. The behavior of *l64a*( ) is unspecified if *value* is negative.

The value returned by *l64a*( ) may be a pointer into a static buffer. Subsequent calls to *l64a*( ) may overwrite the buffer.

The *l64a*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

Upon successful completion, *a64l*( ) shall return the **long** value resulting from conversion of the input string. If a string pointed to by *s* is an empty string, *a64l*( ) shall return 0L.

The *l64a*( ) function shall return a pointer to the radix-64 representation. If *value* is 0L, *l64a*( ) shall return a pointer to an empty string.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

If the type **long** contains more than 32 bits, the result of *a64l*(*l64a*(*x*)) is *x* in the low-order 32 bits.

RATIONALE

This is not the same encoding as used by either encoding variant of the *uuencode* utility.

FUTURE DIRECTIONS

None.

SEE ALSO

strtoul( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdlib.h>**, the Shell and Utilities volume of IEEE Std. 1003.1-200x, *uuencode*

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Normative text previously in the APPLICATION USAGE section moved to the DESCRIPTION.

A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

NAME

abort — generate an abnormal process abort

SYNOPSIS

```
#include <stdlib.h>

void abort(void);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

The *abort*( ) function shall cause abnormal process termination to occur, unless the signal SIGABRT is being caught and the signal handler does not return.

CX The abnormal termination processing shall include at least the effect of *fclose*( ) on all open streams and the default actions defined for SIGABRT.

XSI On XSI-conformant systems, in addition the abnormal termination processing shall include the effect of *fclose*( ) on message catalog descriptors.

The SIGABRT signal shall be sent to the calling process as if by means of *raise*( ) with the argument SIGABRT.

CX The status made available to *wait*( ) or *waitpid*( ) by *abort*( ) shall be that of a process terminated by the SIGABRT signal. The *abort*( ) function shall override blocking or ignoring the SIGABRT signal.

RETURN VALUE

The *abort*( ) function shall not return.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

Catching the signal is intended to provide the application writer with a portable means to abort processing, free from possible interference from any implementation-defined library functions. If SIGABRT is neither caught nor ignored, then the actions associated with SIGABRT defined in Section 2.4.1 (on page 528) will be taken.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

exit( ), *kill*( ), *raise*( ), *signal*( ), *wait*( ), *waitpid*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdlib.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The following changes are incorporated in this issue for alignment with the ISO C standard and the ISO POSIX-1 standard:

- The argument list is explicitly defined as **void**.
- The DESCRIPTION is revised to identify the correct order in which operations occur. It also identifies:
  - How the calling process is signaled
  - How status information is made available to the host environment
  - That *abort*( ) overrides blocking or ignoring of the SIGABRT signal
- The APPLICATION USAGE section is replaced.

Issue 6

Extensions beyond the ISO C standard are now marked.

NAME

abs — return an integer absolute value

SYNOPSIS

```
#include <stdlib.h>

int abs(int i);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

The *abs*( ) function shall compute the absolute value of its integer operand, *i*. If the result cannot be represented, the behavior is undefined.

RETURN VALUE

The *abs*( ) function shall return the absolute value of its integer operand.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

In two's-complement representation, the absolute value of the negative integer with largest magnitude {INT_MIN} might not be representable.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

fabs( ), *labs*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdlib.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

In the APPLICATION USAGE section, the phrase ''{INT_MIN} is undefined'' is replaced with ''{INT_MIN} might not be representable''.

Issue 6

Extensions beyond the ISO C standard are now marked.

NAME

accept — accept a new connection on a socket

SYNOPSIS

```
#include <sys/socket.h>

int accept(int socket, struct sockaddr *restrict address,
    socklen_t *restrict address_len);
```

DESCRIPTION

The *accept*( ) function shall extract the first connection on the queue of pending connections, create a new socket with the same socket type protocol and address family as the specified socket, and allocate a new file descriptor for that socket.

The *accept*( ) function takes the following arguments:

socket Specifies a socket that was created with *socket*( ), has been bound to an address with *bind*( ), and has issued a successful call to *listen*( ).

address Either a null pointer, or a pointer to a **sockaddr** structure where the address of the connecting socket shall be returned.

address_len Points to a **socklen_t** structure which on input specifies the length of the supplied **sockaddr** structure, and on output specifies the length of the stored address.

If *address* is not a null pointer, the address of the peer for the accepted connection shall be stored in the **sockaddr** structure pointed to by *address*, and the length of this address shall be stored in the object pointed to by *address_len*.

If the actual length of the address is greater than the length of the supplied **sockaddr** structure, the stored address shall be truncated.

If the protocol permits connections by unbound clients, and the peer is not bound, then the value stored in the object pointed to by *address* is unspecified.

If the listen queue is empty of connection requests and O_NONBLOCK is not set on the file descriptor for the socket, *accept*( ) shall block until a connection is present. If the *listen*( ) queue is empty of connection requests and O_NONBLOCK is set on the file descriptor for the socket, *accept*( ) shall fail and set *errno* to [EAGAIN] or [EWOULDBLOCK].

The accepted socket cannot itself accept more connections. The original socket remains open and can accept more connections.

RETURN VALUE

Upon successful completion, *accept*( ) shall return the non-negative file descriptor of the accepted socket. Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *accept*( ) function shall fail if:

[EAGAIN] or [EWOULDBLOCK]
O_NONBLOCK is set for the socket file descriptor and no connections are present to be accepted.

[EBADF] The *socket* argument is not a valid file descriptor.

[ECONNABORTED]
A connection has been aborted.

[EINTR] The *accept*( ) function was interrupted by a signal that was caught before a valid connection arrived.

[EINVAL] The *socket* is not accepting connections.

[EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

[ENFILE] The maximum number of file descriptors in the system are already open.

[ENOTSOCK] The *socket* argument does not refer to a socket.

[EOPNOTSUPP] The socket type of the specified socket does not support accepting connections.

The *accept*( ) function may fail if:

[ENOBUFS] No buffer space is available.

[ENOMEM] There was insufficient memory available to complete the operation. |

XSR [EPROTO] A protocol error has occurred; for example, the STREAMS protocol stack has not been initialized.

EXAMPLES

None.

APPLICATION USAGE

When a connection is available, *select*( ) indicates that the file descriptor for the socket is ready for reading.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

bind( ), *connect*( ), *listen*( ), *socket*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<sys/socket.h>** |

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification. |

The **restrict** keyword is added to the *accept*( ) prototype for alignment with the ISO / IEC 9899: 1999 standard. | |

3833 **NAME**

3834 access — determine accessibility of a file

3835 **SYNOPSIS**

3836 ```
#include <unistd.h>
```

3837 ```
int access(const char *path, int amode);
```

3838 **DESCRIPTION**

3839 The *access*( ) function shall check the file named by the path name pointed to by the *path*
3840 argument for accessibility according to the bit pattern contained in *amode*, using the real user ID
3841 in place of the effective user ID and the real group ID in place of the effective group ID.

3842 The value of *amode* is either the bitwise-inclusive OR of the access permissions to be checked
3843 (R_OK, W_OK, X_OK) or the existence test (F_OK).

3844 If any access permissions are checked, each shall be checked individually, as described in the |
3845 Base Definitions volume of IEEE Std. 1003.1-200x, Chapter 3, Definitions. If the process has |
3846 appropriate privileges, an implementation may indicate success for X_OK even if none of the
3847 execute file permission bits are set.

3848 **RETURN VALUE**

3849 If the requested access is permitted, *access*( ) succeeds and shall return 0; otherwise, –1 shall be
3850 returned and *errno* shall be set to indicate the error.

3851 **ERRORS**

3852 The *access*( ) function shall fail if:

3853 [EACCES] Permission bits of the file mode do not permit the requested access, or search |
3854 permission is denied on a component of the path prefix. |

3855 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path* |
3856 argument. |

3857 [ENAMETOOLONG] |
3858 The length of the *path* argument exceeds {PATH_MAX} or a path name |
3859 component is longer than {NAME_MAX}. |

3860 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string. |

3861 [ENOTDIR] A component of the path prefix is not a directory. |

3862 [EROFS] Write access is requested for a file on a read-only file system. |

3863 The *access*( ) function may fail if:

3864 [EINVAL] The value of the *amode* argument is invalid. |

3865 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
3866 resolution of the *path* argument. |

3867 [ENAMETOOLONG] |
3868 As a result of encountering a symbolic link in resolution of the *path* argument,
3869 the length of the substituted path name string exceeded {PATH_MAX}. |

3870 [ETXTBSY] Write access is requested for a pure procedure (shared text) file that is being |
3871 executed. |

EXAMPLES

Testing for the Existence of a File

The following example tests whether a file named **myfile** exists in the **/tmp** directory.

```
#include <unistd.h>
...
int result;
const char *filename = "/tmp/myfile";

result = access (filename, F_OK);
```

APPLICATION USAGE

Additional values of *amode* other than the set defined in the description may be valid; for example, if a system has extended access controls.

RATIONALE

In early proposals, some inadequacies in the *access*( ) function led to the creation of an *eaccess*( ) function because:

1. Historical implementations of *access*( ) do not test file access correctly when the process' real user ID is superuser. In particular, they always return zero when testing execute permissions without regard to whether the file is executable.
2. The superuser has complete access to all files on a system. As a consequence, programs started by the superuser and switched to the effective user ID with lesser privileges cannot use *access*( ) to test their file access permissions.

However, the historical model of *eaccess*( ) does not resolve problem (1), so this volume of IEEE Std. 1003.1-200x now allows *access*( ) to behave in the desired way because several implementations have corrected the problem. It was also argued that problem (2) is more easily solved by using *open*( ), *chdir*( ), or one of the *exec* functions as appropriate and responding to the error, rather than creating a new function that would not be as reliable. Therefore, *eaccess*( ) is not included in this volume of IEEE Std. 1003.1-200x.

The sentence concerning appropriate privileges and execute permission bits reflects the two possibilities implemented by historical implementations when checking superuser access for X_OK.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The following change is incorporated for alignment with the ISO POSIX-1 standard:

- The type of argument *path* is changed from **char*** to **const char***.

The following change is incorporated for alignment with the FIPS requirements:

- In the ERRORS section, the condition whereby [ENAMETOOLONG] is returned if a path name component is larger that {NAME_MAX} is now defined as mandatory and marked as an extension.

Issue 4, Version 2

The ERRORS section is updated for X/OPEN UNIX conformance as follows:

- It states that [ELOOP] is returned if too many symbolic links are encountered during path name resolution.
- A second [ENAMETOOLONG] condition is defined that may report excessive length of an intermediate result of path name resolution of a symbolic link.

Issue 6

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The [ENAMETOOLONG] error is restored as an error dependent on _POSIX_NO_TRUNC. This is since behavior may vary from one file system to another.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.
- The [ETXTBSY] optional error condition is added.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

NAME

acos, acosf, acosl — arc cosine function

SYNOPSIS

```
#include <math.h>

double acos(double x);
float acosf(float x);
long double acosl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

The *acos* family of functions shall compute the principal value of the arc cosine of *x*. The value of *x* should be in the range [–1,1].

An application wishing to check for error situations should set *errno* to 0 before calling *acos*( ). If *errno* is non-zero on return, or the value NaN is returned, an error has occurred.

RETURN VALUE

Upon successful completion, the *acos* family of functions shall return the arc cosine of *x*, in the XSI range [0,π] radians. If the value of *x* is not in the range [–1,1], and is not ±Inf or NaN, either 0.0 or NaN shall be returned and *errno* shall be set to [EDOM].

XSI If *x* is NaN, NaN shall be returned and *errno* may be set to [EDOM]. If *x* is ±Inf, either 0.0 shall be returned and *errno* shall be set to [EDOM], or NaN shall be returned and *errno* may be set to [EDOM].

ERRORS

The *acos* family of functions shall fail if:

XSI [EDOM] The value *x* is not ±Inf or NaN and is not in the range [–1,1].

The *acos* family of functions may fail if:

XSI [EDOM] The value *x* is ±Inf or NaN.

XSI No other errors shall occur.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

Removed references to *matherr*( ).

The RETURN VALUE and ERRORS sections are substantially rewritten for alignment with the ISO C standard and to rationalize error handling in the mathematics functions.

The return value specified for [EDOM] is marked as an extension.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *acosf*( ) and *acosl*( ) functions are added for alignment with the ISO / IEC 9899: 1999 standard.

NAME

acosh, acoshf, acoshl, asinh, asinfh, asinfl, atanh, atanhf, atanhl — inverse hyperbolic functions

SYNOPSIS

```
#include <math.h>

double acosh(double x);
float acoshf(float x);
long double acoshl(long double x);
double asinh(double x);
float asinhf(float x);
long double asinhl(long double x);
double atanh(double x);
float atanhf(float x);
long double atanhl(long double x);
```

DESCRIPTION

The *acosh*( ), *asinh*( ), and *atanh*( ) functions shall compute the inverse hyperbolic cosine, sine, and tangent of their argument, respectively.

RETURN VALUE

The *acosh*( ), *asinh*( ), and *atanh*( ) functions shall return the inverse hyperbolic cosine, sine, and tangent of their argument, respectively.

The *acosh*( ), *acoshf*( ), and *acoshl*( ) functions shall return an implementation-defined value (NaN or equivalent if available) and set *errno* to [EDOM] when its argument is less than 1.0.

The *atanh*( ), *atanhf*( ), and *atanhl*( ) functions shall return an implementation-defined value (NaN or equivalent if available) and set *errno* to [EDOM] when its argument has absolute value greater than 1.0.

If *x* is NaN, the *asinh*( ), *acosh*( ), and *atanh*( ) functions shall return NaN and may set *errno* to [EDOM].

ERRORS

The *acosh*( ), *acoshf*( ), and *acoshl*( ) functions shall fail if:

[EDOM] The *x* argument is less than 1.0.

The *atanh*( ), *atanhf*( ), and *atanhl*( ) functions shall fail if:

[EDOM] The *x* argument has an absolute value greater than 1.0.

The *atanh*( ), *atanhf*( ), and *atanhl*( ) functions shall fail if:

[ERANGE] The *x* argument has an absolute value equal to 1.0

The *asinh*( ), *acosh*( ), and *atanh*( ) functions may fail if:

[EDOM] The value of *x* is NaN.

NAME

aio_cancel — cancel an asynchronous I/O request (**REALTIME**)

SYNOPSIS

AIO
```
#include <aio.h>

int aio_cancel(int fildes, struct aiocb *aiocbp);
```

DESCRIPTION

The *aio_cancel*( ) function shall attempt to cancel one or more asynchronous I/O requests currently outstanding against file descriptor *fildes*. The *aiocbp* argument points to the asynchronous I/O control block for a particular request to be canceled. If *aiocbp* is NULL, then all outstanding cancelable asynchronous I/O requests against *fildes* shall be canceled.

Normal asynchronous notification shall occur for asynchronous I/O operations that are successfully canceled. If there are requests that cannot be canceled, then the normal asynchronous completion process shall take place for those requests when they are completed.

For requested operations that are successfully canceled, the associated error status shall be set to [ECANCELED] and the return status shall be −1. For requested operations that are not successfully canceled, the *aiocbp* shall not be modified by *aio_cancel*( ).

If *aiocbp* is not NULL, then if *fildes* does not have the same value as the file descriptor with which the asynchronous operation was initiated, unspecified results occur.

Which operations are cancelable is implementation-defined.

RETURN VALUE

The *aio_cancel*( ) function shall return the value AIO_CANCELED to the calling process if the requested operation(s) were canceled. The value AIO_NOTCANCELED shall be returned if at least one of the requested operation(s) cannot be canceled because it is in progress. In this case, the state of the other operations, if any, referenced in the call to *aio_cancel*( ) is not indicated by the return value of *aio_cancel*( ). The application may determine the state of affairs for these operations by using *aio_error*( ). The value AIO_ALLDONE is returned if all of the operations have already completed. Otherwise, the function shall return −1 and set *errno* to indicate the error.

ERRORS

The *aio_cancel*( ) function shall fail if:

[EBADF] The *fildes* argument is not a valid file descriptor.

EXAMPLES

None.

APPLICATION USAGE

The *aio_cancel*( ) function is part of the Asynchronous Input and Output option and need not be available on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

4081 The APPLICATION USAGE section is added.

NAME

aio_error — retrieve errors status for an asynchronous I/O operation (**REALTIME**)

SYNOPSIS

AIO
```
#include <aio.h>

int aio_error(const struct aiocb *aiocbp);
```

DESCRIPTION

The *aio_error*() function shall return the error status associated with the **aiocb** structure referenced by the *aiocbp* argument. The error status for an asynchronous I/O operation is the SIO *errno* value that would be set by the corresponding *read*(), *write*(), *fdatasync*(), or *fsync*() operation. If the operation has not yet completed, then the error status shall be equal to [EINPROGRESS].

RETURN VALUE

If the asynchronous I/O operation has completed successfully, then 0 shall be returned. If the asynchronous operation has completed unsuccessfully, then the error status, as described for SIO *read*(), *write*(), *fdatasync*(), and *fsync*(), shall be returned. If the asynchronous I/O operation has not yet completed, then [EINPROGRESS] shall be returned.

ERRORS

The *aio_error*() function may fail if:

[EINVAL] The *aiocbp* argument does not refer to an asynchronous operation whose return status has not yet been retrieved.

EXAMPLES

None.

APPLICATION USAGE

The *aio_error*() function is part of the Asynchronous Input and Output option and need not be available on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Asynchronous Input and Output option.

The APPLICATION USAGE section is added.

4121 **NAME**

4122 aio_fsync — asynchronous file synchronization (**REALTIME**)

4123 **SYNOPSIS**

4124 AIO
```
#include <aio.h>
```

4125
```
int aio_fsync(int op, struct aiocb *aiocbp);
```

4126

4127 **DESCRIPTION**

4128 The *aio_fsync*( ) function asynchronously forces all I/O operations associated with the file
4129 indicated by the file descriptor *aio_fildes* member of the **aiocb** structure referenced by the *aiocbp*
4130 argument and queued at the time of the call to *aio_fsync*( ) to the synchronized I/O completion
4131 state. The function call shall return when the synchronization request has been initiated or
4132 queued to the file or device (even when the data cannot be synchronized immediately).

4133 If *op* is O_DSYNC, all currently queued I/O operations shall be completed as if by a call to
4134 *fdatasync*( ); that is, as defined for synchronized I/O data integrity completion. If *op* is O_SYNC,
4135 all currently queued I/O operations shall be completed as if by a call to *fsync*( ); that is, as
4136 defined for synchronized I/O file integrity completion. If the *aio_fsync*( ) function fails, or if the
4137 operation queued by *aio_fsync*( ) fails, then, as for *fsync*( ) and *fdatasync*( ), outstanding I/O
4138 operations are not guaranteed to have been completed.

4139 If *aio_fsync*( ) succeeds, then it is only the I/O that was queued at the time of the call to
4140 *aio_fsync*( ) that is guaranteed to be forced to the relevant completion state. The completion of
4141 subsequent I/O on the file descriptor is not guaranteed to be completed in a synchronized
4142 fashion.

4143 The *aiocbp* argument refers to an asynchronous I/O control block. The *aiocbp* value may be used
4144 as an argument to *aio_error*( ) and *aio_return*( ) in order to determine the error status and return
4145 status, respectively, of the asynchronous operation while it is proceeding. When the request is
4146 queued, the error status for the operation is [EINPROGRESS]. When all data has been |
4147 successfully transferred, the error status shall be reset to reflect the success or failure of the
4148 operation. If the operation does not complete successfully, the error status for the operation shall
4149 be set to indicate the error. The *aio_sigevent* member determines the asynchronous notification to
4150 occur as specified in Section 2.4.1 (on page 528) when all operations have achieved synchronized
4151 I/O completion. All other members of the structure referenced by *aiocbp* are ignored. If the
4152 control block referenced by *aiocbp* becomes an illegal address prior to asynchronous I/O
4153 completion, then the behavior is undefined.

4154 If the *aio_fsync*( ) function fails or the *aiocbp* indicates an error condition, data is not guaranteed
4155 to have been successfully transferred.

4156 **RETURN VALUE**

4157 The *aio_fsync*( ) function shall return the value 0 to the calling process if the I/O operation is
4158 successfully queued; otherwise, the function shall return the value –1 and set *errno* to indicate
4159 the error.

4160 **ERRORS**

4161 The *aio_fsync*( ) function shall fail if:

4162 [EAGAIN] The requested asynchronous operation was not queued due to temporary |
4163 resource limitations.

4164 [EBADF] The *aio_fildes* member of the **aiocb** structure referenced by the *aiocbp* argument |
4165 is not a valid file descriptor open for writing.

[EINVAL] This implementation does not support synchronized I/O for this file.

[EINVAL] A value of *op* other than O_DSYNC or O_SYNC was specified.

In the event that any of the queued I/O operations fail, *aio_fsync*() shall return the error condition defined for *read*() and *write*(). The error is returned in the error status for the asynchronous *fsync*() operation, which can be retrieved using *aio_error*().

EXAMPLES

None.

APPLICATION USAGE

The *aio_fsync*() function is part of the Asynchronous Input and Output option and need not be available on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Asynchronous Input and Output option.

The APPLICATION USAGE section is added.

4189 **NAME**

4190 aio_read — asynchronous read from a file (**REALTIME**)

4191 **SYNOPSIS**

4192 AIO
```
#include <aio.h>
```

4193
```
int aio_read(struct aiocb *aiocbp);
```

4194

4195 **DESCRIPTION**

4196 The *aio_read*( ) function allows the calling process to read *aiocbp->aio_nbytes* from the file
4197 associated with *aiocbp->aio_fildes* into the buffer pointed to by *aiocbp->aio_buf*. The function call
4198 shall return when the read request has been initiated or queued to the file or device (even when
4199 the data cannot be delivered immediately).

4200 PIO If prioritized I/O is supported for this file, then the asynchronous operation is submitted at a
4201 priority equal to the scheduling priority of the process minus *aiocbp->aio_reqprio*.

4202 The *aiocbp* value may be used as an argument to *aio_error*( ) and *aio_return*( ) in order to
4203 determine the error status and return status, respectively, of the asynchronous operation while it
4204 is proceeding. If an error condition is encountered during queuing, the function call shall return
4205 without having initiated or queued the request. The requested operation takes place at the
4206 absolute position in the file as given by *aio_offset*, as if *lseek*( ) were called immediately prior to
4207 the operation with an *offset* equal to *aio_offset* and a *whence* equal to {SEEK_SET}. After a
4208 successful call to enqueue an asynchronous I/O operation, the value of the file offset for the file
4209 is unspecified.

4210 The *aiocbp->aio_lio_opcode* field shall be ignored by *aio_read*( ).

4211 The *aiocbp* argument points to an **aiocb** structure. If the buffer pointed to by *aiocbp->aio_buf* or
4212 the control block pointed to by *aiocbp* becomes an illegal address prior to asynchronous I/O
4213 completion, then the behavior is undefined.

4214 Simultaneous asynchronous operations using the same *aiocbp* produce undefined results.

4215 SIO If synchronized I/O is enabled on the file associated with *aiocbp->aio_fildes*, the behavior of this
4216 function shall be according to the definitions of synchronized I/O data integrity completion and
4217 synchronized I/O file integrity completion.

4218 For any system action that changes the process memory space while an asynchronous I/O is
4219 outstanding to the address range being changed, the result of that action is undefined.

4220 For regular files, no data transfer shall occur past the offset maximum established in the open
4221 file description associated with *aiocbp->aio_fildes*.

4222 **RETURN VALUE**

4223 The *aio_read*( ) function shall return the value zero to the calling process if the I/O operation is
4224 successfully queued; otherwise, the function shall return the value –1 and set *errno* to indicate
4225 the error.

4226 **ERRORS**

4227 The *aio_read*( ) function shall fail if:

4228 [EAGAIN] The requested asynchronous I/O operation was not queued due to system
4229 resource limitations.

4230 Each of the following conditions may be detected synchronously at the time of the call to
4231 *aio_read*( ), or asynchronously. If any of the conditions below are detected synchronously, the
4232 *aio_read*( ) function shall return –1 and set *errno* to the corresponding value. If any of the
4233 conditions below are detected asynchronously, the return status of the asynchronous operation

is set to –1, and the error status of the asynchronous operation is set to the corresponding value.

[EBADF] The *aiocbp->aio_fildes* argument is not a valid file descriptor open for reading.

[EINVAL] The file offset value implied by *aiocbp->aio_offset* would be invalid, *aiocbp->aio_reqprio* is not a valid value, or *aiocbp->aio_nbytes* is an invalid value.

In the case that the *aio_read*( ) successfully queues the I/O operation but the operation is subsequently canceled or encounters an error, the return status of the asynchronous operation is one of the values normally returned by the *read*( ) function call. In addition, the error status of the asynchronous operation is set to one of the error statuses normally set by the *read*( ) function call, or one of the following values:

[EBADF] The *aiocbp->aio_fildes* argument is not a valid file descriptor open for reading.

[ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit *aio_cancel*( ) request.

[EINVAL] The file offset value implied by *aiocbp->aio_offset* would be invalid.

The following condition may be detected synchronously or asynchronously:

[EOVERFLOW] The file is a regular file, *aiobcp->aio_nbytes* is greater than 0, and the starting offset in *aiobcp->aio_offset* is before the end-of-file and is at or beyond the offset maximum in the open file description associated with *aiocbp->aio_fildes*.

EXAMPLES

None.

APPLICATION USAGE

The *aio_read*( ) function is part of the Asynchronous Input and Output option and need not be available on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Large File Summit extensions are added.

Issue 6

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Asynchronous Input and Output option.

The APPLICATION USAGE section is added.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file description. This change is to support large files.
- In the ERRORS section, the [EOVERFLOW] condition is added. This change is to support large files.

NAME

aio_return — retrieve return status of an asynchronous I/O operation (**REALTIME**)

SYNOPSIS

AIO

```
#include <aio.h>

ssize_t aio_return(struct aiocb *aiocbp);
```

DESCRIPTION

The *aio_return*( ) function shall return the return status associated with the **aiocb** structure referenced by the *aiocbp* argument. The return status for an asynchronous I/O operation is the value that would be returned by the corresponding *read*( ), *write*( ), or *fsync*( ) function call. If the error status for the operation is equal to [EINPROGRESS], then the return status for the operation is undefined. The *aio_return*( ) function may be called exactly once to retrieve the return status of a given asynchronous operation; thereafter, if the same **aiocb** structure is used in a call to *aio_return*( ) or *aio_error*( ), an error may be returned. When the **aiocb** structure referred to by *aiocbp* is used to submit another asynchronous operation, then *aio_return*( ) may be successfully used to retrieve the return status of that operation.

RETURN VALUE

If the asynchronous I/O operation has completed, then the return status, as described for *read*( ), *write*( ), and *fsync*( ), shall be returned. If the asynchronous I/O operation has not yet completed, the results of *aio_return*( ) are undefined.

ERRORS

The *aio_return*( ) function may fail if:

[EINVAL] The *aiocbp* argument does not refer to an asynchronous operation whose return status has not yet been retrieved.

EXAMPLES

None.

APPLICATION USAGE

The *aio_return*( ) function is part of the Asynchronous Input and Output option and need not be available on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

aio_cancel( ), *aio_error*( ), *aio_fsync*( ), *aio_read*( ), *aio_write*( ), *close*( ), *exec*, *exit*( ), *fork*( ), *lio_listio*( ), *lseek*( ), *read*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<aio.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Asynchronous Input and Output option.

The APPLICATION USAGE section is added.

The [EINVAL] error condition is updated as a ‘‘may fail’’. This is for consistency with the DESCRIPTION.

NAME

aio_suspend — wait for an asynchronous I/O request (**REALTIME**)

SYNOPSIS

AIO
```
#include <aio.h>

int aio_suspend(const struct aiocb * const list[], int nent,
    const struct timespec *timeout);
```

DESCRIPTION

The *aio_suspend*( ) function shall suspend the calling thread until at least one of the asynchronous I/O operations referenced by the *list* argument has completed, until a signal interrupts the function, or, if *timeout* is not NULL, until the time interval specified by *timeout* has passed. If any of the **aiocb** structures in the list correspond to completed asynchronous I/O operations (that is, the error status for the operation is not equal to [EINPROGRESS]) at the time of the call, the function shall return without suspending the calling thread. The *list* argument is an array of pointers to asynchronous I/O control blocks. The *nent* argument indicates the number of elements in the array. Each **aiocb** structure pointed to has been used in initiating an asynchronous I/O request via *aio_read*( ), *aio_write*( ), or *lio_listio*( ). This array may contain NULL pointers, which are ignored. If this array contains pointers that refer to **aiocb** structures that have not been used in submitting asynchronous I/O, the effect is undefined.

If the time interval indicated in the **timespec** structure pointed to by *timeout* passes before any of the I/O operations referenced by *list* are completed, then *aio_suspend*( ) shall return with an error. MON If the Monotonic Clock option is supported, the clock that shall be used to measure this time interval shall be the CLOCK_MONOTONIC clock.

RETURN VALUE

If the *aio_suspend*( ) function returns after one or more asynchronous I/O operations have completed, the function shall return zero. Otherwise, the function shall return a value of –1 and set *errno* to indicate the error.

The application may determine which asynchronous I/O completed by scanning the associated error and return status using *aio_error*( ) and *aio_return*( ), respectively.

ERRORS

The *aio_suspend*( ) function shall fail if:

[EAGAIN] No asynchronous I/O indicated in the list referenced by *list* completed in the time interval indicated by *timeout*.

[EINTR] A signal interrupted the *aio_suspend*( ) function. Note that, since each asynchronous I/O operation may possibly provoke a signal when it completes, this error return may be caused by the completion of one (or more) of the very I/O operations being awaited.

EXAMPLES

None.

APPLICATION USAGE

The *aio_suspend*( ) function is part of the Asynchronous Input and Output option and need not be available on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

aio_read( ), *aio_write*( ), *lio_listio*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<aio.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Asynchronous Input and Output option.

The APPLICATION USAGE section is added.

The DESCRIPTION is updated for alignment with IEEE Std. 1003.1j-2000 by specifying that the CLOCK_MONOTONIC clock, if supported, is used.

4376 **NAME**

4377 aio_write — asynchronous write to a file (**REALTIME**)

4378 **SYNOPSIS**

4379 AIO
```
#include <aio.h>
```

4380
```
int aio_write(struct aiocb *aiocbp);
```

4381

4382 **DESCRIPTION**

4383 The *aio_write*( ) function allows the calling process to write *aiocbp->aio_nbytes* to the file |
4384 associated with *aiocbp->aio_fildes* from the buffer pointed to by *aiocbp->aio_buf*. The function call |
4385 shall return when the write request has been initiated or, at a minimum, queued to the file or |
4386 device.

4387 PIO If prioritized I/O is supported for this file, then the asynchronous operation shall be submitted
4388 at a priority equal to the scheduling priority of the process minus *aiocbp->aio_reqprio*. |

4389 The *aiocbp* may be used as an argument to *aio_error*( ) and *aio_return*( ) in order to determine the
4390 error status and return status, respectively, of the asynchronous operation while it is proceeding.

4391 The *aiocbp* argument points to an **aiocb** structure. If the buffer pointed to by *aiocbp->aio_buf* or |
4392 the control block pointed to by *aiocbp* becomes an illegal address prior to asynchronous I/O
4393 completion, then the behavior is undefined.

4394 If O_APPEND is not set for the file descriptor *aio_fildes*, then the requested operation takes place
4395 at the absolute position in the file as given by *aio_offset*, as if *lseek*( ) were called immediately
4396 prior to the operation with an *offset* equal to *aio_offset* and a *whence* equal to {SEEK_SET}. If
4397 O_APPEND is set for the file descriptor, write operations append to the file in the same order as
4398 the calls were made. After a successful call to enqueue an asynchronous I/O operation, the value
4399 of the file offset for the file is unspecified.

4400 The *aiocbp->aio_lio_opcode* field shall be ignored by *aio_write*( ). |

4401 Simultaneous asynchronous operations using the same *aiocbp* produce undefined results.

4402 SIO If synchronized I/O is enabled on the file associated with *aiocbp->aio_fildes*, the behavior of this |
4403 function shall be according to the definitions of synchronized I/O data integrity completion, and |
4404 synchronized I/O file integrity completion.

4405 For any system action that changes the process memory space while an asynchronous I/O is
4406 outstanding to the address range being changed, the result of that action is undefined.

4407 For regular files, no data transfer shall occur past the offset maximum established in the open |
4408 file description associated with *aiocbp->aio_fildes*. |

4409 **RETURN VALUE**

4410 The *aio_write*( ) function shall return the value zero to the calling process if the I/O operation is
4411 successfully queued; otherwise, the function shall return the value –1 and set *errno* to indicate
4412 the error.

4413 **ERRORS**

4414 The *aio_write*( ) function shall fail if:

4415 [EAGAIN] The requested asynchronous I/O operation was not queued due to system |
4416 resource limitations.

4417 Each of the following conditions may be detected synchronously at the time of the call to
4418 *aio_write*( ), or asynchronously. If any of the conditions below are detected synchronously, the
4419 *aio_write*( ) function shall return –1 and set *errno* to the corresponding value. If any of the

conditions below are detected asynchronously, the return status of the asynchronous operation shall be set to –1, and the error status of the asynchronous operation is set to the corresponding value.

[EBADF] The *aiocbp->aio_fildes* argument is not a valid file descriptor open for writing.

[EINVAL] The file offset value implied by *aiocbp->aio_offset* would be invalid, *aiocbp->aio_reqprio* is not a valid value, or *aiocbp->aio_nbytes* is an invalid value.

In the case that the *aio_write*( ) successfully queues the I/O operation, the return status of the asynchronous operation shall be one of the values normally returned by the *write*( ) function call. If the operation is successfully queued but is subsequently canceled or encounters an error, the error status for the asynchronous operation contains one of the values normally set by the *write*( ) function call, or one of the following:

[EBADF] The *aiocbp->aio_fildes* argument is not a valid file descriptor open for writing.

[EINVAL] The file offset value implied by *aiocbp->aio_offset* would be invalid.

[ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit *aio_cancel*( ) request.

The following condition may be detected synchronously or asynchronously:

[EFBIG] The file is a regular file, *aiobcp->aio_nbytes* is greater than 0, and the starting offset in *aiobcp->aio_offset* is at or beyond the offset maximum in the open file description associated with *aiocbp->aio_fildes*.

EXAMPLES

None.

APPLICATION USAGE

The *aio_write*( ) function is part of the Asynchronous Input and Output option and need not be available on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

aio_cancel( ), *aio_error*( ), *aio_read*( ), *aio_return*( ), *close*( ), *exec*, *exit*( ), *fork*( ), *lio_listio*( ), *lseek*( ), *write*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<aio.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Large File Summit extensions are added.

Issue 6

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Asynchronous Input and Output option.

The APPLICATION USAGE section is added.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, text is added to indicate that for regular files no data transfer occurs past the offset maximum established in the open file description associated with *aiocbp->aio_fildes*.

4463 • The [EFBIG] error is added as part of the large file support extensions.

4464 **NAME**

4465 alarm — schedule an alarm signal

4466 **SYNOPSIS**

4467 `#include <unistd.h>`

4468 `unsigned alarm(unsigned seconds);`

4469 **DESCRIPTION**

4470 The *alarm*( ) function shall cause the system to generate a SIGALRM signal for the process after
4471 the number of realtime seconds specified by *seconds* have elapsed. Processor scheduling delays
4472 may prevent the process from handling the signal as soon as it is generated.

4473 If *seconds* is 0, a pending alarm request, if any, is canceled.

4474 Alarm requests are not stacked; only one SIGALRM generation can be scheduled in this manner.
4475 If the SIGALRM signal has not yet been generated, the call shall result in rescheduling the time
4476 at which the SIGALRM signal is generated.

4477 Interactions between *alarm*( ) and any of *setitimer*( ), *ualarm*( ), or *usleep*( ) are unspecified.

4478 **RETURN VALUE**

4479 If there is a previous *alarm*( ) request with time remaining, *alarm*( ) shall return a non-zero value
4480 that is the number of seconds until the previous request would have generated a SIGALRM
4481 signal. Otherwise, *alarm*( ) shall return 0.

4482 **ERRORS**

4483 The *alarm*( ) function is always successful, and no return value is reserved to indicate an error.

4484 **EXAMPLES**

4485 None.

4486 **APPLICATION USAGE**

4487 The *fork*( ) function clears pending alarms in the child process. A new process image created by
4488 one of the *exec* functions inherits the time left to an alarm signal in the old process' image.

4489 Application writers should note that the type of the argument *seconds* and the return value of
4490 *alarm*( ) is **unsigned**. That means that a Strictly Conforming POSIX System Interfaces
4491 Application cannot pass a value greater than the minimum guaranteed value for {UINT_MAX},
4492 which the ISO C standard sets as 65 535, and any application passing a larger value is restricting
4493 its portability. A different type was considered, but historical implementations, including those
4494 with a 16-bit **int** type, consistently use either **unsigned** or **int**.

4495 Application writers should be aware of possible interactions when the same process uses both
4496 the *alarm*( ) and *sleep*( ) functions.

4497 **RATIONALE**

4498 Many historical implementations (including Version 7 and System V) allow an alarm to occur up
4499 to a second early. Other implementations allow alarms up to half a second or one clock tick
4500 early or do not allow them to occur early at all. The latter is considered most appropriate, since it
4501 gives the most predictable behavior, especially since the signal can always be delayed for an
4502 indefinite amount of time due to scheduling. Applications can thus choose the *seconds* argument
4503 as the minimum amount of time they wish to have elapse before the signal.

4504 The term *realtime* here and elsewhere (*sleep*( ), *times*( )) is intended to mean ''wall clock'' time as
4505 common English usage, and has nothing to do with ''realtime operating systems''. It is in
4506 contrast to *virtual time,* which could be misinterpreted if just *time* were used.

4507 In some implementations, including 4.3 BSD, very large values of the *seconds* argument are
4508 silently rounded down to an implementation-defined maximum value. This maximum is large

enough (on the order of several months) that the effect is not noticeable.

There were two possible choices for alarm generation in multi-threaded applications: generation for the calling thread or generation for the process. The first option would not have been particularly useful since the alarm state is maintained on a per-process basis and the alarm that is established by the last invocation of *alarm*( ) is the only one that would be active.

Furthermore, allowing generation of an asynchronous signal for a thread would have introduced an exception to the overall signal model. This requires a compelling reason in order to be justified.

FUTURE DIRECTIONS

None.

SEE ALSO

alarm( ), *exec*, *fork*( ), *getitimer*( ), *pause*( ), *sigaction*( ), *sleep*( ), *ualarm*( ), *usleep*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<signal.h>**, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The **<unistd.h>** header is included in the SYNOPSIS section.

Issue 4, Version 2

The DESCRIPTION is updated to indicate that interactions with the *setitimer*( ), *ualarm*( ), and *usleep*( ) functions are unspecified.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to indicate that interactions with the *setitimer*( ), *ualarm*( ), and *usleep*( ) functions are unspecified.

NAME

asctime, asctime_r — convert date and time to a string

SYNOPSIS

```
#include <time.h>

char *asctime(const struct tm *timeptr);
```

TSF
```
char *asctime_r(const struct tm *restrict tm, char *restrict buf);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

The *asctime*( ) function shall convert the broken-down time in the structure pointed to by *timeptr* into a string in the form:

```
Sun Sep 16 01:03:52 1973\n\0
```

using the equivalent of the following algorithm:

```
char *asctime(const struct tm *timeptr)
{
    static char wday_name[7][3] = {
        "Sun", "Mon", "Tue", "Wed", "Thu", "Fri", "Sat"
    };
    static char mon_name[12][3] = {
        "Jan", "Feb", "Mar", "Apr", "May", "Jun",
        "Jul", "Aug", "Sep", "Oct", "Nov", "Dec"
    };
    static char result[26];

    sprintf(result, "%.3s %.3s%3d %.2d:%.2d:%.2d %d\n",
        wday_name[timeptr->tm_wday],
        mon_name[timeptr->tm_mon],
        timeptr->tm_mday, timeptr->tm_hour,
        timeptr->tm_min, timeptr->tm_sec,
        1900 + timeptr->tm_year);
    return result;
}
```

The **tm** structure is defined in the **<time.h>** header.

CX The *asctime*( ), *ctime*( ), *gmtime*( ), and *localtime*( ) functions shall return values in one of two static objects: a broken-down time structure and an array of type **char**. Execution of any of the functions may overwrite the information returned in either of these objects by any of the other functions.

The *asctime*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

TSF The *asctime_r*( ) function shall convert the broken-down time in the structure pointed to by *tm* into a string (of the same form as that returned by *asctime*( )) that is placed in the user-supplied buffer pointed to by *buf* (which contains at least 26 bytes) and then return *buf*.

RETURN VALUE

Upon successful completion, *asctime*( ) shall return a pointer to the string.

TSF Upon successful completion, *asctime_r*( ) shall return a pointer to a character string containing the date and time. This string is pointed to by the argument *buf*. If the function is unsuccessful, it shall return NULL.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

Values for the broken-down time structure can be obtained by calling *gmtime*( ) or *localtime*( ). This function is included for compatibility with older implementations, and does not support localized date and time formats. Applications should use *strftime*( ) to achieve maximum portability.

The *asctime_r*( ) function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

clock( ), *ctime*( ), *difftime*( ), *gmtime*( ), *localtime*( ), *mktime*( ), *strftime*( ), *strptime*( ), *time*( ), *utime*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<time.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The location of the **tm** structure is now defined.

The APPLICATION USAGE section is expanded to describe the time-handling functions generally and to refer users to *strftime*( ), which is a locale-dependent time-handling function.

The following change is incorporated for alignment with the ISO C standard:

- The type of argument *timeptr* is changed from **struct tm*** to **const struct tm***.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

The *asctime_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *asctime*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *asctime_r*( ) function is marked as part of the Thread-Safe Functions option.

Extensions beyond the ISO C standard are now marked.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

The DESCRIPTION of *asctime_r*( ) is updated to describe the format of the string returned.

The **restrict** keyword is added to the *asctime_r*( ) prototype for alignment with the ISO / IEC 9899: 1999 standard.

4622 **NAME**

4623 asin, asinf, asinl — arc sine function

4624 **SYNOPSIS**

4625
```
#include <math.h>
```

4626
```
double asin(double x);
```
4627
```
float asinf(float x);
```
4628
```
long double asinl(long double x);
```

4629 **DESCRIPTION**

4630 CX The functionality described on this reference page is aligned with the ISO C standard. Any
4631 conflict between the requirements described here and the ISO C standard is unintentional. This
4632 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

4633 The *asin*( ), *asinf*( ), and *asinl*( ) functions shall compute the principal value of the arc sine of *x*.
4634 The value of *x* should be in the range [–1,1].

4635 An application wishing to check for error situations should set *errno* to 0, then call *asin*( ). If *errno*
4636 is non-zero on return, or the return value is NaN, an error has occurred.

4637 **RETURN VALUE**

4638 Upon successful completion, the *asin*( ), *asinf*( ), and *asinl*( ) functions shall return the arc sine of
4639 XSI *x*, in the range [–π/2,π/2] radians. If the value of *x* is not in the range [–1,1], and is not ±Inf or
4640 NaN, either 0.0 or NaN shall be returned and *errno* shall be set to [EDOM].

4641 XSI If *x* is NaN, NaN shall be returned and *errno* may be set to [EDOM].

4642 If *x* is ±Inf, either 0.0 shall be returned and *errno* set to [EDOM], or NaN shall be returned and
4643 *errno* may be set to [EDOM].

4644 If the result underflows, 0.0 shallbe returned and *errno* may be set to [ERANGE].

4645 **ERRORS**

4646 The *asin*( ), *asinf*( ), and *asinl*( ) functions shall fail if:

4647 XSI [EDOM] The value *x* is not ±Inf or NaN and is not in the range [–1,1].

4648 The *asin*( ), *asinf*( ), and *asinl*( ) functions may fail if:

4649 XSI [EDOM] The value of *x* is ±Inf or NaN.

4650 [ERANGE] The result underflows

4651 XSI No other errors shall occur.

4652 **EXAMPLES**

4653 None.

4654 **APPLICATION USAGE**

4655 None.

4656 **RATIONALE**

4657 None.

4658 **FUTURE DIRECTIONS**

4659 None.

4660 **SEE ALSO**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

References to *matherr*( ) are removed.

The RETURN VALUE and ERRORS sections are substantially rewritten for alignment with the ISO C standard and to rationalize error handling in the mathematics functions.

The return value specified for [EDOM] is marked as an extension.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *asinf*( ) and *asinl*( ) functions are added for alignment with the ISO / IEC 9899: 1999 standard.

4674 **NAME**

4675 asinh — hyperbolic arc sine

4676 **SYNOPSIS**

4677 XSI
```
#include <math.h>
```

4678
```
double asinh(double x);
```

4679

4680 **DESCRIPTION**

4681 Refer to *acosh*( ).

NAME

assert — insert program diagnostics

SYNOPSIS

```
#include <assert.h>

void assert(scalar expression);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

The *assert*( ) macro inserts diagnostics into programs; it expands to a **void** expression. When it is executed, if *expression* (which shall have a **scalar** type) is false (that is, compares equal to 0), *assert*( ) shall write information about the particular call that failed on *stderr* and shall call *abort*( ).

The information written about the call that failed shall include the text of the argument, the name of the source file, the source file line number, and the name of the enclosing function, the latter are, respectively, the values of the preprocessing macros __FILE__ and __LINE__ and of the identifier __func__.

Forcing a definition of the name NDEBUG, either from the compiler command line or with the preprocessor control statement **#define** NDEBUG ahead of the **#include <assert.h>** statement, shall stop assertions from being compiled into the program.

RETURN VALUE

The *assert*( ) macro shall return no value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The APPLICATION USAGE section is merged into the DESCRIPTION.

Issue 6

The prototype for the *expression* argument to *assert*( ) is changed from **int** to **scalar** for alignment with the ISO / IEC 9899: 1999 standard.

The DESCRIPTION of *assert*( ) is updated for alignment with the ISO / IEC 9899: 1999 standard.

4723 **NAME**

4724 atan, atanf, atanl — arc tangent function

4725 **SYNOPSIS**

4726
```
#include <math.h>
```

4727
```
double atan(double x);
```
4728
```
float atanf(float x);
```
4729
```
long double atanl(long double x);
```

4730 **DESCRIPTION**

4731 CX The functionality described on this reference page is aligned with the ISO C standard. Any
4732 conflict between the requirements described here and the ISO C standard is unintentional. This
4733 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

4734 The *atan*( ), *atanf*( ), and *atanl*( ) functions shall compute the principal value of the arc tangent of
4735 *x*.

4736 An application wishing to check for error situations should set *errno* to 0 before calling *atan*( ). If
4737 *errno* is non-zero on return, or the return value is NaN, an error has occurred.

4738 **RETURN VALUE**

4739 Upon successful completion, the *atan*( ), *atanf*( ), and *atanl*( ) functions shall return the arc
4740 tangent of *x* in the range $[-\pi/2,\pi/2]$ radians.

4741 XSI If *x* is NaN, NaN shall be returned and *errno* may be set to [EDOM].

4742 If the result underflows, 0.0 shall be returned and *errno* may be set to [ERANGE].

4743 **ERRORS**

4744 The *atan*( ), *atanf*( ), and *atanl*( ) functions may fail if:

4745 XSI [EDOM] The value of *x* is NaN.

4746 [ERANGE] The result underflows

4747 XSI No other errors shall occur.

4748 **EXAMPLES**

4749 None.

4750 **APPLICATION USAGE**

4751 None.

4760 **Issue 4**

4761 References to *matherr*( ) are removed.

4762 The RETURN VALUE and ERRORS sections are substantially rewritten for alignment with the
4763 ISO C standard and to rationalize error handling in the mathematics functions.

The return value specified for [EDOM] is marked as an extension.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *atanf*( ) and *atanl*( ) functions are added for alignment with the ISO / IEC 9899: 1999 standard.

4770 **NAME**

4771 atan2 — arc tangent function

4772 **SYNOPSIS**

4773 ```
#include <math.h>
```

4774 ```
double atan2(double y, double x);
```
4775 ```
float atan2f(float y, float x);
```
4776 ```
long double atan2l(long double y, long double x);
```

4777 **DESCRIPTION**

4778 CX The functionality described on this reference page is aligned with the ISO C standard. Any
4779 conflict between the requirements described here and the ISO C standard is unintentional. This
4780 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

4781 The *atan2*( ), *atan2f*( ), and *atan2l*( ) functions shall compute the principal value of the arc tangent
4782 of *y* /*x*, using the signs of both arguments to determine the quadrant of the return value.

4783 An application wishing to check for error situations should set *errno* to 0 before calling *atan2*( ).
4784 If *errno* is non-zero on return, or the return value is NaN, an error has occurred.

4785 **RETURN VALUE**

4786 Upon successful completion, the *atan2*( ), *atan2f*( ), and *atan2l*( ) functions shall return the arc
4787 tangent of *y* /*x* in the range [–π,π] radians. If both arguments are 0.0, an implementation-defined
4788 value is returned and *errno* may be set to [EDOM].

4789 XSI If *x* or *y* is NaN, NaN shall be returned and *errno* may be set to [EDOM].

4790 If the result underflows, 0.0 shall be returned and *errno* may be set to [ERANGE].

4791 **ERRORS**

4792 The *atan2*( ), *atan2f*( ), and *atan2l*( ) functions may fail if:

4793 XSI [EDOM] Both arguments are 0.0 or one or more of the arguments is NaN.

4794 [ERANGE] The result underflows

4795 XSI No other errors shall occur.

4796 **EXAMPLES**

4797 None.

4798 **APPLICATION USAGE**

4799 None.

4800 **RATIONALE**

```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

The *atexit*( ) function registers the function pointed to by *func*, to be called without arguments at normal program termination. At normal program termination, all functions registered by the CX *atexit*( ) function shall be called, in the reverse order of their registration. Normal termination occurs either by a call to *exit*( ) or a return from *main*( ).

At least 32 functions can be registered with *atexit*( ).

CX After a successful call to any of the *exec* functions, any functions previously registered by *atexit*( ) shall no longer be registered.

RETURN VALUE

Upon successful completion, *atexit*( ) shall return 0; otherwise, it shall return a non-zero value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The functions registered by a call to *atexit*( ) must return to ensure that all registered functions are called.

The application should call *sysconf*( ) to obtain the value of {ATEXIT_MAX}, the number of functions that can be registered. There is no way for an application to tell how many functions have already been registered with *atexit*( ).

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

exit( ), *sysconf*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdlib.h>**

CHANGE HISTORY

First released in Issue 4. Derived from the ANSI C standard.

Issue 4, Version 2

The APPLICATION USAGE section is updated to indicate how an application can determine the setting of {ATEXIT_MAX}, which is a constant added for X/OPEN UNIX conformance.

Issue 6

Extensions beyond the ISO C standard are now marked.

4865 **NAME**

4866 atof — convert a string to double-precision number

4867 **SYNOPSIS**

4868 ```
#include <stdlib.h>
```

4869 ```
double atof(const char *str);
```

4870 **DESCRIPTION**

4871 CX The functionality described on this reference page is aligned with the ISO C standard. Any
4872 conflict between the requirements described here and the ISO C standard is unintentional. This
4873 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

4874 The call *atof*(*str*) shall be equivalent to:

4875 ```
strtod(str,(char **)NULL),
```

4876 except that the handling of errors may differ. If the value cannot be represented, the behavior is
4877 undefined.

4878 **RETURN VALUE**

4879 The *atof*( ) function shall return the converted value if the value can be represented.

4880 **ERRORS**

4881 No errors are defined.

4882 **EXAMPLES**

4883 None.

4884 **APPLICATION USAGE**

4885 The *atof*( ) function is subsumed by *strtod*( ) but is retained because it is used extensively in
4886 existing code. If the number is not known to be in range, *strtod*( ) should be used because *atof*( ) is
4887 not required to perform any error checking.

4888 **RATIONALE**

4889 None.

4890 **FUTURE DIRECTIONS**

4891 None.

4892 **SEE ALSO**

4893 *strtod*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdlib.h>** |

4894 **CHANGE HISTORY**

4895 First released in Issue 1. Derived from Issue 1 of the SVID. |

4896 **Issue 4**

4897 Reference to how *str* is converted is removed from the DESCRIPTION.

4898 The APPLICATION USAGE section is added.

4899 The following change is incorporated for alignment with the ISO C standard:

4900 - The type of argument *str* is changed from **char*** to **const char***.
```

NAME

atoi — convert a string to an integer

SYNOPSIS

```
#include <stdlib.h>

int atoi(const char *str);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

The call *atoi*(*str*) shall be equivalent to:

```
(int) strtol(str, (char **)NULL, 10)
```

except that the handling of errors may differ. If the value cannot be represented, the behavior is undefined.

RETURN VALUE

The *atoi*( ) function shall return the converted value if the value can be represented.

ERRORS

No errors are defined.

EXAMPLES

Converting an Argument

The following example checks for proper usage of the program. If there is an argument and the decimal conversion of this argument (obtained using *atoi*( )) is greater than 0, then the program has a valid number of minutes to wait for an event.

```
#include <stdlib.h>
#include <stdio.h>
...
int minutes_to_event;
...
if (argc < 2 || ((minutes_to_event = atoi (argv[1]))) <= 0) {
   fprintf(stderr, "Usage: %s minutes\n", argv[0]); exit(1);
}
...
```

APPLICATION USAGE

The *atoi*( ) function is subsumed by *strtol*( ) but is retained because it is used extensively in existing code. If the number is not known to be in range, *strtol*( ) should be used because *atoi*( ) is not required to perform any error checking.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

4942 **CHANGE HISTORY**

4943 First released in Issue 1. Derived from Issue 1 of the SVID.

4944 **Issue 4**

4945 Reference to how *str* is converted is removed from the DESCRIPTION.

4946 The APPLICATION USAGE section is added.

4947 The following change is incorporated for alignment with the ISO C standard:

4948 • The type of argument *str* is changed from **char*** to **const char***.

NAME

atol, atoll — convert a string to a long integer

SYNOPSIS

```
#include <stdlib.h>

long atol(const char *str);
long long atoll(const char *nptr);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

The call *atol*(*str*) shall be equivalent to:

```
strtol(str, (char **)NULL, 10)
```

The call *atoll*(*str*) shall be equivalent to:

```
strtoll(nptr, (char **)NULL, 10)
```

except that the handling of errors may differ. If the value cannot be represented, the behavior is undefined.

RETURN VALUE

These functions shall return the converted value if the value can be represented.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The *atol*( ) function is subsumed by *strtol*( ) but is retained because it is used extensively in existing code. If the number is not known to be in range, *strtol*( ) should be used because *atol*( ) is not required to perform any error checking.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

strtol( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdlib.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

Reference to how *str* is converted is removed from the DESCRIPTION.

The APPLICATION USAGE section is added.

The following changes are incorporated for alignment with the ISO C standard:

- The type of argument *str* is changed from **char*** to **const char***.
- The return type of the function is expanded to **long**.

Issue 6

The *atoll*( ) function is added for alignment with the ISO / IEC 9899: 1999 standard.

NAME

basename — return the last component of a path name

SYNOPSIS

XSI
```
#include <libgen.h>

char *basename(char *path);
```

DESCRIPTION

The *basename*( ) function shall take the path name pointed to by *path* and return a pointer to the final component of the path name, deleting any trailing `'/'` characters.

If the string consists entirely of the `'/'` character, *basename*( ) shall return a pointer to the string `"/"`. If the string is exactly `"//"`, it is implementation-defined whether `'/'` or `"//"` is returned.

If *path* is a null pointer or points to an empty string, *basename*( ) shall return a pointer to the string `"."`.

The *basename*( ) function may modify the string pointed to by *path*, and may return a pointer to static storage that may then be overwritten by a subsequent call to *basename*( ).

The *basename*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

The *basename*( ) function shall return a pointer to the final component of *path*.

ERRORS

No errors are defined.

EXAMPLES

Using basename( )

The following program fragment returns a pointer to the value *lib*, which is the base name of **/usr/lib**.

```
#include <libgen.h>
...
char *name = "/usr/lib";
char *base;

base = basename(name);
...
```

Sample Input and Output Strings for basename( )

In the following table, the input string is the value pointed to by *path*, and the output string is the return value of the *basename*( ) function.

Input String	Output String
`"/usr/lib"`	`"lib"`
`"/usr/"`	`"usr"`
`"/"`	`"/"`

5030 **APPLICATION USAGE**

5031 None.

5038 Utilities volume of IEEE Std. 1003.1-200x, *basename* |

5039 **CHANGE HISTORY**

5040 First released in Issue 4, Version 2.

5041 **Issue 5**

5042 Moved from X/OPEN UNIX extension to BASE.

5043 Normative text previously in the APPLICATION USAGE section is moved to the
5044 DESCRIPTION.

5045 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

5046 **Issue 6**

5047 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

NAME

bcmp — memory operations (**LEGACY**)

SYNOPSIS

XSI
```
#include <strings.h>

int bcmp(const void *s1, const void *s2, size_t n);
```

DESCRIPTION

The *bcmp*( ) function shall compare the first *n* bytes of the area pointed to by *s1* with the area pointed to by *s2*.

RETURN VALUE

The *bcmp*( ) function shall return 0 if *s1* and *s2* are identical; otherwise, it shall return non-zero. Both areas are assumed to be *n* bytes long. If the value of *n* is 0, *bcmp*( ) shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

memcmp( ) is preferred over this function.

For maximum portability, it is recommended to replace the function call to *bcmp*( ) as follows:

```
#define bcmp(b1,b2,len) memcmp((b1), (b2), (size_t)(len))
```

RATIONALE

None.

FUTURE DIRECTIONS

This function may be withdrawn in a future version.

SEE ALSO

memcmp( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<strings.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

This function is marked LEGACY.

NAME

bcopy — memory operations (**LEGACY**)

SYNOPSIS

XSI
```
#include <strings.h>

void bcopy(const void *s1, void *s2, size_t n);
```

DESCRIPTION

The *bcopy*( ) function shall copy *n* bytes from the area pointed to by *s1* to the area pointed to by *s2*.

The bytes are copied correctly even if the area pointed to by *s1* overlaps the area pointed to by *s2*.

RETURN VALUE

The *bcopy*( ) function shall return no value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

memmove( ) is preferred over this function.

The following are approximately equivalent (note the order of the arguments):

```
bcopy(s1,s2,n) ~= memmove(s2,s1,n)
```

For maximum portability, it is recommended to replace the function call to *bcopy*( ) as follows:

```
#define bcopy(b1,b2,len) (memmove((b2), (b1), (len)), (void) 0)
```

RATIONALE

None.

FUTURE DIRECTIONS

This function may be withdrawn in a future version.

SEE ALSO

memmove( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<strings.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

This function is marked LEGACY.

NAME

bind — bind a name to a socket

SYNOPSIS

```
#include <sys/socket.h>

int bind(int socket, const struct sockaddr *address,
    socklen_t address_len);
```

DESCRIPTION

The *bind*( ) function shall assign a local socket address *address* to a socket identified by descriptor *socket* that has no local socket address assigned. Sockets created with the *socket*( ) function are initially unnamed; they are identified only by their address family.

The *bind*( ) function takes the following arguments:

socket Specifies the file descriptor of the socket to be bound.

address Points to a **sockaddr** structure containing the address to be bound to the socket. The length and format of the address depend on the address family of the socket.

address_len Specifies the length of the **sockaddr** structure pointed to by the *address* argument.

The socket specified by *socket* may require the process to have appropriate privileges to use the *bind*( ) function.

RETURN VALUE

Upon successful completion, *bind*( ) shall return 0; otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *bind*( ) function shall fail if:

[EADDRINUSE]
The specified address is already in use.

[EADDRNOTAVAIL]
The specified address is not available from the local machine.

[EAFNOSUPPORT]
The specified address is not a valid address for the address family of the specified socket.

[EBADF] The *socket* argument is not a valid file descriptor.

[EINVAL] The socket is already bound to an address, and the protocol does not support binding to a new address; or the socket has been shut down.

[ENOTSOCK] The *socket* argument does not refer to a socket.

[EOPNOTSUPP] The socket type of the specified socket does not support binding to an address.

If the address family of the socket is AF_UNIX, then *bind*( ) shall fail if:

[EACCES] A component of the path prefix denies search permission, or the requested name requires writing in a directory with a mode that denies write permission.

[EDESTADDRREQ] or [EISDIR]
The *address* argument is a null pointer.

[EIO] An I/O error occurred.

[ELOOP] A loop exists in symbolic links encountered during resolution of the path name in *address*.

[ENAMETOOLONG]
A component of a path name exceeded {NAME_MAX} characters, or an entire path name exceeded {PATH_MAX} characters.

[ENOENT] A component of the path name does not name an existing file or the path name is an empty string.

[ENOTDIR] A component of the path prefix of the path name in *address* is not a directory.

[EROFS] The name would reside on a read-only file system.

The *bind*( ) function may fail if:

[EACCES] The specified address is protected and the current user does not have permission to bind to it.

[EINVAL] The *address_len* argument is not a valid length for the address family.

[EISCONN] The socket is already connected.

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the path name in *address*.

[ENAMETOOLONG]
Path name resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}.

[ENOBUFS] Insufficient resources were available to complete the call.

EXAMPLES

None.

APPLICATION USAGE

An application program can retrieve the assigned socket name with the *getsockname*( ) function.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

connect( ), *getsockname*( ), *listen*( ), *socket*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<sys/socket.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

NAME

bsd_signal — simplified signal facilities

SYNOPSIS

OB

```
#include <signal.h>

void (*bsd_signal(int sig, void (*func)(int)))(int);
```

DESCRIPTION

The *bsd_signal*( ) function provides a partially compatible interface for programs written to historical system interfaces (see APPLICATION USAGE).

The function call *bsd_signal*(*sig*, *func*) has an effect as if implemented as:

```
void (*bsd_signal(int sig, void (*func)(int)))(int)
{
    struct sigaction act, oact;

    act.sa_handler = func;
    act.sa_flags = SA_RESTART;
    sigemptyset(&act.sa_mask);
    sigaddset(&act.sa_mask, sig);
    if (sigaction(sig, &act, &oact) == -1)
        return(SIG_ERR);
    return(oact.sa_handler);
}
```

The handler function should be declared:

```
void handler(int sig);
```

where *sig* is the signal number. The behavior is undefined if *func* is a function that takes more than one argument, or an argument of a different type.

RETURN VALUE

Upon successful completion, *bsd_signal*( ) shall return the previous action for *sig*. Otherwise, SIG_ERR shall be returned and *errno* shall be set to indicate the error.

ERRORS

Refer to *sigaction*( ).

EXAMPLES

None.

APPLICATION USAGE

This function is a direct replacement for the BSD *signal*( ) function for simple applications that are installing a single-argument signal handler function. If a BSD signal handler function is being installed that expects more than one argument, the application has to be modified to use *sigaction*( ). The *bsd_signal*( ) function differs from *signal*( ) in that the SA_RESTART flag is set and the SA_RESETHAND is clear when *bsd_signal*( ) is used. The state of these flags is not specified for *signal*( ).

It is recommended that new applications use the *sigaction*( ) function.

RATIONALE

None.

5234 **FUTURE DIRECTIONS**

5235 None.

5244 This function is marked obsolescent. |

NAME

bsearch — binary search a sorted table

SYNOPSIS

```
#include <stdlib.h>

void *bsearch(const void *key, const void *base, size_t nel,
    size_t width, int (*compar)(const void *, const void *));
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

The *bsearch*( ) function searches an array of *nel* objects, the initial element of which is pointed to by *base*, for an element that matches the object pointed to by *key*. The size of each element in the array is specified by *width*.

The comparison function pointed to by *compar* is called with two arguments that point to the *key* object and to an array element, in that order.

The application shall ensure that the function returns an integer less than, equal to, or greater than 0 if the *key* object is considered, respectively, to be less than, to match, or to be greater than the array element. The application shall ensure that the array consists of all the elements that compare less than, all the elements that compare equal to, and all the elements that compare greater than the *key* object, in that order.

RETURN VALUE

The *bsearch*( ) function shall return a pointer to a matching member of the array, or a null pointer if no match is found. If two or more members compare equal, which member is returned is unspecified.

ERRORS

No errors are defined.

EXAMPLES

The example below searches a table containing pointers to nodes consisting of a string and its length. The table is ordered alphabetically on the string in the node pointed to by each entry.

The code fragment below reads in strings and either finds the corresponding node and prints out the string and its length, or prints an error message.

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>

#define TABSIZE    1000

struct node {                   /* These are stored in the table. */
    char *string;
    int length;
};
struct node table[TABSIZE];     /* Table to be searched. */
    .
    .
    .
{
    struct node *node_ptr, node;
    /* routine to compare 2 nodes */
```

```
        int node_compare(const void *, const void *);
        char str_space[20];   /* Space to read string into. */
        .
        .
        .
        node.string = str_space;
        while (scanf("%s", node.string) != EOF) {
            node_ptr = (struct node *)bsearch((void *)(&node),
                   (void *)table, TABSIZE,
                   sizeof(struct node), node_compare);
            if (node_ptr != NULL) {
                (void)printf("string = %20s, length = %d\n",
                    node_ptr->string, node_ptr->length);
            } else {
                (void)printf("not found: %s\n", node.string);
            }
        }
    }
    /*
        This routine compares two nodes based on an
        alphabetical ordering of the string field.
    */
    int
    node_compare(const void *node1, const void *node2)
    {
        return strcoll(((const struct node *)node1)->string,
            ((const struct node *)node2)->string);
    }
```

APPLICATION USAGE

The pointers to the key and the element at the base of the table should be of type pointer-to-element.

The comparison function need not compare every byte, so arbitrary data may be contained in the elements in addition to the values being compared.

In practice, the array is usually sorted according to the comparison function.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

hcreate( ), *lsearch*( ), *qsort*( ), *tsearch*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdlib.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

Text indicating the need for various casts is removed from the APPLICATION USAGE section.

The code in the EXAMPLES section is changed to use *strcoll*( ) instead of *strcmp*( ) in *node_compare*( ).

The return value and the contents of the array are now requirements on the application.

The DESCRIPTION is changed to specify the order of arguments.

The following changes are incorporated for alignment with the ISO C standard:

- The type of arguments *key* and *base*, and the type of arguments to *compar*, are changed from **void*** to **const void***.
- The requirement that the table be sorted according to *compar* is removed from the DESCRIPTION.

Issue 6

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

5347 **NAME**

5348 btowc — single-byte to wide-character conversion

5349 **SYNOPSIS**

5350 ```
#include <stdio.h>
```

5351 ```
#include <wchar.h>
```

5352 ```
wint_t btowc(int c);
```

5353 **DESCRIPTION**

5354 CX The functionality described on this reference page is aligned with the ISO C standard. Any
5355 conflict between the requirements described here and the ISO C standard is unintentional. This
5356 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

5357 The *btowc*( ) function shall determine whether *c* constitutes a valid (one-byte) character in the
5358 initial shift state.

5359 The behavior of this function shall be affected by the *LC_CTYPE* category of the current locale.

5360 **RETURN VALUE**

5361 The *btowc*( ) function shall return WEOF if *c* has the value EOF or if **(unsigned char)** *c* does not
5362 constitute a valid (one-byte) character in the initial shift state. Otherwise, it shall return the
5363 wide-character representation of that character.

NAME

cacos, cacosf, cacosl — complex arc cosine functions

SYNOPSIS

```
#include <complex.h>

double complex cacos(double complex z);
float complex cacosf(float complex z);
long double complex cacosl(long double complex z);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

These functions shall compute the complex arc cosine of *z*, with branch cuts outside the interval [–1, +1] along the real axis.

RETURN VALUE

These functions shall return the complex arc cosine value, in the range of a strip mathematically unbounded along the imaginary axis and in the interval [0, π] along the real axis.

ERRORS

No errors are defined.

NAME

cacosh, cacoshf, cacoshl — complex arc hyperbolic cosine functions

SYNOPSIS

```
#include <complex.h>

double complex cacosh(double complex z);
float complex cacoshf(float complex z);
long double complex cacoshl(long double complex z);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

These functions shall compute the complex arc hyperbolic cosine of *z*, with a branch cut at values less than 1 along the real axis.

RETURN VALUE

These functions shall return the complex arc hyperbolic cosine value, in the range of a half-strip of non-negative values along the real axis and in the interval $[-i\pi, +i\pi]$ along the imaginary axis.

ERRORS

No errors are defined.

NAME

calloc — a memory allocator

SYNOPSIS

```
#include <stdlib.h>

void *calloc(size_t nelem, size_t elsize);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

The *calloc*( ) function allocates unused space for an array of *nelem* elements each of whose size in bytes is *elsize*. The space is initialized to all bits 0.

The order and contiguity of storage allocated by successive calls to *calloc*( ) is unspecified. The pointer returned if the allocation succeeds is suitably aligned so that it may be assigned to a pointer to any type of object and then used to access such an object or an array of such objects in the space allocated (until the space is explicitly freed or reallocated). Each such allocation shall yield a pointer to an object disjoint from any other object. The pointer returned points to the start (lowest byte address) of the allocated space. If the space cannot be allocated, a null pointer is returned. If the size of the space requested is 0, the behavior is implementation-defined; the value returned shall be either a null pointer or a unique pointer.

RETURN VALUE

Upon successful completion with both *nelem* and *elsize* non-zero, *calloc*( ) shall return a pointer to the allocated space. If either *nelem* or *elsize* is 0, then either a null pointer or a unique pointer value that can be successfully passed to *free*( ) shall be returned. Otherwise, it shall return a null pointer CX and set *errno* to indicate the error.

ERRORS

The *calloc*( ) function shall fail if:

CX [ENOMEM] Insufficient memory is available.

EXAMPLES

None.

APPLICATION USAGE

There is now no requirement for the implementation to support the inclusion of **<malloc.h>**.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

free( ), *malloc*( ), *realloc*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdlib.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The setting of *errno* and the [ENOMEM] error are marked as extensions.

The APPLICATION USAGE section is changed to record that **<malloc.h>** need no longer be supported on XSI-conformant systems.

The following changes are incorporated in this issue for alignment with the ISO C standard:

- The DESCRIPTION is updated to indicate:
  - — The order and contiguity of storage allocated by successive calls to this function is unspecified.
  - — Each allocation yields a pointer to an object disjoint from any other object.
  - — The returned pointer points to the lowest byte address of the allocation.
  - — The behavior if space is requested of zero size.
- The RETURN VALUE section is updated to indicate what is returned if either *nelem* or *elsize* is 0.

Issue 6

Extensions beyond the ISO C standard are now marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The setting of *errno* and the [ENOMEM] error condition are mandatory if an insufficient memory condition occurs.

NAME

carg, cargf, cargl — complex argument functions

SYNOPSIS

```
#include <complex.h>

double carg(double complex z);
float cargf(float complex z);
long double cargl(long double complex z);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

These functions shall compute the argument (also called phase angle) of *z*, with a branch cut along the negative real axis.

RETURN VALUE

These functions shall return the value of the argument in the interval [–π, +π].

ERRORS

No errors are defined.

5708 **NAME**

5709 catclose — close a message catalog descriptor

5710 **SYNOPSIS**

5711 XSI
```
#include <nl_types.h>
```

5712
```
int catclose(nl_catd catd);
```

5713

5714 **DESCRIPTION**

5715 The *catclose*( ) function shall close the message catalog identified by *catd*. If a file descriptor is
5716 used to implement the type **nl_catd**, that file descriptor shall be closed.

5717 **RETURN VALUE**

5718 Upon successful completion, *catclose*( ) shall return 0; otherwise, –1 shall be returned, and *errno*
5719 set to indicate the error.

5720 **ERRORS**

5721 The *catclose*( ) function may fail if:

5722 [EBADF] The catalog descriptor is not valid. |

5723 [EINTR] The *catclose*( ) function was interrupted by a signal. |

5724 **EXAMPLES**

5725 None.

5726 **APPLICATION USAGE**

5727 None.

5728 **RATIONALE**

5729 None.

5730 **FUTURE DIRECTIONS**

5734 **CHANGE HISTORY**

5735 First released in Issue 2.

5736 **Issue 4**

5737 The [EBADF] and [EINTR] errors are added to the ERRORS section.

NAME

catgets — read a program message

SYNOPSIS

XSI

```
#include <nl_types.h>

char *catgets(nl_catd catd, int set_id, int msg_id, const char *s);
```

DESCRIPTION

The *catgets*( ) function attempts to read message *msg_id*, in set *set_id*, from the message catalog identified by *catd*. The *catd* argument is a message catalog descriptor returned from an earlier call to *catopen*( ). The *s* argument points to a default message string which shall be returned by *catgets*( ) if it cannot retrieve the identified message.

The *catgets*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

If the identified message is retrieved successfully, *catgets*( ) shall return a pointer to an internal buffer area containing the null-terminated message string. If the call is unsuccessful for any reason, *s* shall be returned and *errno* may be set to indicate the error.

ERRORS

The *catgets*( ) function may fail if:

[EBADF]	The *catd* argument is not a valid message catalog descriptor open for reading.
[EINTR]	The read operation was terminated due to the receipt of a signal, and no data was transferred.
[EINVAL]	The message catalog identified by *catd* is corrupted.
[ENOMSG]	The message identified by *set_id* and *msg_id* is not in the message catalog.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

catclose( ), *catopen*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<nl_types.h>**

CHANGE HISTORY

First released in Issue 2.

Issue 4

The type of argument *s* is changed from **char*** to **const char***.

The [EBADF] and [EINTR] errors are added to the ERRORS section.

Issue 4, Version 2

The following changes are incorporated for X/OPEN UNIX conformance:

- The RETURN VALUE section notes that *errno* may be set to indicate an error.
- In the ERRORS section, [EINVAL] and [ENOMSG] are added as optional errors.

Issue 5

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

Issue 6

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

NAME

catopen — open a message catalog

SYNOPSIS

XSI
```
#include <nl_types.h>

nl_catd catopen(const char *name, int oflag);
```

DESCRIPTION

The *catopen*( ) function shall open a message catalog and return a message catalog descriptor. The *name* argument specifies the name of the message catalog to be opened. If *name* contains a `'/'`, then *name* specifies a complete name for the message catalog. Otherwise, the environment variable *NLSPATH* is used with *name* substituted for %*N* (see the Base Definitions volume of IEEE Std. 1003.1-200x, Chapter 8, Environment Variables). If *NLSPATH* does not exist in the environment, or if a message catalog cannot be found in any of the components specified by *NLSPATH*, then an implementation-defined default path is used. This default may be affected by the setting of *LC_MESSAGES* if the value of *oflag* is NL_CAT_LOCALE, or the *LANG* environment variable if *oflag* is 0.

A message catalog descriptor remains valid in a process until that process closes it, or a successful call to one of the *exec* functions. A change in the setting of the *LC_MESSAGES* category may invalidate existing open catalogs.

If a file descriptor is used to implement message catalog descriptors, the FD_CLOEXEC flag shall be set; see **<fcntl.h>**.

If the value of the *oflag* argument is 0, the *LANG* environment variable is used to locate the catalog without regard to the *LC_MESSAGES* category. If the *oflag* argument is NL_CAT_LOCALE, the *LC_MESSAGES* category is used to locate the message catalog (see the Base Definitions volume of IEEE Std. 1003.1-200x, Section 8.2, Internationalization Variables).

RETURN VALUE

Upon successful completion, *catopen*( ) shall return a message catalog descriptor for use on subsequent calls to *catgets*( ) and *catclose*( ). Otherwise, *catopen*( ) shall return (**nl_catd**) –1 and set *errno* to indicate the error.

ERRORS

The *catopen*( ) function may fail if:

[EACCES] Search permission is denied for the component of the path prefix of the message catalog or read permission is denied for the message catalog.

[EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

[ENAMETOOLONG]
The length of a path name of the message catalog exceeds {PATH_MAX} or a path name component is longer than {NAME_MAX}.

[ENAMETOOLONG]
Path name resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}.

[ENFILE] Too many files are currently open in the system.

[ENOENT] The message catalog does not exist or the *name* argument points to an empty string.

[ENOMEM] Insufficient storage space is available.

[ENOTDIR] A component of the path prefix of the message catalog is not a directory.

EXAMPLES

None.

APPLICATION USAGE

Some implementations of *catopen*( ) use *malloc*( ) to allocate space for internal buffer areas. The *catopen*( ) function may fail if there is insufficient storage space available to accommodate these buffers.

Portable applications must assume that message catalog descriptors are not valid after a call to one of the *exec* functions.

Application writers should be aware that guidelines for the location of message catalogs have not yet been developed. Therefore they should take care to avoid conflicting with catalogs used by other applications and the standard utilities.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

catclose( ), *catgets*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<fcntl.h>**, **<nl_types.h>**, the Shell and Utilities volume of IEEE Std. 1003.1-200x

CHANGE HISTORY

First released in Issue 2.

Issue 4

The type of argument *name* is changed from **char*** to **const char***.

The DESCRIPTION is updated:

- To indicate the longevity of message catalog descriptors.
- To specify values for the *oflag* argument and the effect of *LC_MESSAGES* and *NLSPATH*.

The [EACCES], [EMFILE], [ENAMETOOLONG], [ENFILE], [ENOENT], and [ENOTDIR] errors are added to the ERRORS section.

The APPLICATION USAGE section is updated to indicate:

- Portable applications should not assume the continued validity of message catalog descriptors after a call to one of the *exec* functions.
- Message catalogs must be located with care.

Issue 4, Version 2

The following change is incorporated for X/OPEN UNIX conformance:

- In the ERRORS section, an [ENAMETOOLONG] condition is defined that may report excessive length of an intermediate result of path name resolution of a symbolic link.

NAME

cbrt, cbrtf, cbrtl — cube root functions

SYNOPSIS

```
#include <math.h>

double cbrt(double x);
float cbrtf(float x);
long double cbrtl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

These functions shall compute the real cube root of *x*.

An application wishing to check for error situations should set *errno* to 0 before calling these functions. If *errno* is non-zero on return, or the return value is NaN, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the cube root of *x*.

If *x* is ±Inf, these functions shall return *x*.

If *x* is NaN, NaN shall be returned and *errno* may be set to [EDOM].

ERRORS

These functions may fail if:

[EDOM] The value of *x* is NaN.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

For some applications, a true cube root function, which returns negative results for negative arguments, is more appropriate than *pow*(*x*, 1.0/3.0), which returns a NaN for *x* less than 0.

FUTURE DIRECTIONS

None.

SEE ALSO

The Base Definitions volume of IEEE Std. 1003.1-200x, **<math.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The *cbrt*( ) function is no longer marked XSI.

The *cbrtf*( ) and *cbrtl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

First released in Issue 6. Derived from the ISO / IEC 9899: 1999 standard.

5960 **NAME**

5961 ceil, ceilf, ceill — ceiling value function

5962 **SYNOPSIS**

5963
```
#include <math.h>
```

5964
```
double ceil(double x);
```
5965
```
float ceilf(float x);
```
5966
```
long double ceill(long double x);
```

5967 **DESCRIPTION**

5968 CX The functionality described on this reference page is aligned with the ISO C standard. Any
5969 conflict between the requirements described here and the ISO C standard is unintentional. This
5970 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

5971 The *ceil*( ), *ceilf*( ), and *ceill*( ) functions shall compute the smallest integral value not less than *x*.

5972 An application wishing to check for error situations should set *errno* to 0 before calling *ceil*( ). If
5973 *errno* is non-zero on return, or the return value is NaN, an error has occurred.

5974 **RETURN VALUE**

5975 Upon successful completion, the *ceil*( ), *ceilf*( ), and *ceill*( ) functions shall return the smallest
5976 integral value not less than *x*, expressed as a type **double**.

5977 XSI If *x* is NaN, NaN shall be returned and *errno* may be set to [EDOM].

5978 If the correct value would cause overflow, HUGE_VAL shall be returned and *errno* set to
5979 XSI [ERANGE]. If *x* is ±Inf or ±0, the value of *x* shall be returned.

5980 **ERRORS**

5981 The *ceil*( ), *ceilf*( ), and *ceill*( ) functions shall fail if:

5982 [ERANGE] The result overflows.

5983 The *ceil*( ), *ceilf*( ), and *ceill*( ) functions may fail if:

5984 XSI [EDOM] The value of *x* is NaN.

5985 XSI No other errors shall occur.

5986 **EXAMPLES**

5987 None.

5988 **APPLICATION USAGE**

5989 The integral value returned by *ceil*( ) as a **double** need not be expressible as an **int** or **long**. The
5990 return value should be tested before assigning it to an integer type to avoid the undefined results
5991 of an integer overflow.

5992 The *ceil*( ) function can only overflow when the floating point representation has
5993 DBL_MANT_DIG > DBL_MAX_EXP.

5994 **RATIONALE**

5995 None.

5996 **FUTURE DIRECTIONS**

5997 None.

5998 **SEE ALSO**

5999 *floor*( ), *isnan*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<math.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

References to *matherr*( ) are removed.

The RETURN VALUE and ERRORS sections are substantially rewritten for alignment with the ISO C standard and to rationalize error handling in the mathematics functions.

The return value specified for [EDOM] is marked as an extension.

Support for *x* being ±Inf or ±0 is added to the RETURN VALUE section and marked as an extension.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *ceilf*( ) and *ceill*( ) functions are added for alignment with the ISO / IEC 9899: 1999 standard.

NAME

cexp, cexpf, cexpl — complex exponential functions

SYNOPSIS

```
#include <complex.h>

double complex cexp(double complex z);
float complex cexpf(float complex z);
long double complex cexpl(long double complex z);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

These functions shall compute the complex exponent of z, defined as e^z.

RETURN VALUE

These functions shall return the complex exponential value of z.

ERRORS

No errors are defined.

NAME

cfgetispeed — get input baud rate

SYNOPSIS

```
#include <termios.h>

speed_t cfgetispeed(const struct termios *termios_p);
```

DESCRIPTION

The *cfgetispeed*( ) function shall extract the input baud rate from the **termios** structure to which the *termios_p* argument points.

This function shall return exactly the value in the **termios** data structure, without interpretation.

RETURN VALUE

Upon successful completion, *cfgetispeed*( ) shall return a value of type **speed_t** representing the input baud rate.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The term *baud* is used historically here, but is not technically correct. This is properly ''bits per second'', which may not be the same as baud. However, the term is used because of the historical usage and understanding.

The *cfgetospeed*( ), *cfgetispeed*( ), *cfsetospeed*( ), and *cfsetispeed*( ) functions do not take arguments as numbers, but rather as symbolic names. There are two reasons for this:

1. Historically, numbers were not used because of the way the rate was stored in the data structure. This is retained even though a function is now used.
2. More importantly, only a limited set of possible rates is at all portable, and this constrains the application to that set.

There is nothing to prevent an implementation to accept, as an extension, a number (such as 126) if it wished, and because the encoding of the Bxxx symbols is not specified, this can be done so no ambiguity is introduced.

Setting the input baud rate to zero was a mechanism to allow for split baud rates. Clarifications in this volume of IEEE Std. 1003.1-200x have made it possible to determine whether split rates are supported and to support them without having to treat zero as a special case. Since this functionality is also confusing, it has been declared obsolescent. The 0 argument referred to is the literal constant 0, not the symbolic constant B0. This volume of IEEE Std. 1003.1-200x does not preclude B0 from being defined as the value 0; in fact, implementations would likely benefit from the two being equivalent. This volume of IEEE Std. 1003.1-200x does not fully specify whether the previous *cfsetispeed*( ) value is retained after a *tcgetattr*( ) as the actual value or as zero. Therefore, portable applications should always set both the input speed and output speed when setting either.

In historical implementations, the baud rate information is traditionally kept in **c_cflag**. Applications should be written to presume that this might be the case (and thus not blindly copy **c_cflag**), but not to rely on it in case it is in some other field of the structure. Setting the **c_cflag** field absolutely after setting a baud rate is a non-portable action because of this. In general, the

unused parts of the flag fields might be used by the implementation and should not be blindly copied from the descriptions of one terminal device to another.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3.

Entry included for alignment with the POSIX.1-1988 standard.

Issue 4

The following changes are incorporated for alignment with the ISO POSIX-1 standard:

- The type of the argument *termios_p* is changed from **struct termios*** to **const struct termios***.
- The DESCRIPTION is changed to indicate that the function simply returns the value from *termios_p*, irrespective of how that structure was obtained. Issue 3 states that if *termios_p* was not obtained by a successful call to *tcgetattr*( ), the behavior is undefined.

NAME

cfgetospeed — get output baud rate

SYNOPSIS

```
#include <termios.h>

speed_t cfgetospeed(const struct termios *termios_p);
```

DESCRIPTION

The *cfgetospeed*( ) function shall extract the output baud rate from the **termios** structure to which the *termios_p* argument points.

This function shall return exactly the value in the **termios** data structure, without interpretation.

RETURN VALUE

Upon successful completion, *cfgetospeed*( ) shall return a value of type **speed_t** representing the output baud rate.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Refer to *cfgetispeed*( ).

FUTURE DIRECTIONS

None.

Issue 4

The following changes are incorporated for alignment with the ISO POSIX-1 standard:

- The type of the argument *termios_p* is changed from **struct termios*** to **const struct termios***.
- The DESCRIPTION is changed to indicate that the function simply returns the value from *termios_p*, irrespective of how that structure was obtained. Issue 3 states that if *termios_p* was not obtained by a successful call to *tcgetattr*( ), the behavior is undefined.

6139 **NAME**

6140 cfsetispeed — set input baud rate

6141 **SYNOPSIS**

6142 ```
#include <termios.h>
```

6143 ```
int cfsetispeed(struct termios *termios_p, speed_t speed);
```

6144 **DESCRIPTION**

6145 The *cfsetispeed*( ) function shall set the input baud rate stored in the structure pointed to by
6146 *termios_p* to *speed*.

6147 There shall be no effect on the baud rates set in the hardware until a subsequent successful call
6148 to *tcsetattr*( ) with the same **termios** structure. Similarly, errors resulting from attempts to set
6149 baud rates not supported by the terminal device need not be detected until the *tcsetattr*( )
6150 function is called.

6151 **RETURN VALUE**

6152 Upon successful completion, *cfsetispeed*( ) shall return 0; otherwise, –1 shall be returned, and |
6153 *errno* may be set to indicate the error. |

6154 **ERRORS**

6155 The *cfsetispeed*( ) function may fail if:

6156 [EINVAL] The *speed* value is not a valid baud rate. |

6157 [EINVAL] The value of *speed* is outside the range of possible speed values as specified in |
6158 **<termios.h>**. |

6159 **EXAMPLES**

6160 None.

6161 **APPLICATION USAGE**

6162 None.

6163 **RATIONALE**

6164 Refer to *cfgetispeed*( ).

6175 The first description of the [EINVAL] error is added and is marked as an extension. |

6176 **Issue 4, Version 2**

6177 The ERRORS section is changed to indicate that [EINVAL] may be returned if the specified
6178 speed is outside the range of possible speed values given in **<termios.h>**.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The optional setting of *errno* and the [EINVAL] error conditions are added.

6183 **NAME**

6184 cfsetospeed — set output baud rate

6185 **SYNOPSIS**

6186 `#include <termios.h>`

6187 `int cfsetospeed(struct termios *`*`termios_p`*`, speed_t `*`speed`*`);`

6188 **DESCRIPTION**

6189 The *cfsetospeed*( ) function shall set the output baud rate stored in the structure pointed to by
6190 *termios_p* to *speed*.

6191 There shall be no effect on the baud rates set in the hardware until a subsequent successful call
6192 to *tcsetattr*( ) with the same **termios** structure. Similarly, errors resulting from attempts to set
6193 baud rates not supported by the terminal device need not be detected until the *tcsetattr*( )
6194 function is called.

6195 **RETURN VALUE**

6196 Upon successful completion, *cfsetospeed*( ) shall return 0; otherwise, it shall return –1 and *errno* |
6197 may be set to indicate the error. |

6198 **ERRORS**

6199 The *cfsetospeed*( ) function may fail if:

6200 [EINVAL] The *speed* value is not a valid baud rate. |

6201 [EINVAL] The value of *speed* is outside the range of possible speed values as specified in |
6202 **<termios.h>**. |

6203 **EXAMPLES**

6204 None.

6205 **APPLICATION USAGE**

6206 None.

6214 Chapter 11, General Terminal Interface |

6215 **CHANGE HISTORY**

6216 First released in Issue 3.

6217 Entry included for alignment with the POSIX.1-1988 standard.

6218 **Issue 4**

6219 The first description of the [EINVAL] error is added and is marked as an extension. |

6220 **Issue 4, Version 2**

6221 The ERRORS section is changed to indicate that [EINVAL] may be returned if the specified
6222 speed is outside the range of possible speed values given in **<termios.h>**.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The optional setting of *errno* and the [EINVAL] error conditions are added.

6227 **NAME**

6228 chdir — change working directory

6229 **SYNOPSIS**

6230 ```
#include <unistd.h>
```

6231 ```
int chdir(const char *path);
```

6232 **DESCRIPTION**

6233 The *chdir*( ) function shall cause the directory named by the path name pointed to by the *path*
6234 argument to become the current working directory; that is, the starting point for path searches
6235 for path names not beginning with `'/'`.

6236 **RETURN VALUE**

6237 Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned, the current
6238 working directory shall remain unchanged, and *errno* shall be set to indicate the error.

6239 **ERRORS**

6240 The *chdir*( ) function shall fail if:

6241 [EACCES] Search permission is denied for any component of the path name.

6242 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
6243 argument.

6244 [ENAMETOOLONG]
6245 The length of the *path* argument exceeds {PATH_MAX} or a path name
6246 component is longer than {NAME_MAX}.

6247 [ENOENT] A component of *path* does not name an existing directory or *path* is an empty
6248 string.

6249 [ENOTDIR] A component of the path name is not a directory.

6250 The *chdir*( ) function may fail if:

6251 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
6252 resolution of the *path* argument.

6253 [ENAMETOOLONG]
6254 As a result of encountering a symbolic link in resolution of the *path* argument,
6255 the length of the substituted path name string exceeded {PATH_MAX}.

6256 **EXAMPLES**

6257 **Changing the Current Working Directory**

6258 The following example makes the value pointed to by **directory**, **/tmp**, the current working
6259 directory.

6260 ```
#include <unistd.h>
```

6261 ```
...
```

6262 ```
char *directory = "/tmp";
```

6263 ```
int ret;
```

6264 ```
ret = chdir (directory);
```
```

APPLICATION USAGE

The *chdir*( ) function only affects the working directory of the current process. The result if a NULL argument is passed to *chdir*( ) is unspecified because some implementations dynamically allocate space in that case.

RATIONALE

The *chdir*( ) function only affects the working directory of the current process.

The result if a NULL argument is passed to *chdir*( ) is left implementation-defined because some implementations dynamically allocate space in that case.

FUTURE DIRECTIONS

None.

SEE ALSO

getcwd( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The **<unistd.h>** header is added to the SYNOPSIS section.

The following change is incorporated for alignment with the ISO POSIX-1 standard:

- The type of argument *path* is changed from **char*** to **const char***.

The following change is incorporated for alignment with the FIPS requirements:

- In the ERRORS section, the condition whereby [ENAMETOOLONG] is returned if a path name component is larger that {NAME_MAX} is now defined as mandatory and marked as an extension.

Issue 4, Version 2

The ERRORS section is updated for X/OPEN UNIX conformance as follows:

- It states that [ELOOP] is returned if too many symbolic links are encountered during path name resolution.
- A second [ENAMETOOLONG] condition is defined that may report excessive length of an intermediate result of path name resolution of a symbolic link.

Issue 6

The APPLICATION USAGE section is added.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The [ENAMETOOLONG] error is restored as an error dependent on _POSIX_NO_TRUNC. This is since behavior may vary from one file system to another.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

6304 **NAME**

6305 chmod — change mode of a file

6306 **SYNOPSIS**

6307 `#include <sys/stat.h>`

6308 `int chmod(const char *`*`path`*`, mode_t `*`mode`*`);`

6309 **DESCRIPTION**

6310 XSI The *chmod*( ) function shall change S_ISUID, S_ISGID, S_ISVTX, and the file permission bits of
6311 the file named by the path name pointed to by the *path* argument to the corresponding bits in the
6312 *mode* argument. The application shall ensure that the effective user ID of the process matches the
6313 owner of the file or the process has appropriate privileges in order to do this.

6314 S_ISUID, S_ISGID, and the file permission bits are described in **<sys/stat.h>**.

6315 XSI If a directory is writable and the mode bit S_ISVTX is set on the directory, a process may remove
6316 or rename files within that directory only if one or more of the following is true:

6317 • The effective user ID of the process is the same as that of the owner ID of the file.

6318 • The effective user ID of the process is the same as that of the owner ID of the directory.

6319 • The process has appropriate privileges.

6320

6321 XSI If the S_ISVTX bit is set on a non-directory file, the behavior is unspecified.

6322 If the calling process does not have appropriate privileges, and if the group ID of the file does
6323 not match the effective group ID or one of the supplementary group IDs and if the file is a
6324 regular file, bit S_ISGID (set-group-ID on execution) in the file's mode shall be cleared upon
6325 successful return from *chmod*( ).

6326 Additional implementation-defined restrictions may cause the S_ISUID and S_ISGID bits in
6327 *mode* to be ignored.

6328 The effect on file descriptors for files open at the time of a call to *chmod*( ) is implementation-
6329 defined.

6330 Upon successful completion, *chmod*( ) shall mark for update the *st_ctime* field of the file.

6331 **RETURN VALUE**

6332 Upon successful completion, 0 shall be returned; otherwise, –1 shall be returned and *errno* set to
6333 indicate the error. If –1 is returned, no change to the file mode occurs.

6334 **ERRORS**

6335 The *chmod*( ) function shall fail if:

6336 [EACCES] Search permission is denied on a component of the path prefix.

6337 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
6338 argument.

6339 [ENAMETOOLONG]
6340 The length of the *path* argument exceeds {PATH_MAX} or a path name
6341 component is longer than {NAME_MAX}.

6342 [ENOTDIR] A component of the path prefix is not a directory.

6343 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

6344 [EPERM] The effective user ID does not match the owner of the file and the process
6345 does not have appropriate privileges.

[EROFS] The named file resides on a read-only file system.

The *chmod*( ) function may fail if:

[EINTR] A signal was caught during execution of the function.

[EINVAL] The value of the *mode* argument is invalid.

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
As a result of encountering a symbolic link in resolution of the *path* argument, the length of the substituted path name strings exceeded {PATH_MAX}.

EXAMPLES

Setting Read Permissions for User, Group, and Others

The following example sets read permissions for the owner, group, and others.

```
#include <sys/stat.h>

const char *path;
...
chmod(path, S_IRUSR|S_IRGRP|S_IROTH);
```

Setting Read, Write, and Execute Permissions for the Owner Only

The following example sets read, write, and execute permissions for the owner, and no permissions for group and others.

```
#include <sys/stat.h>

const char *path;
...
chmod(path, S_IRWXU);
```

Setting Different Permissions for Owner, Group, and Other

The following example sets owner permissions for CHANGEFILE to read, write, and execute, group permissions to read and execute, and other permissions to read.

```
#include <sys/stat.h>

#define CHANGEFILE "/etc/myfile"
...
chmod(CHANGEFILE, S_IRWXU|S_IRGRP|S_IXGRP|S_IROTH);
```

Setting and Checking File Permissions

The following example sets the file permission bits for a file named **/home/cnd/mod1**, then calls the *stat*( ) function to verify the permissions.

```
#include <sys/types.h>
#include <sys/stat.h>

int status;
struct stat buffer
...
```

```
chmod("home/cnd/mod1", S_IRWXU|S_IRWXG|S_IROTH|S_IWOTH);
status = stat("home/cnd/mod1", &buffer;);
```

APPLICATION USAGE

In order to ensure that the S_ISUID and S_ISGID bits are set, an application requiring this should use *stat*( ) after a successful *chmod*( ) to verify this.

Any file descriptors currently open by any process on the file could possibly become invalid if the mode of the file is changed to a value which would deny access to that process. One situation where this could occur is on a stateless file system. This behavior will not occur in a conforming environment.

RATIONALE

This volume of IEEE Std. 1003.1-200x specifies that the S_ISGID bit is cleared by *chmod*( ) on a regular file under certain conditions. This is specified on the assumption that regular files may be executed, and the system should prevent users from making executable *setgid*( ) files perform with privileges that the caller does not have. On implementations that support execution of other file types, the S_ISGID bit should be cleared for those file types under the same circumstances.

Implementations that use the S_ISUID bit to indicate some other function (for example, mandatory record locking) on non-executable files need not clear this bit on writing. They should clear the bit for executable files and any other cases where the bit grants special powers to processes that change the file contents. Similar comments apply to the S_ISGID bit.

FUTURE DIRECTIONS

None.

SEE ALSO

chown( ), *mkdir*( ), *mkfifo*( ), *open*( ), *stat*( ), *statvfs*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<sys/stat.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The **<sys/types.h>** header is now marked as optional (OH); this header need not be included on XSI-conformant systems.

The [EINVAL] error is marked as an extension.

The following change is incorporated for alignment with the ISO POSIX-1 standard:

- The type of argument *path* is changed from **char*** to **const char***.

The following change is incorporated for alignment with the FIPS requirements:

- In the ERRORS section, the condition whereby [ENAMETOOLONG] is returned if a path name component is larger that {NAME_MAX} is now defined as mandatory and marked as an extension.

Issue 4, Version 2

The following changes are incorporated for X/OPEN UNIX conformance:

- The DESCRIPTION is updated to describe X/OPEN UNIX functionality relating to permission checks applied when removing or renaming files in a directory having the S_ISVTX bit set.
- In the ERRORS section, the condition whereby [ELOOP] is returned if too many symbolic links are encountered during path name resolution is defined as mandatory, and [EINTR] is

added as an optional error.

- In the ERRORS section, a second [ENAMETOOLONG] condition is defined that may report excessive length of an intermediate result of path name resolution of a symbolic link.

Issue 6

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The [ENAMETOOLONG] error is restored as an error dependent on _POSIX_NO_TRUNC. This is since behavior may vary from one file system to another.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [EINVAL] and [EINTR] optional error conditions are added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

NAME

chown — change owner and group of a file

SYNOPSIS

```
#include <unistd.h>

int chown(const char *path, uid_t owner, gid_t group);
```

DESCRIPTION

The *path* argument points to a path name naming a file. The user ID and group ID of the named file are set to the numeric values contained in *owner* and *group*, respectively.

Only processes with an effective user ID equal to the user ID of the file or with appropriate privileges may change the ownership of a file. If _POSIX_CHOWN_RESTRICTED is in effect for *path*:

- Changing the user ID is restricted to processes with appropriate privileges.
- Changing the group ID is permitted to a process with an effective user ID equal to the user ID of the file, but without appropriate privileges, if and only if *owner* is equal to the file's user ID or (**uid_t**)–1 and *group* is equal either to the calling process' effective group ID or to one of its supplementary group IDs.

If the specified file is a regular file, one or more of the S_IXUSR, S_IXGRP, or S_IXOTH bits of the file mode are set, and the process does not have appropriate privileges, the set-user-ID (S_ISUID) and set-group-ID (S_ISGID) bits of the file mode shall be cleared upon successful return from *chown*( ). If the specified file is a regular file, one or more of the S_IXUSR, S_IXGRP, or S_IXOTH bits of the file mode are set, and the process has appropriate privileges, it is | implementation-defined whether the set-user-ID and set-group-ID bits are altered. If the *chown*( ) | function is successfully invoked on a file that is not a regular file and one or more of the S_IXUSR, S_IXGRP, or S_IXOTH bits of the file mode are set, the set-user-ID and set-group-ID bits may be cleared.

If *owner* or *group* is specified as (**uid_t**)–1 or (**gid_t**)–1, respectively, the corresponding ID of the file is unchanged.

Upon successful completion, *chown*( ) shall mark for update the *st_ctime* field of the file.

RETURN VALUE

Upon successful completion, 0 shall be returned; otherwise, –1 shall be returned and *errno* set to indicate the error. If –1 is returned, no changes are made in the user ID and group ID of the file.

ERRORS

The *chown*( ) function shall fail if:

[EACCES] Search permission is denied on a component of the path prefix. |

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* | argument.

[ENAMETOOLONG] |
The length of the *path* argument exceeds {PATH_MAX} or a path name component is longer than {NAME_MAX}. |

[ENOTDIR] A component of the path prefix is not a directory. |

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string. |

[EPERM] The effective user ID does not match the owner of the file, or the calling | process does not have appropriate privileges and _POSIX_CHOWN_RESTRICTED indicates that such privilege is required.

[EROFS] The named file resides on a read-only file system.

The *chown*( ) function may fail if:

[EIO] An I/O error occurred while reading or writing to the file system.

[EINTR] The *chown*( ) function was interrupted by a signal which was caught.

[EINVAL] The owner or group ID supplied is not a value supported by the implementation.

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
As a result of encountering a symbolic link in resolution of the *path* argument, the length of the substituted path name string exceeded {PATH_MAX}.

EXAMPLES

None.

APPLICATION USAGE

Although *chown*( ) can be used on some systems by the file owner to change the owner and group to any desired values, the only portable use of this function is to change the group of a file to the effective GID of the calling process or to a member of its group set.

RATIONALE

System III and System V allow a user to give away files; that is, the owner of a file may change its user ID to anything. This is a serious problem for implementations that are intended to meet government security regulations. Version 7 and 4.3 BSD permit only the superuser to change the user ID of a file. Some government agencies (usually not ones concerned directly with security) find this limitation too confining. This volume of IEEE Std. 1003.1-200x uses *may* to permit secure implementations while not disallowing System V.

System III and System V allow the owner of a file to change the group ID to anything. Version 7 permits only the superuser to change the group ID of a file. 4.3 BSD permits the owner to change the group ID of a file to its effective group ID or to any of the groups in the list of supplementary group IDs, but to no others.

The POSIX.1-1990 standard requires that the *chown*( ) function invoked by a non-appropriate privileged process clear the S_ISGID and the S_ISUID bits for regular files, and permits them to be cleared for other types of files. This is so that changes in accessibility do not accidentally cause files to become security holes. Unfortunately, requiring these bits to be cleared on non-executable data files also clears the mandatory file locking bit (shared withwith S_ISGID), which is an extension on many implementations (it first appeared in System V). These bits should only be required to be cleared on regular files that have one or more of their execute bits set.

FUTURE DIRECTIONS

None.

SEE ALSO

chmod( ), *pathconf*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<sys/types.h>**, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The **<sys/types.h>** header is now marked as optional (OH); this header need not be included on XSI-conformant systems.

The value for *owner* of (**uid_t**)–1 is added to the DESCRIPTION to allow the use of –1 by the owner of a file to change the group ID only.

The APPLICATION USAGE section is added.

The following change is incorporated for alignment with the ISO POSIX-1 standard:

- The type of argument *path* is changed from **char*** to **const char***.

The following changes are incorporated for alignment with the FIPS requirements:

- In the ERRORS section, the condition whereby [ENAMETOOLONG] is returned if a path name component is larger that {NAME_MAX} is now defined as mandatory and marked as an extension.
- In the ERRORS section, the condition whereby [EPERM] is returned when an attempt is made to change the user ID of a file and the caller does not have appropriate privileges is now defined as mandatory and marked as an extension.

Issue 4, Version 2

The ERRORS section is updated for X/OPEN UNIX conformance as follows:

- It states that [ELOOP] is returned if too many symbolic links are encountered during path name resolution.
- The [EIO] and [EINTR] optional conditions are added.
- A second [ENAMETOOLONG] condition is defined that may report excessive length of an intermediate result of path name resolution of a symbolic link.

Issue 6

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The wording describing the optional dependency on _POSIX_CHOWN_RESTRICTED is restored.
- The [ENAMETOOLONG] error is restored as an error dependent on _POSIX_NO_TRUNC. This is since behavior may vary from one file system to another.
- The [EPERM] error is restored as an error dependent on _POSIX_CHOWN_RESTRICTED. This is since its operand is a path name and applications should be aware that the error may not occur for that path name if the file system does not support _POSIX_CHOWN_RESTRICTED.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The value for *owner* of (**uid_t**)–1 allows the use of –1 by the owner of a file to change the group ID only.
- The [ELOOP] mandatory error condition is added.
- The [EIO] and [EINTR] optional error conditions are added.

- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Clarification is added that the S_ISUID and S_ISGID bits do not need to be cleared when the process has appropriate privileges.
- The [ELOOP] optional error condition is added.

NAME

cimag, cimagf, cimagl — complex imaginary functions

SYNOPSIS

```
#include <complex.h>

double cimag(double complex z);
float cimagf(float complex z);
long double cimagl(long double complex z);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

These functions shall compute the imaginary part of *z*.

RETURN VALUE

These functions shall return the imaginary part value (as a real).

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

For a variable *z* of complex type:

```
z == creal(z) + cimag(z)*I
```

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

carg( ), *conj*( ), *cproj*( ), *creal*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<complex.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the ISO / IEC 9899: 1999 standard.

NAME

clearerr — clear indicators on a stream

SYNOPSIS

```
#include <stdio.h>

void clearerr(FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

The *clearerr*( ) function shall clear the end-of-file and error indicators for the stream to which *stream* points.

RETURN VALUE

The *clearerr*( ) function shall return no value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The Base Definitions volume of IEEE Std. 1003.1-200x, **<stdio.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

6633 **NAME**

6634 clock — report CPU time used

6635 **SYNOPSIS**

6636 `#include <time.h>`

6637 `clock_t clock(void);`

6638 **DESCRIPTION**

6639 CX The functionality described on this reference page is aligned with the ISO C standard. Any
6640 conflict between the requirements described here and the ISO C standard is unintentional. This
6641 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

6642 The *clock*( ) function shall return the implementation's best approximation to the processor time
6643 used by the process since the beginning of an implementation-defined time related only to the
6644 process invocation.

6645 **RETURN VALUE**

6646 To determine the time in seconds, the value returned by *clock*( ) should be divided by the value
6647 XSI of the macro CLOCKS_PER_SEC. CLOCKS_PER_SEC is defined to be one million in **<time.h>**.
6648 If the processor time used is not available or its value cannot be represented, the function shall
6649 return the value (**clock_t**)–1.

6650 **ERRORS**

6651 No errors are defined.

6652 **EXAMPLES**

6653 None.

6654 **APPLICATION USAGE**

6655 In order to measure the time spent in a program, *clock*( ) should be called at the start of the
6656 program and its return value subtracted from the value returned by subsequent calls. The value
6657 returned by *clock*( ) is defined for compatibility across systems that have clocks with different
6658 resolutions. The resolution on any particular system need not be to microsecond accuracy.

6659 The value returned by *clock*( ) may wrap around on some systems. For example, on a machine
6660 with 32-bit values for **clock_t**, it wraps after 2 147 seconds or 36 minutes.

6661 **RATIONALE**

6662 None.

6663 **FUTURE DIRECTIONS**

6664 None.

6665 **SEE ALSO**

6666 *asctime*( ), *ctime*( ), *difftime*( ), *gmtime*( ), *localtime*( ), *mktime*( ), *strftime*( ), *strptime*( ), *time*( ), *utime*( ),
6667 the Base Definitions volume of IEEE Std. 1003.1-200x, **<time.h>**

6668 **CHANGE HISTORY**

6669 First released in Issue 1. Derived from Issue 1 of the SVID.

6670 **Issue 4**

6671 Reference to the resolution of CLOCKS_PER_SEC is marked as an extension.

6672 The ERRORS section is added.

6673 Advice on how to calculate the time spent in a program is added to the APPLICATION USAGE
6674 section.

6675 The following changes are incorporated for alignment with the ISO C standard:

- The **<time.h>** header is added to the SYNOPSIS section.
- The DESCRIPTION and RETURN VALUE sections, though functionally equivalent to Issue 3, are rewritten for clarity and consistency with the ISO C standard. This issue also defines under what circumstances (**clock_t**)–1 can be returned by the function.
- The function is no longer marked as an extension.

NAME

clock_getcpuclockid — access a process CPU-time clock (**REALTIME**)

SYNOPSIS

CPT
```
#include <time.h>

int clock_getcpuclockid(pid_t pid, clockid_t *clock_id);
```

DESCRIPTION

The *clock_getcpuclockid*( ) function shall return the clock ID of the CPU-time clock of the process specified by *pid*. If the process described by *pid* exists and the calling process has permission, the clock ID of this clock shall be returned in *clock_id*.

If *pid* is zero, the *clock_getcpuclockid*( ) function shall return the clock ID of the CPU-time clock of the process making the call, in *clock_id*.

The conditions under which one process has permission to obtain the CPU-time clock ID of other processes are implementation-defined.

RETURN VALUE

Upon successful completion, *clock_getcpuclockid*( ) shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *clock_getcpuclockid*( ) function shall fail if:

[EPERM] The requesting process does not have permission to access the CPU-time clock for the process.

The *clock_getcpuclockid*( ) function may fail if:

[ESRCH] No process can be found corresponding to the process specified by *pid*.

EXAMPLES

None.

APPLICATION USAGE

The *clock_getcpuclockid*( ) function is part of the Process CPU-Time Clocks option and need not be provided on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

clock_getres( ), *timer_create*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<time.h>**

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std. 1003.1d-1999.

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

NAME

clock_getres, clock_gettime, clock_settime — clock and timer functions (**REALTIME**)

SYNOPSIS

TMR
```
#include <time.h>

int clock_getres(clockid_t clock_id, struct timespec *res);
int clock_settime(clockid_t clock_id, const struct timespec *tp);
int clock_gettime(clockid_t clock_id, struct timespec *tp);
```

DESCRIPTION

The resolution of any clock can be obtained by calling *clock_getres*( ). Clock resolutions are implementation-defined and cannot be set by a process. If the argument *res* is not NULL, the resolution of the specified clock shall be stored in the location pointed to by *res*. If *res* is NULL, the clock resolution is not returned. If the *time* argument of *clock_settime*( ) is not a multiple of *res*, then the value is truncated to a multiple of *res*.

The *clock_gettime*( ) function shall return the current value *tp* for the specified clock, *clock_id*.

The *clock_settime*( ) function shall set the specified clock, *clock_id*, to the value specified by *tp*. Time values that are between two consecutive non-negative integer multiples of the resolution of the specified clock are truncated down to the smaller multiple of the resolution.

A clock may be system-wide (that is, visible to all processes) or per-process (measuring time that is meaningful only within a process). All implementations shall support a *clock_id* of CLOCK_REALTIME defined in **<time.h>**. This clock represents the realtime clock for the system. For this clock, the values returned by *clock_gettime*( ) and specified by *clock_settime*( ) represent the amount of time (in seconds and nanoseconds) since the Epoch. An implementation may also support additional clocks. The interpretation of time values for these clocks is unspecified.

If the value of the CLOCK_REALTIME clock is set via *clock_settime*( ), the new value of the clock shall be used to determine the time of expiration for absolute time services based upon the CLOCK_REALTIME clock. This applies to the time at which armed absolute timers expire. If the absolute time requested at the invocation of such a time service is before the new value of the clock, the time service shall expire immediately as if the clock had reached the requested time normally.

Setting the value of the CLOCK_REALTIME clock via *clock_settime*( ) shall have no effect on threads that are blocked waiting for a relative time service based upon this clock, including the *nanosleep*( ) function; nor on the expiration of relative timers based upon this clock. Consequently, these time services shall expire when the requested relative interval elapses, independently of the new or old value of the clock.

MON If the Monotonic Clock option is supported, all implementations shall support a *clock_id* of CLOCK_MONOTONIC defined in **<time.h>**. This clock represents the monotonic clock for the system. For this clock, the value returned by *clock_gettime*( ) represents the amount of time (in seconds and nanoseconds) since an unspecified point in the past (for example, system start-up time, or the Epoch). This point does not change after system start-up time. The value of the CLOCK_MONOTONIC clock cannot be set via *clock_settime*( ). This function shall fail if it is invoked with a *clock_id* argument of CLOCK_MONOTONIC.

The effect of setting a clock via *clock_settime*( ) on armed per-process timers associated with a clock other than CLOCK_REALTIME is implementation-defined.

CS If the value of the CLOCK_REALTIME clock is set via *clock_settime*( ), the new value of the clock shall be used to determine the time at which the system shall awaken a thread blocked on an

absolute *clock_nanosleep*( ) call based upon the CLOCK_REALTIME clock. If the absolute time requested at the invocation of such a time service is before the new value of the clock, the call shall return immediately as if the clock had reached the requested time normally.

Setting the value of the CLOCK_REALTIME clock via *clock_settime*( ) shall have no effect on any thread that is blocked on a relative *clock_nanosleep*( ) call. Consequently, the call shall return when the requested relative interval elapses, independently of the new or old value of the clock.

The appropriate privilege to set a particular clock is implementation-defined.

CPT If _POSIX_CPUTIME is defined, implementations shall support clock ID values obtained by invoking *clock_getcpuclockid*( ), which represent the CPU-time clock of a given process. Implementations shall also support the special **clockid_t** value CLOCK_PROCESS_CPUTIME_ID, which represents the CPU-time clock of the calling process when invoking one of the *clock_**( ) or *timer_**( ) functions. For these clock IDs, the values returned by *clock_gettime*( ) and specified by *clock_settime*( ) represent the amount of execution time of the process associated with the clock. Changing the value of a CPU-time clock via *clock_settime*( ) shall have no effect on the behavior of the sporadic server scheduling policy (see **Scheduling Policies** (on page 546)).

TCT If _POSIX_THREAD_CPUTIME is defined, implementations shall support clock ID values obtained by invoking *pthread_getcpuclockid*( ), which represent the CPU-time clock of a given thread. Implementations shall also support the special **clockid_t** value CLOCK_THREAD_CPUTIME_ID, which represents the CPU-time clock of the calling thread when invoking one of the *clock_**( ) or *timer_**( ) functions. For these clock IDs, the values returned by *clock_gettime*( ) and specified by *clock_settime*( ) represent the amount of execution time of the thread associated with the clock. Changing the value of a CPU-time clock via *clock_settime*( ) shall have no effect on the behavior of the sporadic server scheduling policy (see **Scheduling Policies** (on page 546)).

RETURN VALUE

A return value of 0 shall indicate that the call succeeded. A return value of –1 shall indicate that an error occurred, and *errno* shall be set to indicate the error.

ERRORS

The *clock_getres*( ), *clock_gettime*( ), and *clock_settime*( ) functions shall fail if:

[EINVAL] The *clock_id* argument does not specify a known clock.

The *clock_settime*( ) function shall fail if:

[EINVAL] The *tp* argument to *clock_settime*( ) is outside the range for the given clock ID.

[EINVAL] The *tp* argument specified a nanosecond value less than zero or greater than or equal to 1 000 million.

MON [EINVAL] The value of the *clock_id* argument is CLOCK_MONOTONIC.

The *clock_settime*( ) function may fail if:

[EPERM] The requesting process does not have the appropriate privilege to set the specified clock.

EXAMPLES

None.

APPLICATION USAGE

These functions are part of the Timers option and need not be available on all implementations.

Note that the absolute value of the monotonic clock is meaningless (because its origin is arbitrary), and thus there is no need to set it. Furthermore, realtime applications can rely on the fact that the value of this clock is never set and, therefore, that time intervals measured with this clock will not be affected by calls to *clock_settime*( ).

RATIONALE

None.

FUTURE DIRECTIONS

None.

clock_getcpuclockid( ), *clock_nanosleep*( ), *ctime*( ), *mq_timedreceive*( ), *mq_timedsend*( ), *nanosleep*( ), *pthread_mutex_timedlock*( ), *sem_timedwait*( ), *time*( ), *timer_create*( ), *timer_getoverrun*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<time.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Timers option.

The APPLICATION USAGE section is added.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Clarification is added of the effect of resetting the clock resolution.

CPU-time clocks and the *clock_getcpuclockid*( ) function are added for alignment with IEEE Std. 1003.1d-1999.

The following changes are added for alignment with IEEE Std. 1003.1j-2000:

- The DESCRIPTION is updated as follows:
  - The value returned by *clock_gettime*( ) for CLOCK_MONOTONIC is specified.
  - *clock_settime*( ) failing for CLOCK_MONOTONIC is specified.
  - The effects of *clock_settime*( ) on the *clock_nanosleep*( ) function with respect to CLOCK_REALTIME is specified.
- An [EINVAL] error is added to the ERRORS section, indicating that *clock_settime*( ) fails for CLOCK_MONOTONIC.
- The APPLICATION USAGE section notes that the CLOCK_MONOTONIC clock need not and shall not be set by *clock_settime*( ) since the absolute value of the CLOCK_MONOTONIC clock is meaningless.
- The *clock_nanosleep*( ), *mq_timedreceive*( ), *mq_timedsend*( ), *pthread_mutex_timedlock*( ), *sem_timedwait*( ), *timer_create*( ), and *timer_settime*( ) functions are added to the SEE ALSO section.

6844 **NAME**

6845 clock_nanosleep — high resolution sleep with specifiable clock

6846 **SYNOPSIS**

6847 CS
```
#include <time.h>

int clock_nanosleep(clockid_t clock_id, int flags,
    const struct timespec *rqtp, struct timespec *rmtp);
```
6848
6849
6850

6851 **DESCRIPTION**

6852 If the flag TIMER_ABSTIME is not set in the *flags* argument, the *clock_nanosleep*( ) function shall
6853 cause the current thread to be suspended from execution until either the time interval specified
6854 by the *rqtp* argument has elapsed, or a signal is delivered to the calling thread and its action is to
6855 invoke a signal-catching function, or the process is terminated. The clock used to measure the
6856 time shall be the clock specified by *clock_id*.

6857 If the flag TIMER_ABSTIME is set in the *flags* argument, the *clock_nanosleep*( ) function shall
6858 cause the current thread to be suspended from execution until either the time value of the clock
6859 specified by *clock_id* reaches the absolute time specified by the *rqtp* argument, or a signal is
6860 delivered to the calling thread and its action is to invoke a signal-catching function, or the
6861 process is terminated. If, at the time of the call, the time value specified by *rqtp* is less than or
6862 equal to the time value of the specified clock, then *clock_nanosleep*( ) shall return immediately
6863 and the calling process shall not be suspended.

6864 The suspension time caused by this function may be longer than requested because the
6865 argument value is rounded up to an integer multiple of the sleep resolution, or because of the
6866 scheduling of other activity by the system. But, except for the case of being interrupted by a
6867 signal, the suspension time for the relative *clock_nanosleep*( ) function (that is, with the
6868 TIMER_ABSTIME flag not set) shall not be less than the time interval specified by *rqtp*, as
6869 measured by the corresponding clock. The suspension for the absolute *clock_nanosleep*( ) function
6870 (that is, with the TIMER_ABSTIME flag set) shall be in effect at least until the value of the
6871 corresponding clock reaches the absolute time specified by *rqtp*, except for the case of being
6872 interrupted by a signal.

6873 The use of the *clock_nanosleep*( ) function shall have no effect on the action or blockage of any
6874 signal.

6875 The *clock_nanosleep*( ) function shall fail if the *clock_id* argument refers to the CPU-time clock of
6876 the calling thread. It is unspecified if *clock_id* values of other CPU-time clocks are allowed.

6877 **RETURN VALUE**

6878 If the *clock_nanosleep*( ) function returns because the requested time has elapsed, its return value
6879 shall be zero.

6880 If the *clock_nanosleep*( ) function returns because it has been interrupted by a signal, it shall return
6881 the corresponding error value. For the relative *clock_nanosleep*( ) function, if the *rmtp* argument is
6882 non-NULL, the **timespec** structure referenced by it shall be updated to contain the amount of
6883 time remaining in the interval (the requested time minus the time actually slept). If the *rmtp*
6884 argument is NULL, the remaining time is not returned. The absolute *clock_nanosleep*( ) function
6885 has no effect on the structure referenced by *rmtp*.

6886 If *clock_nanosleep*( ) fails, it shall return the corresponding error value.

6887 **ERRORS**

6888 The *clock_nanosleep*( ) function shall fail if:

6889 [EINTR] The *clock_nanosleep*( ) function was interrupted by a signal.

6890 [EINVAL] The *rqtp* argument specified a nanosecond value less than zero or greater than
6891 or equal to 1 000 million; or the TIMER_ABSTIME flag was specified in flags
6892 and the *rqtp* argument is outside the range for the clock specified by *clock_id*;
6893 or the *clock_id* argument does not specify a known clock, or specifies the
6894 CPU-time clock of the calling thread.

6895 [ENOTSUP] The *clock_id* argument specifies a clock for which *clock_nanosleep*( ) is not
6896 supported, such as a CPU-time clock.

6897 **EXAMPLES**

6898 None.

6899 **APPLICATION USAGE**

6900 Calling *clock_nanosleep*( ) with the value TIMER_ABSTIME not set in the *flags* argument and with
6901 a *clock_id* of CLOCK_REALTIME is equivalent to calling *nanosleep*( ) with the same *rqtp* and *rmtp*
6902 arguments.

6903 **RATIONALE**

6904 The *nanosleep*( ) function specifies that the system-wide clock CLOCK_REALTIME is used to
6905 measure the elapsed time for this time service. However, with the introduction of the monotonic
6906 clock CLOCK_MONOTONIC a new relative sleep function is needed to allow an application to
6907 take advantage of the special characteristics of this clock.

6908 There are many applications in which a process needs to be suspended and then activated
6909 multiple times in a periodic way; for example, to poll the status of a non-interrupting device or
6910 to refresh a display device. For these cases, it is known that precise periodic activation cannot be
6911 achieved with a relative *sleep*( ) or *nanosleep*( ) function call. Suppose, for example, a periodic
6912 process that is activated at time $T0$, executes for a while, and then wants to suspend itself until
6913 time $T0+T$, the period being T. If this process wants to use the *nanosleep*( ) function, it must first
6914 call *clock_gettime*( ) to get the current time, then calculate the difference between the current time
6915 and $T0+T$ and, finally, call *nanosleep*( ) using the computed interval. However, the process could
6916 be preempted by a different process between the two function calls, and in this case the interval
6917 computed would be wrong; the process would wake up later than desired. This problem would
6918 not occur with the absolute *clock_nanosleep*( ) function, since only one function call would be
6919 necessary to suspend the process until the desired time. In other cases, however, a relative sleep
6920 is needed, and that is why both functionalities are required.

6921 Although it is possible to implement periodic processes using the timers interface, this
6922 implementation would require the use of signals, and the reservation of some signal numbers. In
6923 this regard, the reasons for including an absolute version of the *clock_nanosleep*( ) function in
6924 IEEE Std. 1003.1-200x are the same as for the inclusion of the relative *nanosleep*( ).

6925 It is also possible to implement precise periodic processes using *pthread_cond_timedwait*( ), in
6926 which an absolute timeout is specified that takes effect if the condition variable involved is
6927 never signaled. However, the use of this interface is unnatural, and involves performing other
6928 operations on mutexes and condition variables that imply an unnecessary overhead.
6929 Furthermore, *pthread_cond_timedwait*( ) is not available in implementations that do not support
6930 threads.

6931 Although the interface of the relative and absolute versions of the new high resolution sleep
6932 service is the same *clock_nanosleep*( ) function, the *rmtp* argument is only used in the relative
6933 sleep. This argument is needed in the relative *clock_nanosleep*( ) function to reissue the function

call if it is interrupted by a signal, but it is not needed in the absolute *clock_nanosleep*( ) function call; if the call is interrupted by a signal, the absolute *clock_nanosleep*( ) function can be invoked again with the same *rqtp* argument used in the interrupted call.

FUTURE DIRECTIONS

None.

NAME

clog, clogf, clogl — complex natural logarithm functions

SYNOPSIS

```
#include <complex.h>

double complex clog(double complex z);
float complex clogf(float complex z);
long double complex clogl(long double complex z);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

These functions shall compute the complex natural (base *e*) logarithm of *z*, with a branch cut along the negative real axis.

RETURN VALUE

These functions shall return the complex natural logarithm value, in the range of a strip mathematically unbounded along the real axis and in the interval [$-i\pi$, $+i\pi$] along the imaginary axis.

ERRORS

No errors are defined.

EXAMPLES

None.

NAME

close — close a file descriptor

SYNOPSIS

```
#include <unistd.h>

int close(int fildes);
```

DESCRIPTION

The *close*( ) function shall deallocate the file descriptor indicated by *fildes*. To deallocate means to make the file descriptor available for return by subsequent calls to *open*( ) or other functions that allocate file descriptors. All outstanding record locks owned by the process on the file associated with the file descriptor shall be removed (that is, unlocked).

If *close*( ) is interrupted by a signal that is to be caught, it shall return –1 with *errno* set to [EINTR] and the state of *fildes* is unspecified. If an I/O error occurred while reading from or writing to the file system during *close*( ), it may return –1 with *errno* set to [EIO]; if this error is returned, the state of *fildes* is unspecified.

When all file descriptors associated with a pipe or FIFO special file are closed, any data remaining in the pipe or FIFO shall be discarded.

When all file descriptors associated with an open file description have been closed the open file description shall be freed.

If the link count of the file is 0, when all file descriptors associated with the file are closed, the space occupied by the file shall be freed and the file shall no longer be accessible.

XSR If a STREAMS-based *fildes* is closed and the calling process was previously registered to receive a SIGPOLL signal for events associated with that STREAM, the calling process shall be unregistered for events associated with the STREAM. The last *close*( ) for a STREAM causes the STREAM associated with *fildes* to be dismantled. If O_NONBLOCK is not set and there have been no signals posted for the STREAM, and if there is data on the module's write queue, *close*( ) waits for an unspecified time (for each module and driver) for any output to drain before dismantling the STREAM. The time delay can be changed via an I_SETCLTIME *ioctl*( ) request. If the O_NONBLOCK flag is set, or if there are any pending signals, *close*( ) does not wait for output to drain, and dismantles the STREAM immediately.

If the implementation supports STREAMS-based pipes, and *fildes* is associated with one end of a pipe, the last *close*( ) causes a hangup to occur on the other end of the pipe. In addition, if the other end of the pipe has been named by *fattach*( ), then the last *close*( ) forces the named end to be detached by *fdetach*( ). If the named end has no open file descriptors associated with it and gets detached, the STREAM associated with that end is also dismantled.

If *fildes* refers to the master side of a pseudo-terminal, and this is the last close, a SIGHUP signal is sent to the process group, if any, for which the slave side of the pseudo-terminal is the controlling terminal. It is unspecified whether closing the master side of the pseudo-terminal flushes all queued input and output.

If *fildes* refers to the slave side of a STREAMS-based pseudo-terminal, a zero-length message may be sent to the master.

AIO When there is an outstanding cancelable asynchronous I/O operation against *fildes* when *close*( ) is called, that I/O operation may be canceled. An I/O operation that is not canceled completes as if the *close*( ) operation had not yet occurred. All operations that are not canceled shall complete as if the *close*( ) blocked until the operations completed. The *close*( ) operation itself need not block awaiting such I/O completion. Whether any I/O operation is canceled, and which I/O operation may be canceled upon *close*( ), is implementation-defined.

MF|SHM If a shared memory object or a memory mapped file remains referenced at the last close (that is, a process has it mapped), then the entire contents of the memory object shall persist until the memory object becomes unreferenced. If this is the last close of a shared memory object or a memory mapped file and the close results in the memory object becoming unreferenced, and the memory object has been unlinked, then the memory object shall be removed.

If *fildes* refers to a socket, *close*( ) shall cause the socket to be destroyed. If the socket is in connection-mode, and the SO_LINGER option is set for the socket with non-zero linger time, and the socket has untransmitted data, then *close*( ) shall block for up to the current linger interval until all data is transmitted.

RETURN VALUE

Upon successful completion, 0 shall be returned; otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *close*( ) function shall fail if:

[EBADF] The *fildes* argument is not a valid file descriptor.

[EINTR] The *close*( ) function was interrupted by a signal.

The *close*( ) function may fail if:

[EIO] An I/O error occurred while reading from or writing to the file system.

EXAMPLES

Reassigning a File Descriptor

The following example closes the file descriptor associated with standard output for the current process, re-assigns standard output to a new file descriptor, and closes the original file descriptor to clean up. This example assumes that the file descriptor 0 (which is the descriptor for standard input) is not closed.

```
#include <unistd.h>
...
int pfd;
...
close(1);
dup(pfd);
close(pfd);
...
```

Incidentally, this is exactly what could be achieved using:

```
dup2(pfd, 1);
close(pfd);
```

Closing a File Descriptor

In the following example, *close*( ) is used to close a file descriptor after an unsuccessful attempt is made to associate that file descriptor with a stream.

```
#include <stdio.h>
#include <unistd.h>
#include <stdlib.h>
```

```
#define LOCKFILE "/etc/ptmp"
...
int pfd;
FILE *fpfd;
...
if ((fpfd = fdopen (pfd, "w")) == NULL) {
    close(pfd);
    unlink(LOCKFILE);
    exit(1);
}
...
```

APPLICATION USAGE

An application that had used the *stdio* routine *fopen*( ) to open a file should use the corresponding *fclose*( ) routine rather than *close*( ). Once a file is closed, the file descriptor no longer exists, since the integer corresponding to it no longer refers to a file.

RATIONALE

The use of interruptible device close routines should be discouraged to avoid problems with the implicit closes of file descriptors by *exec* and *exit*( ). This volume of IEEE Std. 1003.1-200x only intends to permit such behavior by specifying the [EINTR] error condition.

FUTURE DIRECTIONS

None.

SEE ALSO

fattach( ), *fclose*( ), *fdetach*( ), *fopen*( ), *ioctl*( ), *open*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<unistd.h>**, Section 2.6 (on page 539)

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The **<unistd.h>** header is added to the SYNOPSIS section.

Issue 4, Version 2

The following changes are incorporated for X/OPEN UNIX conformance:

- The DESCRIPTION is updated to describe the actions of closing a file descriptor referring to a STREAMS-based file or either side of a pseudo-terminal.
- The ERRORS section describes a condition under which the [EIO] error may be returned.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

Issue 6

The DESCRIPTION related to a STREAMS-based file or pseudo-terminal is marked as part of the XSI STREAMS Option Group.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EIO] error condition is added as an optional error.
- The DESCRIPTION is updated to describe the state of the *fildes* file descriptor as unspecified if an I/O error occurs and an [EIO] error condition is returned.

Text referring to sockets is added to the DESCRIPTION.

The DESCRIPTION is updated for alignment with IEEE Std. 1003.1j-2000 by specifying that shared memory objects and memory mapped files (and not typed memory objects) are the types of memory objects to which the paragraph on last closes applies.

7109 **NAME**

7110 closedir — close a directory stream

7111 **SYNOPSIS**

7112 `#include <dirent.h>`

7113 `int closedir(DIR *dirp);`

7114 **DESCRIPTION**

7115 The *closedir*( ) function shall close the directory stream referred to by the argument *dirp*. Upon
7116 return, the value of *dirp* may no longer point to an accessible object of the type **DIR**. If a file
7117 descriptor is used to implement type **DIR**, that file descriptor shall be closed.

7118 **RETURN VALUE**

7119 Upon successful completion, *closedir*( ) shall return 0; otherwise, –1 shall be returned and *errno*
7120 set to indicate the error.

7121 **ERRORS**

7122 The *closedir*( ) function may fail if:

7123 [EBADF] The *dirp* argument does not refer to an open directory stream. |

7124 [EINTR] The *closedir*( ) function was interrupted by a signal. |

7125 **EXAMPLES**

7126 **Closing a Directory Stream**

7127 The following program fragment demonstrates how the *closedir*( ) function is used.

```
7128 ...
7129     DIR *dir;
7130     struct dirent *dp;
7131 ...
7132     if ((dir = opendir (".")) == NULL) {
7133 ...
7134     }
7135     while ((dp = readdir (dir)) != NULL) {
7136 ...
7137     }
7138     closedir(dir);
7139 ...
```

7140 **APPLICATION USAGE**

CHANGE HISTORY

First released in Issue 2.

Issue 4

The **<sys/types.h>** header is now marked as optional (OH); this header need not be included on XSI-conformant systems.

The [EINTR] error is marked as an extension.

Issue 6

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [EINTR] error condition is added as an optional error condition.

NAME

closelog, openlog, setlogmask, syslog — control system log

SYNOPSIS

XSI

```
#include <syslog.h>

void closelog(void);
void openlog(const char *ident, int logopt, int facility);
int setlogmask(int maskpri);
void syslog(int priority, const char *message, ... /* arguments */);
```

DESCRIPTION

The *syslog*( ) function shall send a message to an implementation-defined logging facility, which may log it in an implementation-defined system log, write it to the system console, forward it to a list of users, or forward it to the logging facility on another host over the network. The logged message shall include a message header and a message body. The message header contains at least a timestamp and a tag string.

The message body is generated from the *message* and following arguments in the same manner as if these were arguments to *printf*( ), except that occurrences of %m in the format string pointed to by the *message* argument are replaced by the error message string associated with the current value of *errno*. A trailing <newline> character is added if needed.

Values of the *priority* argument are formed by OR'ing together a severity level value and an optional facility value. If no facility value is specified, the current default facility value is used.

Possible values of severity level include:

LOG_EMERG — A panic condition.

LOG_ALERT — A condition that should be corrected immediately, such as a corrupted system database.

LOG_CRIT — Critical conditions, such as hard device errors.

LOG_ERR — Errors.

LOG_WARNING — Warning messages.

LOG_NOTICE — Conditions that are not error conditions, but that may require special handling.

LOG_INFO — Informational messages.

LOG_DEBUG — Messages that contain information normally of use only when debugging a program.

The facility indicates the application or system component generating the message. Possible facility values include:

LOG_USER — Messages generated by arbitrary processes. This is the default facility identifier if none is specified.

LOG_LOCAL0 — Reserved for local use.

LOG_LOCAL1 — Reserved for local use.

LOG_LOCAL2 — Reserved for local use.

7203 LOG_LOCAL3 Reserved for local use.

7204 LOG_LOCAL4 Reserved for local use.

7205 LOG_LOCAL5 Reserved for local use.

7206 LOG_LOCAL6 Reserved for local use.

7207 LOG_LOCAL7 Reserved for local use.

7208 The *openlog*( ) function shall set process attributes that affect subsequent calls to *syslog*( ). The
7209 *ident* argument is a string that is prepended to every message. The *logopt* argument indicates
7210 logging options. Values for *logopt* are constructed by a bitwise-inclusive OR of zero or more of
7211 the following:

7212 LOG_PID Log the process ID with each message. This is useful for identifying specific
7213 processes.

7214 LOG_CONS Write messages to the system console if they cannot be sent to the logging
7215 facility. The *syslog*( ) function ensures that the process does not acquire the
7216 console as a controlling terminal in the process of writing the message.

7217 LOG_NDELAY Open the connection to the logging facility immediately. Normally the open is
7218 delayed until the first message is logged. This is useful for programs that need
7219 to manage the order in which file descriptors are allocated.

7220 LOG_ODELAY Delay open until *syslog*( ) is called.

7221 LOG_NOWAIT Do not wait for child processes that may have been created during the course
7222 of logging the message. This option should be used by processes that enable
7223 notification of child termination using SIGCHLD, since *syslog*( ) may
7224 otherwise block waiting for a child whose exit status has already been
7225 collected.

7226 The *facility* argument encodes a default facility to be assigned to all messages that do not have
7227 an explicit facility already encoded. The initial default facility is LOG_USER.

7228 The *openlog*( ) and *syslog*( ) functions may allocate a file descriptor. It is not necessary to call
7229 *openlog*( ) prior to calling *syslog*( ).

7230 The *closelog*( ) function shall close any open file descriptors allocated by previous calls to
7231 *openlog*( ) or *syslog*( ).

7232 The *setlogmask*( ) function shall set the log priority mask for the current process to *maskpri* and
7233 return the previous mask. If the *maskpri* argument is 0, the current log mask is not modified.
7234 Calls by the current process to *syslog*( ) with a priority not set in *maskpri* shall be rejected. The
7235 default log mask allows all priorities to be logged. A call to *openlog*( ) is not required prior to
7236 calling *setlogmask*( ).

7237 Symbolic constants for use as values of the *logopt*, *facility*, *priority*, and *maskpri* arguments are
7238 defined in the **<syslog.h>** header.

7239 **RETURN VALUE**

7240 The *setlogmask*( ) function shall return the previous log priority mask. The *closelog*( ), *openlog*( ),
7241 and *syslog*( ) functions shall return no value.

7242 **ERRORS**

7243 No errors are defined.

EXAMPLES

Using openlog()

The following example causes subsequent calls to *syslog*( ) to log the process ID with each message, and to write messages to the system console if they cannot be sent to the logging facility.

```
#include <syslog.h>

char *ident = "Process demo";
int logopt = LOG_PID | LOG_CONS;
int facility = LOG_USER;
...
openlog(ident, logopt, facility);
```

Using setlogmask()

The following example causes subsequent calls to *syslog*( ) to accept error messages or messages generated by arbitrary processes, and to reject all other messages.

```
#include <syslog.h>

int result;
int mask = LOG_MASK (LOG_ERR | LOG_USER);
...
result = setlogmask(mask);
```

Using syslog

The following example sends the message "This is a message" to the default logging facility, marking the message as an error message generated by random processes.

```
#include <syslog.h>

char *message = "This is a message";
int priority = LOG_ERR | LOG_USER;
...
syslog(priority, message);
```

APPLICATION USAGE

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

7283 **NAME**

7284 confstr — get configurable variables

7285 **SYNOPSIS**

7286 ```
#include <unistd.h>
```

7287 ```
size_t confstr(int name, char *buf, size_t len);
```

7288 **DESCRIPTION**

7289 The *confstr*( ) function provides a method for applications to get configuration-defined string
7290 values. Its use and purpose are similar to *sysconf*( ), but it is used where string values rather than
7291 numeric values are returned.

7292 The *name* argument represents the system variable to be queried. The implementation shall
7293 support the following name values, defined in **<unistd.h>**. It may support others:

7294 _CS_PATH
7295 _CS_POSIX_V6_ILP32_OFF32_CFLAGS
7296 _CS_POSIX_V6_ILP32_OFF32_LDFLAGS
7297 _CS_POSIX_V6_ILP32_OFF32_LIBS
7298 _CS_POSIX_V6_ILP32_OFF32_LINTFLAGS
7299 _CS_POSIX_V6_ILP32_OFFBIG_CFLAGS
7300 _CS_POSIX_V6_ILP32_OFFBIG_LDFLAGS
7301 _CS_POSIX_V6_ILP32_OFFBIG_LIBS
7302 _CS_POSIX_V6_ILP32_OFFBIG_LINTFLAGS
7303 _CS_POSIX_V6_LP64_OFF64_CFLAGS
7304 _CS_POSIX_V6_LP64_OFF64_LDFLAGS
7305 _CS_POSIX_V6_LP64_OFF64_LIBS
7306 _CS_POSIX_V6_LP64_OFF64_LINTFLAGS
7307 _CS_POSIX_V6_LPBIG_OFFBIG_CFLAGS
7308 _CS_POSIX_V6_LPBIG_OFFBIG_LDFLAGS
7309 _CS_POSIX_V6_LPBIG_OFFBIG_LIBS
7310 _CS_POSIX_V6_LPBIG_OFFBIG_LINTFLAGS
7311 XSI _CS_XBS5_ILP32_OFF32_CFLAGS (**LEGACY**)
7312 _CS_XBS5_ILP32_OFF32_LDFLAGS (**LEGACY**)
7313 _CS_XBS5_ILP32_OFF32_LIBS (**LEGACY**)
7314 _CS_XBS5_ILP32_OFF32_LINTFLAGS (**LEGACY**)
7315 _CS_XBS5_ILP32_OFFBIG_CFLAGS (**LEGACY**)
7316 _CS_XBS5_ILP32_OFFBIG_LDFLAGS (**LEGACY**)
7317 _CS_XBS5_ILP32_OFFBIG_LIBS (**LEGACY**)
7318 _CS_XBS5_ILP32_OFFBIG_LINTFLAGS (**LEGACY**)
7319 _CS_XBS5_LP64_OFF64_CFLAGS (**LEGACY**)
7320 _CS_XBS5_LP64_OFF64_LDFLAGS (**LEGACY**)
7321 _CS_XBS5_LP64_OFF64_LIBS (**LEGACY**)
7322 _CS_XBS5_LP64_OFF64_LINTFLAGS (**LEGACY**)
7323 _CS_XBS5_LPBIG_OFFBIG_CFLAGS (**LEGACY**)
7324 _CS_XBS5_LPBIG_OFFBIG_LDFLAGS (**LEGACY**)
7325 _CS_XBS5_LPBIG_OFFBIG_LIBS (**LEGACY**)
7326 _CS_XBS5_LPBIG_OFFBIG_LINTFLAGS (**LEGACY**)
7327

7328 If *len* is not 0, and if *name* has a configuration-defined value, *confstr*( ) shall copy that value into
7329 the *len*-byte buffer pointed to by *buf*. If the string to be returned is longer than *len* bytes,
7330 including the terminating null, then *confstr*( ) shall truncate the string to *len*–1 bytes and null-
7331 terminate the result. The application can detect that the string was truncated by comparing the

value returned by *confstr*( ) with *len*.

If *len* is 0 and *buf* is a null pointer, then *confstr*( ) shall still return the integer value as defined below, but shall not return a string. If *len* is 0 but *buf* is not a null pointer, the result is unspecified.

If the implementation supports the Shell option, the string stored in *buf* after a call to:

```
confstr(_CS_PATH, buf, sizeof(buf))
```

can be used as a value of the *PATH* environment variable that accesses all of the standard utilities of IEEE Std. 1003.1-200x, if the return value is less than or equal to *sizeof*(*buf*).

RETURN VALUE

If *name* has a configuration-defined value, *confstr*( ) shall return the size of buffer that would be needed to hold the entire configuration-defined value including the terminating null. If this return value is greater than *len*, the string returned in *buf* is truncated.

If *name* is invalid, *confstr*( ) shall return 0 and set *errno* to indicate the error.

If *name* does not have a configuration-defined value, *confstr*( ) shall return 0 and leave *errno* unchanged.

ERRORS

The *confstr*( ) function shall fail if:

[EINVAL] The value of the *name* argument is invalid.

EXAMPLES

None.

APPLICATION USAGE

An application can distinguish between an invalid *name* parameter value and one that corresponds to a configurable variable that has no configuration-defined value by checking if *errno* is modified. This mirrors the behavior of *sysconf*( ).

The original need for this function was to provide a way of finding the configuration-defined default value for the environment variable *PATH*. Since *PATH* can be modified by the user to include directories that could contain utilities replacing the standard utilities in the Shell and Utilities volume of IEEE Std. 1003.1-200x, applications need a way to determine the system-supplied *PATH* environment variable value that contains the correct search path for the standard utilities.

An application could use:

```
confstr(name, (char *)NULL, (size_t)0)
```

to find out how big a buffer is needed for the string value; use *malloc*( ) to allocate a buffer to hold the string; and call *confstr*( ) again to get the string. Alternately, it could allocate a fixed, static buffer that is big enough to hold most answers (perhaps 512 or 1 024 bytes), but then use *malloc*( ) to allocate a larger buffer if it finds that this is too small.

RATIONALE

Application developers can normally determine any configuration variable by means of reading from the stream opened by a call to:

```
popen("command -p getconf variable", "r");
```

The *confstr*( ) function with a *name* argument of _CS_PATH returns a string that can be used as a *PATH* environment variable setting that will reference the standard shell and utilities as described in the Shell and Utilities volume of IEEE Std. 1003.1-200x.

The *confstr*( ) function copies the returned string into a buffer supplied by the application instead of returning a pointer to a string. This allows a cleaner function in some implementations (such as those with lightweight threads) and resolves questions about when the application must copy the string returned.

FUTURE DIRECTIONS

None.

SEE ALSO

pathconf( ), *sysconf*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<unistd.h>**, the Shell and Utilities volume of IEEE Std. 1003.1-200x, *c99*

CHANGE HISTORY

First released in Issue 4. Derived from the ISO POSIX-2 standard.

Issue 5

A table indicating the permissible values of *name* are added to the DESCRIPTION. All those marked EX are new in this issue.

Issue 6

The Open Group corrigenda item U033/7 has been applied. The return value for the case returning the size of the buffer now explicitly states that this includes the terminating null.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated with new arguments which can be used to determine configuration strings for C compiler flags, linker/loader flags, and libraries for each different supported programming environment. This is a change to support data size neutrality.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The DESCRIPTION is updated to include text describing how _CS_PATH can be used to obtain a *PATH* to access the standard utilities.

The macros associated with the *c89* programming models are marked LEGACY and new equivalent macros associated with *c99* are introduced.

NAME

conj, conjf, conjl — complex conjugate functions

SYNOPSIS

```
#include <complex.h>

double complex conj(double complex z);
float complex conjf(float complex z);
long double complex conjl(long double complex z);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

These functions shall compute the complex conjugate of *z*, by reversing the sign of its imaginary part.

RETURN VALUE

These functions return the complex conjugate value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

CHANGE HISTORY

First released in Issue 6. Derived from the ISO / IEC 9899: 1999 standard.

7432 **NAME**

7433 connect — connect a socket

7434 **SYNOPSIS**

7435 ```
#include <sys/socket.h>
```

7436 ```
int connect(int socket, const struct sockaddr *address,
```

7437 ```
    socklen_t address_len);
```

7438 **DESCRIPTION**

7439 The *connect*( ) function requests a connection to be made on a socket. The function takes the
7440 following arguments:

7441 *socket* Specifies the file descriptor associated with the socket.

7442 *address* Points to a **sockaddr** structure containing the peer address. The length and
7443 format of the address depend on the address family of the socket.

7444 *address_len* Specifies the length of the **sockaddr** structure pointed to by the *address*
7445 argument.

7446 If the socket has not already been bound to a local address, *connect*( ) shall bind it to an address
7447 which, unless the socket's address family is AF_UNIX, is an unused local address.

7448 If the initiating socket is not connection-mode, then *connect*( ) shall set the socket's peer address,
7449 and no connection is made. For SOCK_DGRAM sockets, the peer address identifies where all
7450 datagrams are sent on subsequent *send*( ) functions, and limits the remote sender for subsequent
7451 *recv*( ) functions. If *address* is a null address for the protocol, the socket's peer address shall be
7452 reset.

7453 If the initiating socket is connection-mode, then *connect*( ) attempts to establish a connection to
7454 the address specified by the *address* argument.

7455 If the connection cannot be established immediately and O_NONBLOCK is not set for the file
7456 descriptor for the socket, *connect*( ) shall block for up to an unspecified timeout interval until the
7457 connection is established. If the timeout interval expires before the connection is established,
7458 *connect*( ) shall fail and the connection attempt shall be aborted. If *connect*( ) is interrupted by a
7459 signal that is caught while blocked waiting to establish a connection, *connect*( ) shall fail and set
7460 *errno* to [EINTR], but the connection request shall not be aborted, and the connection shall be
7461 established asynchronously.

7462 If the connection cannot be established immediately and O_NONBLOCK is set for the file
7463 descriptor for the socket, *connect*( ) shall fail and set *errno* to [EINPROGRESS], but the connection
7464 request shall not be aborted, and the connection shall be established asynchronously.
7465 Subsequent calls to *connect*( ) for the same socket, before the connection is established, shall fail
7466 and set *errno* to [EALREADY].

7467 When the connection has been established asynchronously, *select*( ) and *poll*( ) shall indicate that
7468 the file descriptor for the socket is ready for writing.

7469 The socket in use may require the process to have appropriate privileges to use the *connect*( )
7470 function.

7471 **RETURN VALUE**

7472 Upon successful completion, *connect*( ) shall return 0; otherwise, –1 shall be returned and *errno*
7473 set to indicate the error.
```

ERRORS

The *connect*( ) function shall fail if:

[EADDRNOTAVAIL]
The specified address is not available from the local machine.

[EAFNOSUPPORT]
The specified address is not a valid address for the address family of the specified socket.

[EALREADY] A connection request is already in progress for the specified socket.

[EBADF] The *socket* argument is not a valid file descriptor.

[ECONNREFUSED]
The target address was not listening for connections or refused the connection request.

[EINPROGRESS] O_NONBLOCK is set for the file descriptor for the socket and the connection cannot be immediately established; the connection shall be established asynchronously.

[EINTR] The attempt to establish a connection was interrupted by delivery of a signal that was caught; the connection shall be established asynchronously.

[EISCONN] The specified socket is connection-mode and is already connected.

[ENETUNREACH]
No route to the network is present.

[ENOTSOCK] The *socket* argument does not refer to a socket.

[EPROTOTYPE] The specified address has a different type than the socket bound to the specified peer address.

[ETIMEDOUT] The attempt to connect timed out before a connection was made.

If the address family of the socket is AF_UNIX, then *connect*( ) shall fail if:

[EIO] An I/O error occurred while reading from or writing to the file system.

[ELOOP] A loop exists in symbolic links encountered during resolution of the path name in *address*.

[ENAMETOOLONG]
A component of a path name exceeded {NAME_MAX} characters, or an entire path name exceeded {PATH_MAX} characters.

[ENOENT] A component of the path name does not name an existing file or the path name is an empty string.

[ENOTDIR] A component of the path prefix of the path name in *address* is not a directory.

The *connect*( ) function may fail if:

[EACCES] Search permission is denied for a component of the path prefix; or write access to the named socket is denied.

[EADDRINUSE] Attempt to establish a connection that uses addresses that are already in use.

[ECONNRESET] Remote host reset the connection request.

[EHOSTUNREACH]
The destination host cannot be reached (probably because the host is down or

a remote router cannot reach it).

[EINVAL] The *address_len* argument is not a valid length for the address family; or invalid address family in the **sockaddr** structure.

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the path name in *address*.

[ENAMETOOLONG] Path name resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}.

[ENETDOWN] The local network interface used to reach the destination is down.

[ENOBUFS] No buffer space is available.

[EOPNOTSUPP] The socket is listening and cannot be connected.

EXAMPLES

None.

APPLICATION USAGE

If *connect*( ) fails, the state of the socket is unspecified. Portable applications should close the file descriptor and create a new socket before attempting to reconnect.

RATIONALE

None.

FUTURE DIRECTIONS

None.

accept( ), *bind*( ), *close*( ), *getsockname*( ), *poll*( ), *select*( ), *send*( ), *shutdown*( ), *socket*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<sys/socket.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

NAME

copysign, copysignf, copysignl — number manipulation function

SYNOPSIS

```
#include <math.h>

double copysign(double x, double y);
float copysignf(float x, float y);
long double copysignl(long double x, long double y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

These functions shall produce a value with the magnitude of *x* and the sign of *y*. They produce a NaN (with the sign of *y*) if *x* is a NaN. On implementations that represent a signed zero but do not treat negative zero consistently in arithmetic operations, these functions regard the sign of zero as positive.

An application wishing to check for error situations should set *errno* to 0 before calling these functions. If *errno* is non-zero on return, or the return value is NaN, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return a value with the magnitude of *x* and the sign of *y*.

If *x* is ±Inf, these functions shall return *x*.

If *x* is NaN, NaN shall be returned and *errno* may be set to [EDOM].

ERRORS

These functions may fail if:

[EDOM] The value of *x* is NaN.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

copysign( ) and *signbit*( ) need not be consistent with each other if the arithmetic is not consistent in its treatment of zeros. For example, the IBM S/370 has instructions to flip the sign bit making it possible to create a negative zero, but ±0.0 x ±1.0 is always +0.0. In this case, *copysign*( ) will treat 0.0 as positive, while *signbit*( ) will treat it as negative.

FUTURE DIRECTIONS

None.

SEE ALSO

signbit( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<math.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

NAME

cos, cosf, cosl — cosine function

SYNOPSIS

```
#include <math.h>

double cos(double x);
float cosf(float x);
long double cosl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

These functions shall compute the cosine of *x*, measured in radians.

An application wishing to check for error situations should set *errno* to 0 before calling *cos*(). If *errno* is non-zero on return, or the returned value is NaN, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the cosine of *x*.

XSI If *x* is NaN, NaN shall be returned and *errno* may be set to [EDOM].

XSI If *x* is ±Inf, either 0 shall be returned and *errno* set to [EDOM], or NaN shall be returned and *errno* may be set to [EDOM].

If the result underflows, 0 shall be returned and *errno* may be set to [ERANGE].

ERRORS

These functions may fail if:

XSI [EDOM] The value of *x* is NaN or *x* is ±Inf.

[ERANGE] The result underflows

XSI No other errors shall occur.

EXAMPLES

Taking the Cosine of a 45-Degree Angle

```
#include <math.h>
...
double radians = 45 * M_PI / 180;
double result;
...
result = cos(radians);
```

APPLICATION USAGE

The *cos*() function may lose accuracy when its argument is far from 0.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

References to *matherr*( ) are removed.

The RETURN VALUE and ERRORS sections are substantially rewritten for alignment with the ISO C standard and to rationalize error handling in the mathematics functions.

The return value specified for [EDOM] is marked as an extension.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *cosf*( ) and *cosl*( ) functions are added for alignment with the ISO / IEC 9899: 1999 standard.

7635 **NAME**

7636 cosh, coshf, coshl — hyperbolic cosine function

7637 **SYNOPSIS**

7638
```
#include <math.h>
```

7639
```
double cosh(double x);
```
7640
```
float coshf(float x);
```
7641
```
long double coshl(long double x);
```

7642 **DESCRIPTION**

7643 CX The functionality described on this reference page is aligned with the ISO C standard. Any
7644 conflict between the requirements described here and the ISO C standard is unintentional. This
7645 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

7646 These functions shall compute the hyperbolic cosine of *x*.

7647 An application wishing to check for error situations should set *errno* to 0 before calling *cosh*( ). If
7648 *errno* is non-zero on return, or the returned value is NaN, an error has occurred.

7649 **RETURN VALUE**

7650 Upon successful completion, these functions shall return the hyperbolic cosine of *x*.

7651 If the result would cause an overflow, HUGE_VAL shall be returned and *errno* set to [ERANGE].

7652 XSI If *x* is NaN, NaN shall be returned and *errno* may be set to [EDOM].

7653 **ERRORS**

7654 These functions shall fail if:

7655 [ERANGE] The result would cause an overflow.

7656 These functions may fail if:

7657 XSI [EDOM] The value of *x* is NaN.

7658 XSI No other errors shall occur.

7659 **EXAMPLES**

NAME

cproj, cprojf, cprojl — complex projection functions

SYNOPSIS

```
#include <complex.h>

double complex cproj(double complex z);
float complex cprojf(float complex z);
long double complex cprojl(long double complex z);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

These functions shall compute a projection of *z* onto the Riemann sphere: *z* projects to *z*, except that all complex infinities (even those with one infinite part and one NaN part) project to positive infinity on the real axis. If *z* has an infinite part, then *cproj*(*z*) is equivalent to:

```
INFINITY + I * copysign(0.0, cimag(z))
```

RETURN VALUE

These functions shall return the value of the projection onto the Riemann sphere.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Two topologies are commonly used in complex mathematics: the complex plane with its continuum of infinities, and the Riemann sphere with its single infinity. The complex plane is better suited for transcendental functions, the Riemann sphere for algebraic functions. The complex types with their multiplicity of infinities provide a useful (though imperfect) model for the complex plane. The *cproj*( ) function helps model the Riemann sphere by mapping all infinities to one, and should be used just before any operation, especially comparisons, that might give spurious results for any of the other infinities. Note that a complex value with one infinite part and one NaN part is regarded as an infinity, not a NaN, because if one part is infinite, the complex value is infinite independent of the value of the other part. For the same reason, *cabs*( ) returns an infinity if its argument has an infinite part and a NaN part.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 6. Derived from the ISO / IEC 9899: 1999 standard.

NAME

creal, crealf, creall — complex real functions

SYNOPSIS

```
#include <complex.h>

double creal(double complex z);
float crealf(float complex z);
long double creall(long double complex z);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

These functions shall compute the real part of *z*.

RETURN VALUE

These functions shall return the real part value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

For a variable *z* of complex type:

```
z == creal(z) + cimag(z)*I
```

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 6. Derived from the ISO / IEC 9899: 1999 standard.

NAME

creat — create a new file or rewrite an existing one

SYNOPSIS

OH
```
#include <sys/stat.h>
#include <fcntl.h>

int creat(const char *path, mode_t mode);
```

DESCRIPTION

The function call:

```
creat(path, mode)
```

is equivalent to:

```
open(path, O_WRONLY|O_CREAT|O_TRUNC, mode)
```

RETURN VALUE

Refer to *open*( ).

ERRORS

Refer to *open*( ).

EXAMPLES

Creating a File

The following example creates the file **/tmp/file** with read and write permissions for the file owner and read permission for group and others. The resulting file descriptor is assigned to the *fd* variable.

```
#include <fcntl.h>
...
int fd;
mode_t mode = S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH;
char *filename = "/tmp/file";
...
fd = creat(filename, mode);
...
```

APPLICATION USAGE

None.

RATIONALE

The *creat*( ) function is redundant. Its services are also provided by the *open*( ) function. It has been included primarily for historical purposes since many existing applications depend on it. It is best considered a part of the C binding rather than a function that should be provided in other languages.

FUTURE DIRECTIONS

None.

SEE ALSO

open( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<fcntl.h>**, **<sys/stat.h>**, | **<sys/types.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The **<sys/types.h>** and **<sys/stat.h>** headers are now marked as optional (OH); these headers need not be included on XSI-conformant systems.

The following change is incorporated for alignment with the ISO POSIX-1 standard:

- The type of argument *path* is changed from **char*** to **const char***.

Issue 6

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

NAME

crypt — string encoding function (**CRYPT**)

SYNOPSIS

XSI

```
#include <unistd.h>

char *crypt(const char *key, const char *salt);
```

DESCRIPTION

The *crypt*( ) function is a string encoding function. The algorithm is implementation-defined.

The *key* argument points to a string to be encoded. The *salt* argument is a string chosen from the set:

```
a b c d e f g h i j k l m n o p q r s t u v w x y z
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
0 1 2 3 4 5 6 7 8 9 . /
```

The first two characters of this string may be used to perturb the encoding algorithm.

The return value of *crypt*( ) points to static data that is overwritten by each call.

The *crypt*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

Upon successful completion, *crypt*( ) shall return a pointer to the encoded string. The first two characters of the returned value are those of the *salt* argument. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

ERRORS

The *crypt*( ) function shall fail if:

[ENOSYS] The functionality is not supported on this implementation.

EXAMPLES

Encoding Passwords

The following example finds a user database entry matching a particular user name and changes the current password to a new password. The *crypt*( ) function is used to generate an encoded version of each password. The first call to *crypt*( ) produces an encoded version of the old password; that encoded password is then compared to the password stored in the user database. The second call to *crypt*( ) encodes the new password before it is stored.

The *putpwent*( ) function, used in the following example, is not part of IEEE Std. 1003.1-200x.

```
#include <unistd.h>
#include <pwd.h>
#include <string.h>
#include <stdio.h>
...
int valid_change;
int pfd;  /* Integer for file descriptor returned by open(). */
FILE *fpfd;  /* File pointer for use in putpwent(). */
struct passwd *p;
char user[100];
char oldpasswd[100];
char newpasswd[100];
```

```
        char savepasswd[100];
        ...
        valid_change = 0;
        while ((p = getpwent()) != NULL) {
            /* Change entry if found. */
            if (strcmp(p->pw_name, user) == 0) {
                if (strcmp(p->pw_passwd, crypt(oldpasswd, p->pw_passwd)) == 0) {
                    strcpy(savepasswd, crypt(newpasswd, user));
                    p->pw_passwd = savepasswd;
                    valid_change = 1;
                }
                else {
                    fprintf(stderr, "Old password is not valid\n");
                }
            }
            /* Put passwd entry into ptmp. */
            putpwent(p, fpfd);
        }
```

APPLICATION USAGE

The values returned by this function need not be portable among XSI-conformant systems.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the ISO / IEC 9899: 1999 standard.

8057 **NAME**

8058 ctermid — generate a path name for controlling terminal

8059 **SYNOPSIS**

8060
```
#include <stdio.h>
```

8061
```
char *ctermid(char *s);
```

8062 **DESCRIPTION**

8063 The *ctermid*( ) function shall generate a string that, when used as a path name, refers to the
8064 current controlling terminal for the current process. If *ctermid*( ) returns a path name, access to
8065 the file is not guaranteed.

8066 If the application uses any of the _POSIX_THREAD_SAFE_FUNCTIONS or _POSIX_THREADS
8067 functions, it shall ensure that the *ctermid*( ) function is called with a non-NULL parameter.

8068 **RETURN VALUE**

8069 If *s* is a null pointer, the string is generated in an area that may be static (and therefore may be
8070 overwritten by each call), the address of which shall be returned. Otherwise, *s* is assumed to |
8071 point to a character array of at least {L_ctermid} bytes; the string is placed in this array and the |
8072 value of *s* shall be returned. The symbolic constant {L_ctermid} is defined in **<stdio.h>**, and shall |
8073 have a value greater than 0.

8074 The *ctermid*( ) function shall return an empty string if the path name that would refer to the
8075 controlling terminal cannot be determined, or if the function is unsuccessful.

8076 **ERRORS**

8077 No errors are defined.

8078 **EXAMPLES**

8079 **Determining the Controlling Terminal for the Current Process**

8080 The following example returns a pointer to a string that identifies the controlling terminal for the
8081 current process. The path name for the terminal is stored in the array pointed to by the *ptr* |
8082 argument, which has a size of {L_ctermid} bytes, as indicated by the *term* argument. |

8083
```
#include <stdio.h>
```
8084
```
...
```
8085
```
char term[L_ctermid];
```
8086
```
char *ptr;
```

8087
```
ptr = ctermid(term);
```

8088 **APPLICATION USAGE**

8089 The difference between *ctermid*( ) and *ttyname*( ) is that *ttyname*( ) must be handed a file
8090 descriptor and return a path of the terminal associated with that file descriptor, while *ctermid*( )
8091 returns a string (such as `"/dev/tty"`) that refers to the current controlling terminal if used as a
8092 path name.

8093 **RATIONALE**

8094 {L_ctermid} must be defined appropriately for a given implementation and must be greater than |
8095 zero so that array declarations using it are accepted by the compiler. The value includes the
8096 terminating null byte.

8097 Portable applications that use threads cannot call *ctermid*( ) with NULL as the parameter if either
8098 _POSIX_THREAD_SAFE_FUNCTIONS or _POSIX_THREADS is defined. If *s* is not NULL, the
8099 *ctermid*( ) function generates a string that, when used as a path name, refers to the current
8100 controlling terminal for the current process. If *s* is NULL, the return value of *ctermid*( ) is

undefined.

If the *ctermid*( ) function returns a path name, access to the file is not guaranteed.

There is no additional burden on the programmer—changing to use a hypothetical thread-safe version of *ctermid*( ) along with allocating a buffer is more of a burden than merely allocating a buffer. Application code should not assume that the returned string is short, as some implementations have more than two path name components before reaching a logical device name.

FUTURE DIRECTIONS

None.

SEE ALSO

ttyname( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdio.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The following change is incorporated for alignment with the ISO POSIX-1 standard:

- The DESCRIPTION and RETURN VALUE sections, though functionally identical to Issue 3, are rewritten.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

NAME

ctime, ctime_r — convert a time value to date and time string

SYNOPSIS

```
#include <time.h>

char *ctime(const time_t *clock);
TSF char *ctime_r(const time_t *clock, char *buf);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

The *ctime*( ) function shall convert the time pointed to by *clock*, representing time in seconds since the Epoch, to local time in the form of a string. It is equivalent to:

```
asctime(localtime(clock))
```

CX The *asctime*( ), *ctime*( ), *gmtime*( ), and *localtime*( ) functions return values in one of two static objects: a broken-down time structure and an array of **char**. Execution of any of the functions may overwrite the information returned in either of these objects by any of the other functions.

The *ctime*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

TSF The *ctime_r*( ) function shall convert the calendar time pointed to by *clock* to local time in exactly the same form as *ctime*( ) and puts the string into the array pointed to by *buf* (which contains at least 26 bytes) and return *buf*.

Unlike *ctime*( ), the thread-safe version *ctime_r*( ) is not required to set *tzname*.

RETURN VALUE

The *ctime*( ) function shall return the pointer returned by *asctime*( ) with that broken-down time as an argument.

TSF Upon successful completion, *ctime_r*( ) shall return a pointer to the string pointed to by *buf*. When an error is encountered, a null pointer shall be returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

Values for the broken-down time structure can be obtained by calling *gmtime*( ) or *localtime*( ). The *ctime*( ) function is included for compatibility with older implementations, and does not support localized date and time formats. Applications should use the *strftime*( ) function to achieve maximum portability.

The *ctime_r*( ) function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

asctime( ), *clock*( ), *difftime*( ), *gmtime*( ), *localtime*( ), *mktime*( ), *strftime*( ), *strptime*( ), *time*( ), *utime*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<time.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The APPLICATION USAGE section is expanded to describe the time-handling functions generally and to refer users to *strftime*( ), which is a locale-dependent time-handling function.

The following change is incorporated for alignment with the ISO C standard:

- The type of argument *clock* is changed from **time_t*** to **const time_t***.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

The *ctime_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *ctime*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

Extensions beyond the ISO C standard are now marked.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

8185 **NAME**

8186 daylight — daylight savings time flag

8187 **SYNOPSIS**

8188 XSI
```
#include <time.h>
```

8189
```
extern int daylight;
```

8190

8191 **DESCRIPTION**

8192 Refer to *tzset*( ).

8193 **NAME**

8194 dbm_clearerr, dbm_close, dbm_delete, dbm_error, dbm_fetch, dbm_firstkey, dbm_nextkey,
8195 dbm_open, dbm_store — database functions

8196 **SYNOPSIS**

8197 XSI
```
#include <ndbm.h>

int dbm_clearerr(DBM *db);
void dbm_close(DBM *db);
int dbm_delete(DBM *db, datum key);
int dbm_error(DBM *db);
datum dbm_fetch(DBM *db, datum key);
datum dbm_firstkey(DBM *db);
datum dbm_nextkey(DBM *db);
DBM *dbm_open(const char *file, int open_flags, mode_t file_mode);
int dbm_store(DBM *db, datum key, datum content, int store_mode);
```
8207

8208 **DESCRIPTION**

8209 These functions create, access, and modify a database.

8210 A **datum** consists of at least two members, *dptr* and *dsize*. The *dptr* member points to an object
8211 that is *dsize* bytes in length. Arbitrary binary data, as well as character strings, may be stored in
8212 the object pointed to by *dptr*.

8213 The database is stored in two files. One file is a directory containing a bit map of keys and has
8214 **.dir** as its suffix. The second file contains all data and has **.pag** as its suffix.

8215 The *dbm_open*( ) function shall open a database. The *file* argument to the function is the path
8216 name of the database. The function opens two files named *file***.dir** and *file***.pag**. The *open_flags*
8217 argument has the same meaning as the *flags* argument of *open*( ) except that a database opened
8218 for write-only access opens the files for read and write access and the behavior of the
8219 O_APPEND flag is unspecified. The *file_mode* argument has the same meaning as the third
8220 argument of *open*( ).

8221 The *dbm_close*( ) function shall close a database. The application shall ensure that argument *db* is
8222 a pointer to a **dbm** structure that has been returned from a call to *dbm_open*( ).

8223 The *dbm_fetch*( ) function shall read a record from a database. The argument *db* is a pointer to a
8224 database structure that has been returned from a call to *dbm_open*( ). The argument *key* is a
8225 **datum** that has been initialized by the application to the value of the key that matches the key of
8226 the record the program is fetching.

8227 The *dbm_store*( ) function shall write a record to a database. The argument *db* is a pointer to a
8228 database structure that has been returned from a call to *dbm_open*( ). The argument *key* is a
8229 **datum** that has been initialized by the application to the value of the key that identifies (for
8230 subsequent reading, writing, or deleting) the record the application is writing. The argument
8231 *content* is a **datum** that has been initialized by the application to the value of the record the
8232 program is writing. The argument *store_mode* controls whether *dbm_store*( ) replaces any pre-
8233 existing record that has the same key that is specified by the *key* argument. The application shall
8234 set *store_mode* to either DBM_INSERT or DBM_REPLACE. If the database contains a record that
8235 matches the *key* argument and *store_mode* is DBM_REPLACE, the existing record is replaced with
8236 the new record. If the database contains a record that matches the *key* argument and *store_mode*
8237 is DBM_INSERT, the existing record is left unchanged and the new record ignored. If the
8238 database does not contain a record that matches the *key* argument and *store_mode* is either
8239 DBM_INSERT or DBM_REPLACE, the new record is inserted in the database.

The application shall ensure that the sum of the sizes of a key/content pair does not exceed the internal block size. Moreover, the application shall ensure that all key/content pairs that hash together fit on a single block. The *dbm_store*( ) function shall return an error in the event that a disk block fills with inseparable data.

The *dbm_delete*( ) function shall delete a record and its key from the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open*( ). The argument *key* is a **datum** that has been initialized by the application to the value of the key that identifies the record the program is deleting.

The *dbm_firstkey*( ) function shall return the first key in the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open*( ).

The *dbm_nextkey*( ) function shall return the next key in the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open*( ). The application shall ensure that the *dbm_firstkey*( ) function is called before calling *dbm_nextkey*( ). Subsequent calls to *dbm_nextkey*( ) return the next key until all of the keys in the database have been returned.

The *dbm_error*( ) function shall return the error condition of the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open*( ).

The *dbm_clearerr*( ) function shall clear the error condition of the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open*( ).

These database functions shall support an internal block size large enough to support key/content pairs of at least 1 023 bytes.

The *dptr* pointers returned by these functions may point into static storage that may be changed by subsequent calls.

These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

The *dbm_store*( ) and *dbm_delete*( ) functions shall return 0 when they succeed and a negative value when they fail.

The *dbm_store*( ) function shall return 1 if it is called with a *flags* value of DBM_INSERT and the function finds an existing record with the same key.

The *dbm_error*( ) function shall return 0 if the error condition is not set and return a non-zero value if the error condition is set.

The return value of *dbm_clearerr*( ) is unspecified.

The *dbm_firstkey*( ) and *dbm_nextkey*( ) functions shall return a key **datum**. When the end of the database is reached, the *dptr* member of the key is a null pointer. If an error is detected, the *dptr* member of the key shall be a null pointer and the error condition of the database shall be set.

The *dbm_fetch*( ) function shall return a content **datum**. If no record in the database matches the key or if an error condition has been detected in the database, the *dptr* member of the content shall be a null pointer.

The *dbm_open*( ) function shall return a pointer to a database structure. If an error is detected during the operation, *dbm_open*( ) shall return a (**DBM***)0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The following code can be used to traverse the database:

```
for(key = dbm_firstkey(db); key.dptr != NULL; key = dbm_nextkey(db))
```

The *dbm_* functions provided in this library should not be confused in any way with those of a general-purpose database management system. These functions do not provide for multiple search keys per entry, they do not protect against multi-user access (in other words they do not lock records or files), and they do not provide the many other useful database functions that are found in more robust database management systems. Creating and updating databases by use of these functions is relatively slow because of data copies that occur upon hash collisions. These functions are useful for applications requiring fast lookup of relatively static information that is to be indexed by a single key.

The *dbm_delete*( ) function need not physically reclaim file space, although it does make it available for reuse by the database.

After calling *dbm_store*( ) or *dbm_delete*( ) during a pass through the keys by *dbm_firstkey*( ) and *dbm_nextkey*( ), the application should reset the database by calling *dbm_firstkey*( ) before again calling *dbm_nextkey*( ). The contents of these files are unspecified and may not be portable.

RATIONALE

None.

FUTURE DIRECTIONS

None.

8342 **CHANGE HISTORY**

8343 First released in Issue 4. Derived from the ISO C standard. |

NAME

dirname — report the parent directory name of a file path name

SYNOPSIS

XSI
```
#include <libgen.h>

char *dirname(char *path);
```

DESCRIPTION

The *dirname*( ) function shall take a pointer to a character string that contains a path name, and return a pointer to a string that is a path name of the parent directory of that file. Trailing '//' characters in the path are not counted as part of the path.

If *path* does not contain a '//', then *dirname*( ) shall return a pointer to the string ".". If *path* is a null pointer or points to an empty string, *dirname*( ) shall return a pointer to the string ".".

The *dirname*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

The *dirname*( ) function shall return a pointer to a string that is the parent directory of *path*. If *path* is a null pointer or points to an empty string, a pointer to a string "." is returned.

The *dirname*( ) function may modify the string pointed to by *path*, and may return a pointer to static storage that may then be overwritten by subsequent calls to *dirname*( ).

ERRORS

No errors are defined.

EXAMPLES

The following code fragment reads a path name, changes the current working directory to the parent directory, and opens the file.

```
char path[MAXPATHLEN], *pathcopy;
int fd;
fgets(path, MAXPATHLEN, stdin);
pathcopy = strdup(path);
chdir(dirname(pathcopy));
fd = open(basename(path), O_RDONLY);
```

Sample Input and Output Strings for dirname( )

In the following table, the input string is the value pointed to by *path*, and the output string is the return value of the *dirname*( ) function.

Input String	Output String
"/usr/lib"	"/usr"
"/usr/"	"/"
"usr"	"."
"/"	"/"
"."	"."
".."	"."

Changing the Current Directory to the Parent Directory

The following program fragment reads a path name, changes the current working directory to the parent directory, and opens the file.

```
#include <unistd.h>
#include <limits.h>
#include <stdio.h>
#include <fcntl.h>
#include <string.h>
#include <libgen.h>
...
char path[PATH_MAX], *pathcopy;
int fd;
...
fgets(path, PATH_MAX, stdin);
pathcopy = strdup(path);
chdir(dirname(pathcopy));
fd = open(basename(path), O_RDONLY);
```

APPLICATION USAGE

The *dirname*( ) and *basename*( ) functions together yield a complete path name. The expression *dirname*(*path*) obtains the path name of the directory where *basename*(*path*) is found.

Since the meaning of the leading `"//"` is implementation-defined, *dirname*("**//foo**) may return either `"//"` or `'//'` (but nothing else).

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

8419 **NAME**

8420 div — compute the quotient and remainder of an integer division

8421 **SYNOPSIS**

8422 ```
#include <stdlib.h>
```

8423 ```
div_t div(int numer, int denom);
```

8424 **DESCRIPTION**

8425 CX The functionality described on this reference page is aligned with the ISO C standard. Any
8426 conflict between the requirements described here and the ISO C standard is unintentional. This
8427 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

8428 The *div*( ) function shall compute the quotient and remainder of the division of the numerator
8429 *numer* by the denominator *denom*. If the division is inexact, the resulting quotient is the integer
8430 of lesser magnitude that is the nearest to the algebraic quotient. If the result cannot be
8431 represented, the behavior is undefined; otherwise, *quot***denom*+*rem* shall equal *numer*.

8432 **RETURN VALUE**

8433 The *div*( ) function shall return a structure of type **div_t**, comprising both the quotient and the
8434 remainder. The structure includes the following members, in any order:

8435 ```
int quot; /* quotient */
```
8436 ```
int  rem;   /* remainder */
```

8437 **ERRORS**

8438 No errors are defined.

8439 **EXAMPLES**

8440 None.

8441 **APPLICATION USAGE**

8442 None.

8443 **RATIONALE**

8444 None.

8445 **FUTURE DIRECTIONS**

8446 None.

8447 **SEE ALSO**

8448 *ldiv*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdlib.h>** |

8449 **CHANGE HISTORY**

8450 First released in Issue 4. Derived from the ISO C standard. |

8451 **NAME**

8452 dlclose — close a *dlopen*( ) object

8453 **SYNOPSIS**

8454 XSI
```
#include <dlfcn.h>
```

8455
```
int dlclose(void *handle);
```

8456

8457 **DESCRIPTION**

8458 The *dlclose*( ) function is used to inform the system that the object referenced by a *handle* returned
8459 from a previous *dlopen*( ) invocation is no longer needed by the application.

8460 The use of *dlclose*( ) reflects a statement of intent on the part of the process, but does not create
8461 any requirement upon the implementation, such as removal of the code or symbols referenced
8462 by *handle*. Once an object has been closed using *dlclose*( ) an application should assume that its
8463 symbols are no longer available to *dlsym*( ). All objects loaded automatically as a result of
8464 invoking *dlopen*( ) on the referenced object are also closed if this is the last reference to it.

8465 Although a *dlclose*( ) operation is not required to remove structures from an address space,
8466 neither is an implementation prohibited from doing so. The only restriction on such a removal is
8467 that no object shall be removed to which references have been relocated, until or unless all such
8468 references are removed. For instance, an object that had been loaded with a *dlopen*( ) operation
8469 specifying the RTLD_GLOBAL flag might provide a target for dynamic relocations performed in
8470 the processing of other objects—in such environments, an application may assume that no
8471 relocation, once made, shall be undone or remade unless the object requiring the relocation has
8472 itself been removed.

8473 **RETURN VALUE**

8474 If the referenced object was successfully closed, *dlclose*( ) shall return 0. If the object could not be
8475 closed, or if *handle* does not refer to an open object, *dlclose*( ) shall return a non-zero value. More
8476 detailed diagnostic information shall be available through *dlerror*( ).

8477 **ERRORS**

8478 No errors are defined.

8479 **EXAMPLES**

8480 The following example illustrates use of *dlopen*( ) and *dlclose*( ):

```
8481 ...
8482 /* Open a dynamic library and then close it ... */

8483 #include <dlfcn.h>
8484 void *mylib;
8485 int eret;

8486 mylib = dlopen("mylib.so.1", RTLD_LAZY);
8487 ...
8488 eret = dlclose(mylib);
8489 ...
```

8490 **APPLICATION USAGE**

8491 A portable application should employ a *handle* returned from a *dlopen*( ) invocation only within a
8492 given scope bracketed by the *dlopen*( ) and *dlclose*( ) operations. Implementations are free to use
8493 reference counting or other techniques such that multiple calls to *dlopen*( ) referencing the same
8494 object may return the same object for *handle*. Implementations are also free to reuse a *handle*.
8495 For these reasons, the value of a *handle* must be treated as an opaque object by the application,
8496 used only in calls to *dlsym*( ) and *dlclose*( ).

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

dlerror( ), *dlopen*( ), *dlsym*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<dlfcn.h>**

CHANGE HISTORY

First released in Issue 5.

Issue 6

The DESCRIPTION is updated to say that the referenced object is closed ‘‘if this is the last reference to it’’.

8508 **NAME**

8509 dlerror — get diagnostic information

8510 **SYNOPSIS**

8511 XSI
```
#include <dlfcn.h>
```
8512
```
char *dlerror(void);
```
8513

8514 **DESCRIPTION**

8515 The *dlerror*( ) function shall return a null-terminated character string (with no trailing <newline>)
8516 that describes the last error that occurred during dynamic linking processing. If no dynamic
8517 linking errors have occurred since the last invocation of *dlerror*( ), *dlerror*( ) shall return NULL.
8518 Thus, invoking *dlerror*( ) a second time, immediately following a prior invocation, shall result in
8519 NULL being returned.

8520 The *dlerror*( ) function need not be reentrant. A function that is not required to be reentrant is not
8521 required to be thread-safe.

8522 **RETURN VALUE**

8523 If successful, *dlerror*( ) shall return a null-terminated character string; otherwise, NULL shall be
8524 returned.

8525 **ERRORS**

8526 No errors are defined.

8527 **EXAMPLES**

8528 The following example prints out the last dynamic linking error:

8529
```
...
```
8530
```
#include <dlfcn.h>
```
8531
```
char *errstr;
```
8532
```
errstr = dlerror();
if (errstr != NULL)
printf ("A dynamic linking error occurred: (%s)\n", errstr);
```
8535
```
...
```

8536 **APPLICATION USAGE**

8537 The messages returned by *dlerror*( ) may reside in a static buffer that is overwritten on each call
8538 to *dlerror*( ). Application code should not write to this buffer. Programs wishing to preserve an
8539 error message should make their own copies of that message. Depending on the application
8540 environment with respect to asynchronous execution events, such as signals or other
8541 asynchronous computation sharing the address space, portable applications should use a critical
8542 section to retrieve the error pointer and buffer.

8543 **RATIONALE**

8544 None.

8545 **FUTURE DIRECTIONS**

8546 None.

8547 **SEE ALSO**

8548 *dlclose*( ), *dlopen*( ), *dlsym*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<dlfcn.h>**

8549 **CHANGE HISTORY**

8550 First released in Issue 5.

8551 **Issue 6**

8552 In the DESCRIPTION the note about reentrancy and thread-safety is added.

8553 **NAME**

8554 dlopen — gain access to an executable object file

8555 **SYNOPSIS**

8556 XSI
```
#include <dlfcn.h>
```

8557
```
void *dlopen(const char *file, int mode);
```

8558

8559 **DESCRIPTION**

8560 The *dlopen*( ) function shall make an executable object file specified by *file* available to the calling
8561 program. The class of files eligible for this operation and the manner of their construction are
8562 specified by the implementation, though typically such files are executable objects such as
8563 shared libraries, relocatable files, or programs. Note that some implementations permit the
8564 construction of dependencies between such objects that are embedded within files. In such
8565 cases, a *dlopen*( ) operation shall load such dependencies in addition to the object referenced by
8566 *file*. Implementations may also impose specific constraints on the construction of programs that
8567 can employ *dlopen*( ) and its related services.

8568 A successful *dlopen*( ) shall return a *handle* which the caller may use on subsequent calls to
8569 *dlsym*( ) and *dlclose*( ). The value of this *handle* should not be interpreted in any way by the caller.

8570 *file* is used to construct a path name to the object file. If *file* contains a slash character, the *file*
8571 argument is used as the path name for the file. Otherwise, *file* is used in an implementation- |
8572 defined manner to yield a path name. |

8573 If the value of *file* is 0, *dlopen*( ) shall provide a *handle* on a global symbol object. This object
8574 provides access to the symbols from an ordered set of objects consisting of the original program
8575 image file, together with any objects loaded at program start-up as specified by that process
8576 image file (for example, shared libraries), and the set of objects loaded using a *dlopen*( ) operation
8577 together with the RTLD_GLOBAL flag. As the latter set of objects can change during execution,
8578 the set identified by *handle* can also change dynamically.

8579 Only a single copy of an object file is brought into the address space, even if *dlopen*( ) is invoked
8580 multiple times in reference to the file, and even if different path names are used to reference the
8581 file.

8582 The *mode* parameter describes how *dlopen*( ) shall operate upon *file* with respect to the processing
8583 of relocations and the scope of visibility of the symbols provided within *file*. When an object is
8584 brought into the address space of a process, it may contain references to symbols whose
8585 addresses are not known until the object is loaded. These references shall be relocated before the
8586 symbols can be accessed. The *mode* parameter governs when these relocations take place and
8587 may have the following values:

8588 RTLD_LAZY — Relocations shall be performed at an implementation-defined time, |
8589 ranging from the time of the *dlopen*( ) call until the first reference to a
8590 given symbol occurs. Specifying RTLD_LAZY should improve
8591 performance on implementations supporting dynamic symbol binding as
8592 a process may not reference all of the functions in any given object. And,
8593 for systems supporting dynamic symbol resolution for normal process
8594 execution, this behavior mimics the normal handling of process
8595 execution.

8596 RTLD_NOW — All necessary relocations shall be performed when the object is first
8597 loaded. This may waste some processing if relocations are performed for
8598 functions that are never referenced. This behavior may be useful for
8599 applications that need to know as soon as an object is loaded that all |

symbols referenced during execution are available.

Any object loaded by *dlopen*( ) that requires relocations against global symbols can reference the symbols in the original process image file, any objects loaded at program start-up, from the object itself as well as any other object included in the same *dlopen*( ) invocation, and any objects that were loaded in any *dlopen*( ) invocation and which specified the RTLD_GLOBAL flag. To determine the scope of visibility for the symbols loaded with a *dlopen*( ) invocation, the *mode* parameter should be a bitwise-inclusive OR with one of the following values:

RTLD_GLOBAL — The object's symbols shall be made available for the relocation processing of any other object. In addition, symbol lookup using *dlopen*(*0*, *mode*) and an associated *dlsym*( ) allows objects loaded with this *mode* to be searched.

RTLD_LOCAL — The object's symbols shall not be made available for the relocation processing of any other object.

If neither RTLD_GLOBAL nor RTLD_LOCAL are specified, then an implementation-defined default behavior shall be applied.

If a *file* is specified in multiple *dlopen*( ) invocations, *mode* is interpreted at each invocation. Note, however, that once RTLD_NOW has been specified all relocations shall have been completed rendering further RTLD_NOW operations redundant and any further RTLD_LAZY operations irrelevant. Similarly, note that once RTLD_GLOBAL has been specified the object shall maintain the RTLD_GLOBAL status regardless of any previous or future specification of RTLD_LOCAL, as long as the object remains in the address space (see *dlclose*( )).

Symbols introduced into a program through calls to *dlopen*( ) may be used in relocation activities. Symbols so introduced may duplicate symbols already defined by the program or previous *dlopen*( ) operations. To resolve the ambiguities such a situation might present, the resolution of a symbol reference to symbol definition is based on a symbol resolution order. Two such resolution orders are defined: *load* or *dependency* ordering. Load order establishes an ordering among symbol definitions, such that the definition first loaded (including definitions from the image file and any dependent objects loaded with it) has priority over objects added later (via *dlopen*( )). Load ordering is used in relocation processing. Dependency ordering uses a breadth-first order starting with a given object, then all of its dependencies, then any dependents of those, iterating until all dependencies are satisfied. With the exception of the global symbol object obtained via a *dlopen*( ) operation on a *file* of 0, dependency ordering is used by the *dlsym*( ) function. Load ordering is used in *dlsym*( ) operations upon the global symbol object.

When an object is first made accessible via *dlopen*( ) it and its dependent objects are added in dependency order. Once all the objects are added, relocations are performed using load order. Note that if an object or its dependencies had been previously loaded, the load and dependency orders may yield different resolutions.

The symbols introduced by *dlopen*( ) operations, and available through *dlsym*( ) are at a minimum those which are exported as symbols of global scope by the object. Typically such symbols shall be those that were specified in (for example) C source code as having *extern* linkage. The precise manner in which an implementation constructs the set of exported symbols for a *dlopen*( ) object is specified by that implementation.

RETURN VALUE

If *file* cannot be found, cannot be opened for reading, is not of an appropriate object format for processing by *dlopen*( ), or if an error occurs during the process of loading *file* or relocating its symbolic references, *dlopen*( ) shall return NULL. More detailed diagnostic information shall be available through *dlerror*( ).

8658 **CHANGE HISTORY**

8659 First released in Issue 5.

NAME

dlsym — obtain the address of a symbol from a *dlopen*( ) object

SYNOPSIS

XSI
```
#include <dlfcn.h>

void *dlsym(void *restrict handle, const char *restrict name);
```

DESCRIPTION

The *dlsym*( ) function allows a process to obtain the address of a symbol defined within an object made accessible through a *dlopen*( ) call. *handle* is the value returned from a call to *dlopen*( ) (and which has not since been released via a call to *dlclose*( )), and *name* is the symbol's name as a character string.

The *dlsym*( ) function shall search for the named symbol in all objects loaded automatically as a result of loading the object referenced by *handle* (see *dlopen*( )). Load ordering is used in *dlsym*( ) operations upon the global symbol object. The symbol resolution algorithm used shall be dependency order as described in *dlopen*( ).

The RTLD_NEXT flag is reserved for future use.

RETURN VALUE

If *handle* does not refer to a valid object opened by *dlopen*( ), or if the named symbol cannot be found within any of the objects associated with *handle*, *dlsym*( ) shall return NULL. More detailed diagnostic information shall be available through *dlerror*( ).

ERRORS

No errors are defined.

EXAMPLES

The following example shows how *dlopen*( ) and *dlsym*( ) can be used to access either function or data objects. For simplicity, error checking has been omitted.

```
void    *handle;
int     *iptr, (*fptr)(int);

/* open the needed object */
handle = dlopen("/usr/home/me/libfoo.so.1", RTLD_LAZY);

/* find the address of function and data objects */
fptr = (int (*)(int))dlsym(handle, "my_function");
iptr = (int *)dlsym(handle, "my_object");

/* invoke function, passing value of integer as a parameter */
(*fptr)(*iptr);
```

APPLICATION USAGE

Special purpose values for *handle* are reserved for future use. These values and their meanings are:

RTLD_NEXT — Specifies the next object after this one that defines *name*. *This one* refers to the object containing the invocation of *dlsym*( ). The *next* object is the one found upon the application of a load order symbol resolution algorithm (see *dlopen*( )). The next object is either one of global scope (because it was introduced as part of the original process image or because it was added with a *dlopen*( ) operation including the RTLD_GLOBAL flag), or is an object that was included in the same *dlopen*( ) operation that loaded this one.

The RTLD_NEXT flag is useful to navigate an intentionally created hierarchy of multiply-defined symbols created through *interposition*. For example, if a program wished to create an implementation of *malloc*( ) that embedded some statistics gathering about memory allocations, such an implementation could use the real *malloc*( ) definition to perform the memory allocation—and itself only embed the necessary logic to implement the statistics gathering function.

CHANGE HISTORY

First released in Issue 5.

Issue 6

The **restrict** keyword is added to the *dlsym*( ) prototype for alignment with the ISO/IEC 9899:1999 standard.

NAME

drand48, erand48, jrand48, lcong48, lrand48, mrand48, nrand48, seed48, srand48 — generate uniformly distributed pseudo-random numbers

SYNOPSIS

XSI

```
#include <stdlib.h>

double drand48(void);
double erand48(unsigned short xsubi[3]);
long jrand48(unsigned short xsubi[3]);
void lcong48(unsigned short param[7]);
long lrand48(void);
long mrand48(void);
long nrand48(unsigned short xsubi[3]);
unsigned short *seed48(unsigned short seed16v[3]);
void srand48(long seedval);
```

DESCRIPTION

This family of functions generates pseudo-random numbers using a linear congruential algorithm and 48-bit integer arithmetic.

The *drand48*( ) and *erand48*( ) functions shall return non-negative, double-precision, floating-point values, uniformly distributed over the interval [0.0,1.0).

The *lrand48*( ) and *nrand48*( ) functions shall return non-negative, long integers, uniformly distributed over the interval $[0,2^{31})$.

The *mrand48*( ) and *jrand48*( ) functions shall return signed long integers uniformly distributed over the interval $[-2^{31},2^{31})$.

The *srand48*( ), *seed48*( ), and *lcong48*( ) are initialization entry points, one of which should be invoked before either *drand48*( ), *lrand48*( ), or *mrand48*( ) is called. (Although it is not recommended practice, constant default initializer values shall be supplied automatically if *drand48*( ), *lrand48*( ), or *mrand48*( ) is called without a prior call to an initialization entry point.) The *erand48*( ), *nrand48*( ), and *jrand48*( ) functions do not require an initialization entry point to be called first.

All the routines work by generating a sequence of 48-bit integer values, X_i, according to the linear congruential formula:

$$X_{n+1} = (aX_n + c)_{\mathrm{mod}\ m} \qquad n \geq 0$$

The parameter $m = 2^{48}$; hence 48-bit integer arithmetic is performed. Unless *lcong48*( ) is invoked, the multiplier value a and the addend value c are given by:

$$a = 5\mathrm{DEECE66D}_{16} = 273673163155_8$$

$$c = \mathrm{B}_{16} = 13_8$$

The value returned by any of the *drand48*( ), *erand48*( ), *jrand48*( ), *lrand48*( ), *mrand48*( ), or *nrand48*( ) functions is computed by first generating the next 48-bit X_i in the sequence. Then the appropriate number of bits, according to the type of data item to be returned, are copied from the high-order (leftmost) bits of X_i and transformed into the returned value.

The *drand48*( ), *lrand48*( ), and *mrand48*( ) functions store the last 48-bit X_i generated in an internal buffer; that is why the application shall ensure that these are initialized prior to being invoked. The *erand48*( ), *nrand48*( ), and *jrand48*( ) functions require the calling program to provide storage for the successive X_i values in the array specified as an argument when the

functions are invoked. That is why these routines do not have to be initialized; the calling program merely has to place the desired initial value of X_i into the array and pass it as an argument. By using different arguments, *erand48*(), *nrand48*(), and *jrand48*() allow separate modules of a large program to generate several *independent* streams of pseudo-random numbers; that is, the sequence of numbers in each stream shall *not* depend upon how many times the routines are called to generate numbers for the other streams.

The initializer function *srand48*() sets the high-order 32 bits of X_i to the low-order 32 bits contained in its argument. The low-order 16 bits of X_i are set to the arbitrary value $330E_{16}$.

The initializer function *seed48*() sets the value of X_i to the 48-bit value specified in the argument array. The low-order 16 bits of X_i are set to the low-order 16 bits of *seed16v*[*0*]. The mid-order 16 bits of X_i are set to the low-order 16 bits of *seed16v*[*1*]. The high-order 16 bits of X_i are set to the low-order 16 bits of *seed16v*[*2*]. In addition, the previous value of X_i is copied into a 48-bit internal buffer, used only by *seed48*(), and a pointer to this buffer is the value returned by *seed48*(). This returned pointer, which can just be ignored if not needed, is useful if a program is to be restarted from a given point at some future time—use the pointer to get at and store the last X_i value, and then use this value to re-initialize via *seed48*() when the program is restarted.

The initializer function *lcong48*() allows the user to specify the initial X_i, the multiplier value *a*, and the addend value *c*. Argument array elements *param*[*0-2*] specify X_i, *param*[*3-5*] specify the multiplier *a*, and *param*[*6*] specifies the 16-bit addend *c*. After *lcong48*() is called, a subsequent call to either *srand48*() or *seed48*() shall restore the standard multiplier and addend values, *a* and *c*, specified above.

The *drand48*(), *lrand48*(), and *mrand48*() functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

As described in the DESCRIPTION above.

ERRORS

No errors are defined.

SEE ALSO

rand(), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdlib.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The type **long** is replaced by **long** and the type **unsigned short** is replaced by **unsigned short** in the SYNOPSIS section.

In the DESCRIPTION, the description of *srand48*() is amended to fix a limitation in Issue 3, which indicates that the high-order 32 bits of X_i are set to the {LONG_BIT} bits in the argument. Though unintentional, the implication of this statement is that {LONG_BIT} would be 32 on all

systems compliant with Issue 3, when in fact Issue 3 imposes no such restriction.

The **<stdlib.h>** header is added to the SYNOPSIS section.

The argument list for the *lrand48*( ) and *mrand48*( ) functions now contains **void**.

Issue 5

A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

Issue 6

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

8818 **NAME**

8819 dup, dup2 — duplicate an open file descriptor

8820 **SYNOPSIS**

8821 `#include <unistd.h>`

8822 `int dup(int fildes);`
8823 `int dup2(int fildes, int fildes2);`

8824 **DESCRIPTION**

8825 The *dup*( ) and *dup2*( ) functions provide an alternative interface to the service provided by
8826 *fcntl*( ) using the F_DUPFD command. The call:

8827 `fid = dup(fildes);`

8828 is equivalent to:

8829 `fid = fcntl(fildes, F_DUPFD, 0);`

8830 The call:

8831 `fid = dup2(fildes, fildes2);`

8832 is equivalent to:

8833 `close(fildes2);`
8834 `fid = fcntl(fildes, F_DUPFD, fildes2);`

8835 except for the following:

8836 • If *fildes2* is less than 0 or greater than or equal to {OPEN_MAX}, *dup2*( ) shall return –1 with
8837 *errno* set to [EBADF]. |

8838 • If *fildes* is a valid file descriptor and is equal to *fildes2*, *dup2*( ) shall return *fildes2* without
8839 closing it.

8840 • If *fildes* is not a valid file descriptor, *dup2*( ) shall return –1 and shall not close *fildes2*.

8841 • The value returned shall be equal to the value of *fildes2* upon successful completion, or –1
8842 upon failure.

8843 **RETURN VALUE**

8844 Upon successful completion a non-negative integer, namely the file descriptor, shall be returned;
8845 otherwise, –1 shall be returned and *errno* set to indicate the error.

8846 **ERRORS**

8847 The *dup*( ) function shall fail if:

8848 [EBADF] The *fildes* argument is not a valid open file descriptor. |

8849 [EMFILE] The number of file descriptors in use by this process would exceed |
8850 {OPEN_MAX}.

8851 The *dup2*( ) function shall fail if:

8852 [EBADF] The *fildes* argument is not a valid open file descriptor or the argument *fildes2* is |
8853 negative or greater than or equal to {OPEN_MAX}.

8854 [EINTR] The *dup2*( ) function was interrupted by a signal. |

EXAMPLES

Redirecting Standard Output to a File

The following example closes standard output for the current processes, re-assigns standard output to go to the file referenced by *pfd*, and closes the original file descriptor to clean up.

```
#include <unistd.h>
...
int pfd;
...
close(1);
dup(pfd);
close(pfd);
...
```

Redirecting Error Messages

The following example redirects messages from *stderr* to *stdout*.

```
#include <unistd.h>
...
dup2(1, 2);
...
```

APPLICATION USAGE

None.

RATIONALE

The *dup*( ) and *dup2*( ) functions are redundant. Their services are also provided by the *fcntl*( ) function. They have been included in this volume of IEEE Std. 1003.1-200x primarily for historical reasons, since many existing applications use them.

While the brief code segment shown is very similar in behavior to *dup2*( ), a conforming implementation based on other functions defined in this volume of IEEE Std. 1003.1-200x is significantly more complex. Least obvious is the possible effect of a signal-catching function that could be invoked between steps and allocate or deallocate file descriptors. This could be avoided by blocking signals.

The *dup2*( ) function is not marked obsolescent because it presents a type-safe version of functionality provided in a type-unsafe version by *fcntl*( ). It is used in the POSIX Ada binding.

The *dup2*( ) function is not intended for use in critical regions as a synchronization mechanism.

In the description of [EBADF], the case of *fildes* being out of range is covered by the given case of *fildes* not being valid. The descriptions for *fildes* and *fildes2* are different because the only kind of invalidity that is relevant for *fildes2* is whether it is out of range; that is, it does not matter whether *fildes2* refers to an open file when the *dup2*( ) call is made.

FUTURE DIRECTIONS

None.

SEE ALSO

close( ), *fcntl*( ), *open*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<unistd.h>**

8895 **CHANGE HISTORY**

8896 First released in Issue 1. Derived from Issue 1 of the SVID.

8897 **Issue 4**

8898 The **<unistd.h>** header is added to the SYNOPSIS section.

8899 [EINTR] is no longer required for *dup*( ) because *fcntl*( ) does not return [EINTR] for F_DUPFD.

8900 The following changes are incorporated for alignment with the ISO POSIX-1 standard:

8901 • In the DESCRIPTION, the fourth bullet item describing differences between *dup*( ) and
8902 *dup2*( ) is added.

8903 • In the ERRORS section, error values returned by *dup*( ) and *dup2*( ) are now described
8904 separately.

8905 **Issue 6**

8906 The RATIONALE section is added.

8907 **NAME**

8908 ecvt, fcvt, gcvt — convert a floating-point number to a string (**LEGACY**)

8909 **SYNOPSIS**

8910 XSI
```
#include <stdlib.h>

char *ecvt(double value, int ndigit, int *restrict decpt,
    int *restrict sign);
char *fcvt(double value, int ndigit, int *restrict decpt,
    int *restrict sign);
char *gcvt(double value, int ndigit, char *buf);
```
8916

8917 **DESCRIPTION**

8918 The *ecvt*( ), *fcvt*( ), and *gcvt*( ) functions shall convert floating-point numbers to null-terminated
8919 strings.

8920 The *ecvt*( ) function shall convert *value* to a null-terminated string of *ndigit* digits (where *ndigit* is
8921 reduced to an unspecified limit determined by the precision of a **double**) and return a pointer to
8922 the string. The high-order digit is non-zero, unless the value is 0. The low-order digit is rounded.
8923 The position of the radix character relative to the beginning of the string is stored in the integer
8924 pointed to by *decpt* (negative means to the left of the returned digits). If *value* is zero, it is
8925 unspecified whether the integer pointed to by *decpt* would be 0 or 1. The radix character is not
8926 included in the returned string. If the sign of the result is negative, the integer pointed to by *sign*
8927 is non-zero; otherwise, it is 0.

8928 If the converted value is out of range or is not representable, the contents of the returned string
8929 are unspecified.

8930 The *fcvt*( ) function is identical to *ecvt*( ) except that *ndigit* specifies the number of digits desired
8931 after the radix character. The total number of digits in the result string is restricted to an
8932 unspecified limit as determined by the precision of a **double**.

8933 The *gcvt*( ) function shall convert *value* to a null-terminated string (similar to that of the %*g*
8934 format of *printf*( )) in the array pointed to by *buf* and return *buf*. It produces *ndigit* significant
8935 digits (limited to an unspecified value determined by the precision of a **double**) in %*f* if possible,
8936 or %*e* (scientific notation) otherwise. A minus sign is included in the returned string if *value* is
8937 less than 0. A radix character is included in the returned string if *value* is not a whole number.
8938 Trailing zeros are suppressed where *value* is not a whole number. The radix character is
8939 determined by the current locale. If *setlocale*( ) has not been called successfully, the default locale,
8940 POSIX, is used. The default locale specifies a period (`'.'`) as the radix character. The
8941 *LC_NUMERIC* category determines the value of the radix character within the current locale.

8942 These functions need not be reentrant. A function that is not required to be reentrant is not
8943 required to be thread-safe.

8944 **RETURN VALUE**

8945 The *ecvt*( ) and *fcvt*( ) functions shall return a pointer to a null-terminated string of digits.

8946 The *gcvt*( ) function shall return *buf*.

8947 The return values from *ecvt*( ) and *fcvt*( ) may point to static data which may be overwritten by
8948 subsequent calls to these functions.

8949 **ERRORS**

8950 No errors are defined.

8951 **EXAMPLES**

8952 None.

8953 **APPLICATION USAGE**

8954 *sprintf*( ) is preferred over this function.

8955 **RATIONALE**

8956 None.

8957 **FUTURE DIRECTIONS**

8958 These functions may be withdrawn in a future version.

8959 **SEE ALSO**

8960 *printf*( ), *setlocale*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdlib.h>** |

8961 **CHANGE HISTORY**

8962 First released in Issue 4, Version 2.

8963 **Issue 5**

8965 Normative text previously in the APPLICATION USAGE section is moved to the
8966 DESCRIPTION.

8967 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

8968 **Issue 6**

8969 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

8970 This function is marked LEGACY. |

8971 The **restrict** keyword is added to the *ecvt*( ) and *fcvt*( ) prototypes for alignment with the |
8972 ISO/IEC 9899:1999 standard. |

NAME

encrypt — encoding function (**CRYPT**)

SYNOPSIS

XSI
```
#include <unistd.h>

void encrypt(char block[64], int edflag);
```

DESCRIPTION

The *encrypt*( ) function provides (rather primitive) access to an implementation-defined encoding algorithm. The key generated by *setkey*( ) is used to encrypt the string *block* with *encrypt*( ).

The *block* argument to *encrypt*( ) is an array of length 64 bytes containing only the bytes with numerical value of 0 and 1. The array is modified in place to a similar array using the key set by *setkey*( ). If *edflag* is 0, the argument is encoded. If *edflag* is 1, the argument may be decoded (see the APPLICATION USAGE section); if the argument is not decoded, *errno* shall be set to [ENOSYS].

The *encrypt*( ) function shall not change the setting of *errno* if successful. An application wishing to check for error situations should set *errno* to 0 before calling *encrypt*( ). If *errno* is non-zero on return, an error has occurred.

The *encrypt*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

The *encrypt*( ) function shall return no value.

ERRORS

The *encrypt*( ) function shall fail if:

[ENOSYS] The functionality is not supported on this implementation.

EXAMPLES

None.

APPLICATION USAGE

In some environments, decoding might not be implemented. This is related to U.S. Government restrictions on encryption and decryption routines: the DES decryption algorithm cannot be exported outside the U.S. Historical practice has been to ship a different version of the encryption library without the decryption feature in the routines supplied. Thus the exported version of *encrypt*( ) does encoding but not decoding.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

crypt( ), *setkey*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The **<unistd.h>** header is added to the SYNOPSIS section.

The DESCRIPTION is amended:

- To specify the encoding algorithm as implementation-defined
- To change entry to function
- To make decoding optional

The APPLICATION USAGE section is expanded to explain the restrictions on the availability of the DES decryption algorithm.

Issue 5

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

Issue 6

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

NAME

endgrent, getgrent, setgrent — group database entry functions

SYNOPSIS

XSI
```
#include <grp.h>

void endgrent(void);
struct group *getgrent(void);
void setgrent(void);
```

DESCRIPTION

The *endgrent*( ) function may be called to close the group database when processing is complete.

An implementation that provides extended security controls may impose further implementation-defined restrictions on accessing the group database. In particular, the system may deny the existence of some or all of the group database entries associated with groups other than those groups associated with the caller and may omit users other than the caller from the list of members of groups in database entries that are returned.

The *getgrent*( ) function shall return a pointer to a structure containing the broken-out fields of an entry in the group database. When first called, *getgrent*( ) shall return a pointer to a **group** structure containing the first entry in the group database. Thereafter, it shall return a pointer to a **group** structure containing the next group structure in the group database, so successive calls may be used to search the entire database.

The *setgrent*( ) function effectively rewinds the group database to allow repeated searches.

These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

When first called, *getgrent*( ) shall return a pointer to the first group structure in the group database. Upon subsequent calls it shall return the next group structure in the group database. The *getgrent*( ) function shall return a null pointer on end-of-file or an error and *errno* may be set to indicate the error.

The return value may point to a static area which is overwritten by a subsequent call to *getgrgid*( ), *getgrnam*( ), or *getgrent*( ).

ERRORS

The *getgrent*( ) function may fail if:

[EINTR]	A signal was caught during the operation.
[EIO]	An I/O error has occurred.
[EMFILE]	{OPEN_MAX} file descriptors are currently open in the calling process.
[ENFILE]	The maximum allowable number of files is currently open in the system.

9062 **EXAMPLES**

9063 None.

9064 **APPLICATION USAGE**

9065 These functions are provided due to their historical usage. Applications should avoid
9066 dependencies on fields in the group database, whether the database is a single file, or where in
9067 the file system name space the database resides. Applications should use *getgrnam*( ) and
9068 *getgrgid*( ) whenever possible because it avoids these dependencies.

9069 **RATIONALE**

9070 None.

9071 **FUTURE DIRECTIONS**

9072 None.

9073 **SEE ALSO**

9076 **CHANGE HISTORY**

9077 First released in Issue 4, Version 2.

9078 **Issue 5**

9079 Moved from X/OPEN UNIX extension to BASE.

9080 Normative text previously in the APPLICATION USAGE section is moved to the RETURN
9081 VALUE section.

9082 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

9083 **Issue 6**

9084 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

NAME

endhostent, freehostent, gethostent, sethostent — network host database functions

SYNOPSIS

```
#include <netdb.h>

void endhostent(void);
void freehostent(struct hostent *ptr);
struct hostent *gethostent(void);
void sethostent(int stayopen);
```

DESCRIPTION

These functions enable applications to retrieve information about hosts. This information is considered to be stored in a database that can be accessed sequentially or randomly. Implementation of this database is unspecified.

Note: In many cases it is implemented by the Domain Name System, as documented in RFC 1034, RFC 1035, and RFC 1886.

Entries are returned in **hostent** structures. Refer to *gethostbyaddr*( ) for a definition of the **hostent** structure.

The *endhostent*( ) function shall close the connection to the database, releasing any open file descriptor.

The *freehostent*( ) function shall free the memory occupied by the **hostent** structure pointed to by *ptr* and any structures pointed to from that structure, provided that **hostent** was obtained by a call to *getipnodebyaddr*( ) or *getipnodebyname*( ). Applications shall not call *freehostent*( ) except to pass it a pointer that was obtained from *getipnodebyaddr*( ) or *getipnodebyname*( ).

The *gethostent*( ) function shall read the next entry in the database, opening and closing a connection to the database as necessary.

The *sethostent*( ) function shall open a connection to the database and set the next entry for retrieval to the first entry in the database. If the *stayopen* argument is non-zero, the connection shall not be closed by a call to *gethostent*( ), *getipnodebyname*( ), *gethostbyname*( ), *getipnodebyaddr*( ), or *gethostbyaddr*( ), and the implementation may maintain an open file descriptor.

These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

Upon successful completion, the *gethostent*( ) function shall return a pointer to a **hostent** structure if the requested entry was found, and a null pointer if the end of the database was reached or the requested entry was not found.

ERRORS

No errors are defined for *endhostent*( ), *gethostent*( ), and *sethostent*( ).

EXAMPLES

None.

APPLICATION USAGE

The **hostent** structure returned by *getipnodebyaddr*( ) and *getipnodebyname*( ), and any structures pointed to from those structures, are dynamically allocated. Applications should call *freehostent*( ) to free the memory used by these structures.

The *gethostent*( ) function may return pointers to static data, which may be overwritten by subsequent calls to any of these functions. Applications shall not call *freehostent*( ) for this area.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

endservent( ), *gethostbyaddr*( ), *gethostbyname*( ), *getipnodebyaddr*( ), *getipnodebyname*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<netdb.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

NAME

endnetent, getnetbyaddr, getnetbyname, getnetent, setnetent — network database functions

SYNOPSIS

```
#include <netdb.h>

void endnetent(void);
struct netent *getnetbyaddr(uint32_t net, int type);
struct netent *getnetbyname(const char *name);
struct netent *getnetent(void);
void setnetent(int stayopen);
```

DESCRIPTION

These functions enable applications to retrieve information about networks. This information is considered to be stored in a database that can be accessed sequentially or randomly. Implementation of this database is unspecified.

The *endnetent*( ) function shall close the database, releasing any open file descriptor.

The *getnetbyaddr*( ) function shall search the database from the beginning, and find the first entry for which the address family specified by *type* matches the *n_addrtype* member and the network number *net* matches the *n_net* member, opening a connection to the database if necessary. The *net* argument shall be the network number in host byte order.

The *getnetbyname*( ) function shall search the database from the beginning and find the first entry for which the network name specified by *name* matches the *n_name* member, opening and closing a connection to the database as necessary.

The *getnetent*( ) function shall read the next entry of the database, opening a connection to the database if necessary.

The *setnetent*( ) function shall open and rewind the database. If the *stayopen* argument is non-zero, the connection to the *net* database shall not be closed after each call to *getnetent*( ) (either directly, or indirectly through one of the other *getnet**( ) functions), and the implementation may maintain an open file descriptor to the database.

The *getnetbyaddr*( ), *getnetbyname*( ), and *getnetent*( ), functions shall each return a pointer to a **netent** structure, the members of which shall contain the fields of an entry in the network database.

These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

Upon successful completion, *getnetbyaddr*( ), *getnetbyname*( ), and *getnetent*( ), shall return a pointer to a **netent** structure if the requested entry was found, and a null pointer if the end of the database was reached or the requested entry was not found. Otherwise, a null pointer shall be returned.

ERRORS

No errors are defined.

9177 **EXAMPLES**

9178 None.

9179 **APPLICATION USAGE**

9180 The *getnetbyaddr*( ), *getnetbyname*( ), and *getnetent*( ), functions may return pointers to static data,
9181 which may be overwritten by subsequent calls to any of these functions.

9182 **RATIONALE**

9183 None.

9184 **FUTURE DIRECTIONS**

9185 None.

9186 **SEE ALSO**

9187 The Base Definitions volume of IEEE Std. 1003.1-200x, **<netdb.h>**

9188 **CHANGE HISTORY**

9189 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

NAME

endprotoent, getprotobyname, getprotobynumber, getprotoent, setprotoent — network protocol database functions

SYNOPSIS

```
#include <netdb.h>

void endprotoent(void);
struct protoent *getprotobyname(const char *name);
struct protoent *getprotobynumber(int proto);
struct protoent *getprotoent(void);
void setprotoent(int stayopen);
```

DESCRIPTION

These functions enable applications to retrieve information about protocols. This information is considered to be stored in a database that can be accessed sequentially or randomly. Implementation of this database is unspecified.

The *endprotoent*( ) function shall close the connection to the database, releasing any open file descriptor.

The *getprotobyname*( ) function shall search the database from the beginning and find the first entry for which the protocol name specified by *name* matches the *p_name* member, opening a connection to the database if necessary.

The *getprotobynumber*( ) function shall search the database from the beginning and find the first entry for which the protocol number specified by *proto* matches the *p_proto* member, opening a connection to the database if necessary.

The *getprotoent*( ) function shall read the next entry of the database, opening and closing a connection to the database as necessary.

The *setprotoent*( ) function shall open a connection to the database, and set the next entry to the first entry. If the *stayopen* argument is non-zero, the connection to the network protocol database shall not be closed after each call to *getprotoent*( ) (either directly, or indirectly through one of the other *getproto**( ) functions), and the implementation may maintain an open file descriptor for the database.

The *getprotobyname*( ), *getprotobynumber*( ), and *getprotoent*( ), functions shall each return a pointer to a **protoent** structure, the members of which shall contain the fields of an entry in the network protocol database.

These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

Upon successful completion, *getprotobyname*( ), *getprotobynumber*( ), and *getprotoent*( ) return a pointer to a **protoent** structure if the requested entry was found, and a null pointer if the end of the database was reached or the requested entry was not found. Otherwise, a null pointer is returned.

ERRORS

No errors are defined.

9231 **EXAMPLES**

9232 None.

9233 **APPLICATION USAGE**

9234 The *getprotobyname*(), *getprotobynumber*(), and *getprotoent*() functions may return pointers to
9235 static data, which may be overwritten by subsequent calls to any of these functions.

9236 **RATIONALE**

9237 None.

9238 **FUTURE DIRECTIONS**

9239 None.

NAME

endpwent, getpwent, setpwent — user database functions

SYNOPSIS

XSI
```
#include <pwd.h>

void endpwent(void);
struct passwd *getpwent(void);
void setpwent(void);
```

DESCRIPTION

The *endpwent*( ) function may be called to close the user database when processing is complete.

An implementation that provides extended security controls may impose further implementation-defined restrictions on accessing the user database. In particular, the system may deny the existence of some or all of the user database entries associated with users other than the caller.

The *getpwent*( ) function shall return a pointer to a structure containing the broken-out fields of an entry in the user database. Each entry in the user database contains a **passwd** structure. When first called, *getpwent*( ) shall return a pointer to a **passwd** structure containing the first entry in the user database. Thereafter, it shall return a pointer to a **passwd** structure containing the next entry in the user database. Successive calls can be used to search the entire user database.

If an end-of-file or an error is encountered on reading, *getpwent*( ) shall return a null pointer.

The *setpwent*( ) function effectively rewinds the user database to allow repeated searches.

These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

The *getpwent*( ) function shall return a null pointer on end-of-file or error.

ERRORS

The *getpwent*( ), *setpwent*( ), and *endpwent*( ) functions may fail if:

[EIO] An I/O error has occurred.

In addition, *getpwent*( ) and *setpwent*( ) may fail if:

[EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

[ENFILE] The maximum allowable number of files is currently open in the system.

The return value may point to a static area which is overwritten by a subsequent call to *getpwuid*( ), *getpwnam*( ), or *getpwent*( ).

EXAMPLES

Searching the User Database

The following example uses the *getpwent*( ) function to get successive entries in the user database, returning a pointer to a **passwd** structure that contains information about each user. The call to *endpwent*( ) closes the user database and cleans up.

```
#include <pwd.h>
...
struct passwd *p;
...
```

```
        while ((p = getpwent ()) != NULL) {
        ...
        }
        endpwent();
        ...
```

APPLICATION USAGE

These functions are provided due to their historical usage. Applications should avoid dependencies on fields in the password database, whether the database is a single file, or where in the file system name space the database resides. Applications should use *getpwuid*() whenever possible because it avoids these dependencies.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

Issue 6

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

NAME

endservent, getservbyname, getservbyport, getservent, setservent — network services database functions

SYNOPSIS

```
#include <netdb.h>

void endservent(void);
struct servent *getservbyname(const char *name, const char *proto);
struct servent *getservbyport(int port, const char *proto);
struct servent *getservent(void);
void setservent(int stayopen);
```

DESCRIPTION

These functions enable applications to retrieve information about network services. This information is considered to be stored in a database that can be accessed sequentially or randomly. Implementation of this database is unspecified.

The *endservent*( ) function shall close the database, releasing any open file descriptor.

The *getservbyname*( ) function shall search the database from the beginning and find the first entry for which the service name specified by *name* matches the *s_name* member and the protocol name specified by *proto* matches the *s_proto* member, opening a connection to the database if necessary. If *proto* is a null pointer, any value of the *s_proto* member shall be matched.

The *getservbyport*( ) function shall search the database from the beginning and find the first entry for which the port specified by *port* matches the *s_port* member and the protocol name specified by *proto* matches the *s_proto* member, opening a connection to the database if necessary. If *proto* is a null pointer, any value of the *s_proto* member shall be matched. The *port* argument shall be in network byte order.

The *getservent*( ) function shall read the next entry of the database, opening and closing a connection to the database as necessary.

The *setservent*( ) function shall open a connection to the database, and set the next entry to the first entry. If the *stayopen* argument is non-zero, the *net* database shall not be closed after each call to the *getservent*( ) function (either directly, or indirectly through one of the other *getserv**( ) functions), and the implementation may maintain an open file descriptor for the database.

The *getservbyname*( ), *getservbyport*( ), and *getservent*( ) functions shall each return a pointer to a **servent** structure, the members of which shall contain the fields of an entry in the network services database.

These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

Upon successful completion, *getservbyname*( ), *getservbyport*( ), and *getservent*( ) return a pointer to a **servent** structure if the requested entry was found, and a null pointer if the end of the database was reached or the requested entry was not found. Otherwise, a null pointer is returned.

ERRORS

No errors are defined.

9353 **EXAMPLES**

9354 None.

9355 **APPLICATION USAGE**

9356 The *port* argument of *getservbyport*( ) need not be compatible with the port values of all address
9357 families.

9358 The *getservbyname*( ), *getservbyport*( ), and *getservent*( ) functions may return pointers to static
9359 data, which may be overwritten by subsequent calls to any of these functions.

9360 **RATIONALE**

NAME

endutxent, getutxent, getutxid, getutxline, pututxline, setutxent — user accounting database functions

SYNOPSIS

XSI
```
#include <utmpx.h>

void endutxent(void);
struct utmpx *getutxent(void);
struct utmpx *getutxid(const struct utmpx *id);
struct utmpx *getutxline(const struct utmpx *line);
struct utmpx *pututxline(const struct utmpx *utmpx);
void setutxent(void);
```

DESCRIPTION

These functions provide access to the user accounting database.

The *endutxent*( ) function closes the user accounting database.

An implementation that provides extended security controls may impose further implementation-defined restrictions on accessing the user accounting database. In particular, the system may deny the existence of some or all of the user accounting database entries associated with users other than the caller.

The *getutxent*( ) function reads in the next entry from the user accounting database. If the database is not already open, it opens it. If it reaches the end of the database, it fails.

The *getutxid*( ) function searches forward from the current point in the database. If the *ut_type* value of the **utmpx** structure pointed to by *id* is BOOT_TIME, OLD_TIME, or NEW_TIME, then it stops when it finds an entry with a matching *ut_type* value. If the *ut_type* value is INIT_PROCESS, LOGIN_PROCESS, USER_PROCESS, or DEAD_PROCESS, then it stops when it finds an entry whose type is one of these four and whose *ut_id* member matches the *ut_id* member of the **utmpx** structure pointed to by *id*. If the end of the database is reached without a match, *getutxid*( ) fails.

The *getutxid*( ) or *getutxline*( ) function may cache data. For this reason, to use *getutxline*( ) to search for multiple occurrences, it is necessary to zero out the static data after each success, or *getutxline*( ) could just return a pointer to the same **utmpx** structure over and over again.

There is one exception to the rule about removing the structure before further reads are done. The implicit read done by *pututxline*( ) (if it finds that it is not already at the correct place in the user accounting database) shall not modify the static structure returned by *getutxent*( ), *getutxid*( ), or *getutxline*( ), if the application has just modified this structure and passed the pointer back to *pututxline*( ).

For all entries that match a request, the *ut_type* member indicates the type of the entry. Other members of the entry shall contain meaningful data based on the value of the *ut_type* member as follows:

ut_type Member	Other Members with Meaningful Data
EMPTY	No others
BOOT_TIME	*ut_tv*
OLD_TIME	*ut_tv*
NEW_TIME	*ut_tv*
USER_PROCESS	*ut_id*, *ut_user* (login name of the user), *ut_line*, *ut_pid*, *ut_tv*
INIT_PROCESS	*ut_id*, *ut_pid*, *ut_tv*
LOGIN_PROCESS	*ut_id*, *ut_user* (implementation-defined name of the login process), *ut_pid*, *ut_tv*
DEAD_PROCESS	*ut_id*, *ut_pid*, *ut_tv*

The *getutxline*( ) function searches forward from the current point in the database until it finds an entry of the type LOGIN_PROCESS or USER_PROCESS which also has a *ut_line* value matching that in the **utmpx** structure pointed to by *line*. If the end of the database is reached without a match, *getutxline*( ) fails.

If the process has appropriate privileges, the *pututxline*( ) function writes out the structure into the user accounting database. It uses *getutxid*( ) to search for a record that satisfies the request. If this search succeeds, then the entry is replaced. Otherwise, a new entry is made at the end of the user accounting database.

The *setutxent*( ) function resets the input to the beginning of the database. This should be done before each search for a new entry if it is desired that the entire database be examined.

These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

Upon successful completion, *getutxent*( ), *getutxid*( ), and *getutxline*( ) shall return a pointer to a **utmpx** structure containing a copy of the requested entry in the user accounting database. Otherwise, a null pointer shall be returned.

The return value may point to a static area which is overwritten by a subsequent call to *getutxid*( ) or *getutxline*( ).

Upon successful completion, *pututxline*( ) shall return a pointer to a **utmpx** structure containing a copy of the entry added to the user accounting database. Otherwise, a null pointer shall be returned.

The *endutxent*( ) and *setutxent*( ) functions shall return no value.

ERRORS

No errors are defined for the *endutxent*( ), *getutxent*( ), *getutxid*( ), *getutxline*( ), and *setutxent*( ) functions.

The *pututxline*( ) function may fail if:

[EPERM] The process does not have appropriate privileges.

9446 **EXAMPLES**

9447 None.

9448 **APPLICATION USAGE**

9449 The sizes of the arrays in the structure can be found using the *sizeof* operator.

9450 **RATIONALE**

9451 None.

9458 **Issue 5**

9459 Moved from X/OPEN UNIX extension to BASE.

9460 Normative text previously in the APPLICATION USAGE section is moved to the
9461 DESCRIPTION.

9462 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

9463 **Issue 6**

9464 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

9465 **NAME**

9466 environ — array of character pointers to the environment strings

9467 **SYNOPSIS**

9468
```
extern char **environ;
```

9469 **DESCRIPTION**

9470 Refer to the Base Definitions volume of IEEE Std. 1003.1-200x, Chapter 8, Environment Variables |
9471 and *exec*. |

NAME

erand48 — generate uniformly distributed pseudo-random numbers

SYNOPSIS

XSI

```
#include <stdlib.h>

double erand48(unsigned short xsubi[3]);
```

DESCRIPTION

Refer to *drand48*( ).

9480 **NAME**

9481 erf, erfc, erfcf, erfcl, erff, erfl — error and complementary error functions

9482 **SYNOPSIS**

9483 XSI
```
#include <math.h>

double erf(double x);
double erfc(double x);
float erfcf(float x);
long double erfcl(long double x);
float erff(float x);
long double erfl(long double x);
```

9490

9491 **DESCRIPTION**

9492 The *erf*( ), *erff,*( ) and *erfl*( ) functions shall compute the error function of *x*, defined as:

9493 $$\frac{2}{\sqrt{\pi}}\int_0^x e^{-t^2}\,dt$$

9494 The *erfc*( ), *erfcf*( ), and *erfcl*( ) functions shall compute 1.0 – *erf*(*x*).

9495 An application wishing to check for error situations should set *errno* to 0 before calling *erf*( ). If
9496 *errno* is non-zero on return, or the return value is NaN, an error has occurred.

9497 **RETURN VALUE**

9498 Upon successful completion, these functions shall return the value of the error function and
9499 complementary error function, respectively.

9500 If *x* is NaN, NaN shall be returned and *errno* may be set to [EDOM].

9501 If the correct value would cause underflow, 0 shall be returned and *errno* may be set to
9502 [ERANGE].

9503 **ERRORS**

9504 The *erfc*( ), *erfcf*( ), and *erfcl*( ) functions shall fail if:

9505 [ERANGE] The value of *x* is too large.

9506 The *erf*( ) and *erfc*( ) functions may fail if:

9507 [EDOM] The value of *x* is NaN.

9508 [ERANGE] The result underflows

9509 No other errors shall occur.

9510 **EXAMPLES**

9511 None.

9512 **APPLICATION USAGE**

9513 The *erfc*( ) function is provided because of the extreme loss of relative accuracy if *erf*(*x*) is called
9514 for large *x* and the result subtracted from 1.0.

9515 **RATIONALE**

9516 None.

9517 **FUTURE DIRECTIONS**

9518 None.

SEE ALSO

isnan( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<math.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

References to *matherr*( ) are removed.

The RETURN VALUE and ERRORS sections are substantially rewritten to rationalize error handling in the mathematics functions.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *erfcf*( ), *erfcl*( ), *erff*( ), and *erfl*( ) functions are added for alignment with the ISO / IEC 9899: 1999 standard.

9533 **NAME**

9534 errno — error return value

9535 **SYNOPSIS**

9536 `#include <errno.h>`

9537 **DESCRIPTION**

9538 *errno* is used by many functions to return error values.

9539 Many functions provide an error number in *errno* which has type **int** and is defined in **<errno.h>**.
9540 The value of *errno* shall be defined only after a call to a function for which it is explicitly stated to
9541 be set and until it is changed by the next function call. The value of *errno* should only be
9542 examined when it is indicated to be valid by a function's return value. Programs should obtain
9543 the definition of *errno* by the inclusion of **<errno.h>**. No function in this volume of
9544 IEEE Std. 1003.1-200x shall set *errno* to 0.

9545 It is unspecified whether *errno* is a macro or an identifier declared with external linkage. If a
9546 macro definition is suppressed in order to access an actual object, or a program defines an
9547 identifier with the name *errno*, the behavior is undefined.

9548 The symbolic values stored in *errno* are documented in the ERRORS sections on all relevant
9549 pages.

9550 **RETURN VALUE**

9551 None.

9552 **ERRORS**

9553 None.

9554 **EXAMPLES**

9555 None.

9556 **APPLICATION USAGE**

9557 Previously both POSIX and X/Open documents were more restrictive than the ISO C standard
9558 in that they required *errno* to be defined as an external variable, whereas the ISO C standard
9559 required only that *errno* be defined as a modifiable **lvalue** with type **int**.

9560 A program that uses *errno* for error checking should set it to 0 before a function call, then inspect
9561 it before a subsequent function call.

9562 **RATIONALE**

9563 None.

9564 **FUTURE DIRECTIONS**

9565 None.

9567 Section 2.3, the Base Definitions volume of IEEE Std. 1003.1-200x, **<errno.h>**

9568 **CHANGE HISTORY**

9569 First released in Issue 1. Derived from Issue 1 of the SVID.

9570 **Issue 4**

9571 The FUTURE DIRECTIONS section is deleted.

9572 The following changes are incorporated for alignment with the ISO C standard:

9573 • The DESCRIPTION now guarantees that *errno* is set to 0 at program start-up, and that it is
9574 never reset to 0 by any XSI function.

- The APPLICATION USAGE section is added. This issue is aligned with the ISO C standard, which permits *errno* to be a macro.

Issue 5

The following sentence is deleted from the DESCRIPTION: ‘‘The value of *errno* is 0 at program start-up, but is never set to 0 by any XSI function’’. The DESCRIPTION also no longer states that conforming implementations may support the declaration:

```
extern int errno;
```

Issue 6

Obsolescent text regarding defining *errno* as:

```
extern int errno
```

is removed.

Text regarding no function setting *errno* to zero to indicate an error is changed to no function shall set *errno* to zero. This is for alignment with the ISO/IEC 9899:1999 standard.

9588 **NAME**

9589 environ, execl, execv, execle, execve, execlp, execvp — execute a file

9590 **SYNOPSIS**

9591
```
#include <unistd.h>
```

9592
```
extern char **environ;
```
9593
```
int execl(const char *path, const char *arg0, ... /*, (char *)0 */);
```
9594
```
int execv(const char *path, char *const argv[]);
```
9595
```
int execle(const char *path, const char *arg0, ... /*,
```
9596
```
    (char *)0, char *const envp[]*/);
```
9597
```
int execve(const char *path, char *const argv[], char *const envp[]);
```
9598
```
int execlp(const char *file, const char *arg0, ... /*, (char *)0 */);
```
9599
```
int execvp(const char *file, char *const argv[]);
```

9600 **DESCRIPTION**

9601 The *exec* functions shall replace the current process image with a new process image. The new
9602 image is constructed from a regular, executable file called the *new process image file*. There shall
9603 be no return from a successful *exec*, because the calling process image is overlaid by the new
9604 process image.

9605 When a C-language program is executed as a result of this call, it shall be entered as a C-
9606 language function call as follows:

9607
```
int main (int argc, char *argv[]);
```

9608 where *argc* is the argument count and *argv* is an array of character pointers to the arguments
9609 themselves. In addition, the following variable:

9610
```
extern char **environ;
```

9611 is initialized as a pointer to an array of character pointers to the environment strings. The *argv*
9612 and *environ* arrays are each terminated by a null pointer. The null pointer terminating the *argv*
9613 array is not counted in *argc*.

9614 THR Conforming multi-threaded applications shall not use the *environ* variable to access or modify
9615 any environment variable while any other thread is concurrently modifying any environment
9616 variable. A call to any function dependent on any environment variable shall be considered a use
9617 of the *environ* variable to access that environment variable.

9618 The arguments specified by a program with one of the *exec* functions shall be passed on to the
9619 new process image in the corresponding *main*( ) arguments.

9620 The argument *path* points to a path name that identifies the new process image file.

9621 The argument *file* is used to construct a path name that identifies the new process image file. If
9622 the *file* argument contains a slash character, the *file* argument shall be used as the path name for
9623 this file. Otherwise, the path prefix for this file is obtained by a search of the directories passed
9624 as the environment variable *PATH* (see the Base Definitions volume of IEEE Std. 1003.1-200x, |
9625 Chapter 8, Environment Variables). If this environment variable is not present, the results of the |
9626 search are implementation-defined. |

9627 If the process image file is not a valid executable object, *execlp*( ) and *execvp*( ) shall use the |
9628 contents of that file as standard input to a command interpreter conforming to *system*( ). In this |
9629 case, the command interpreter becomes the new process image.

9630 The arguments represented by *arg0*,... are pointers to null-terminated character strings. These
9631 strings constitute the argument list available to the new process image. The list is terminated by
9632 a null pointer. The argument *arg0* should point to a file name that is associated with the process

being started by one of the *exec* functions.

The argument *argv* is an array of character pointers to null-terminated strings. The application shall ensure that the last member of this array is a null pointer. These strings constitute the argument list available to the new process image. The value in *argv*[0] should point to a file name that is associated with the process being started by one of the *exec* functions.

The argument *envp* is an array of character pointers to null-terminated strings. These strings constitute the environment for the new process image. The *envp* array is terminated by a null pointer.

For those forms not containing an *envp* pointer (*execl*( ), *execv*( ), *execlp*( ), and *execvp*( )), the environment for the new process image is taken from the external variable *environ* in the calling process.

The number of bytes available for the new process' combined argument and environment lists is {ARG_MAX}. It is implementation-defined whether null terminators, pointers, and/or any alignment bytes are included in this total.

File descriptors open in the calling process image remain open in the new process image, except for those whose close-on-exec flag FD_CLOEXEC is set. For those file descriptors that remain open, all attributes of the open file description remain unchanged. For any file descriptor that is closed for this reason, file locks are removed as a result of the close as described in *close*( ). Locks that are not removed by closing of file descriptors remain unchanged.

Directory streams open in the calling process image shall be closed in the new process image.

XSI The state of conversion descriptors and message catalog descriptors in the new process image is undefined. For the new process, the equivalent of:

```
setlocale(LC_ALL, "C")
```

is executed at start-up.

Signals set to the default action (SIG_DFL) in the calling process image shall be set to the default action in the new process image. Signals set to be ignored (SIG_IGN) by the calling process image shall be set to be ignored by the new process image. Signals set to be caught by the calling
XSI process image shall be set to the default action in the new process image (see **<signal.h>**). After a successful call to any of the *exec* functions, alternate signal stacks are not preserved and the SA_ONSTACK flag shall be cleared for all signals.

After a successful call to any of the *exec* functions, any functions previously registered by *atexit*( ) are no longer registered.

XSI If the ST_NOSUID bit is set for the file system containing the new process image file, then the effective user ID, effective group ID, saved set-user-ID, and saved set-group-ID are unchanged in the new process image. Otherwise, if the set-user-ID mode bit of the new process image file is set, the effective user ID of the new process image is set to the user ID of the new process image file. Similarly, if the set-group-ID mode bit of the new process image file is set, the effective group ID of the new process image is set to the group ID of the new process image file. The real user ID, real group ID, and supplementary group IDs of the new process image remain the same as those of the calling process image. The effective user ID and effective group ID of the new process image shall be saved (as the saved set-user-ID and the saved set-group-ID) for use by *setuid*( ).

XSI Any shared memory segments attached to the calling process image shall not be attached to the new process image.

SEM Any named semaphores open in the calling process shall be closed as if by appropriate calls to *sem_close*( ).

TYM Any blocks of typed memory that were mapped in the calling process are unmapped, as if *munmap*( ) was implicitly called to unmap them.

ML Memory locks established by the calling process via calls to *mlockall*( ) or *mlock*( ) shall be removed. If locked pages in the address space of the calling process are also mapped into the address spaces of other processes and are locked by those processes, the locks established by the other processes shall be unaffected by the call by this process to the *exec* function. If the *exec* function fails, the effect on memory locks is unspecified.

MF|SHM Memory mappings created in the process are unmapped before the address space is rebuilt for the new process image.

PS For the SCHED_FIFO and SCHED_RR scheduling policies, the policy and priority settings shall not be changed by a call to an *exec* function. For other scheduling policies, the policy and priority settings on *exec* are implementation-defined.

TMR Per-process timers created by the calling process shall be deleted before replacing the current process image with the new process image.

MSG All open message queue descriptors in the calling process shall be closed, as described in *mq_close*( ).

AIO Any outstanding asynchronous I/O operations may be canceled. Those asynchronous I/O operations that are not canceled shall complete as if the *exec* function had not yet occurred, but any associated signal notifications shall be suppressed. It is unspecified whether the *exec* function itself blocks awaiting such I/O completion. In no event, however, shall the new process image created by the *exec* function be affected by the presence of outstanding asynchronous I/O operations at the time the *exec* function is called. Whether any I/O is canceled, and which I/O may be canceled upon *exec*, is implementation-defined.

CPT The new process image shall inherit the CPU-time clock of the calling process image. This inheritance means that the process CPU-time clock of the process being *exec*ed shall not be reinitialized or altered as a result of the *exec* function other than to reflect the time spent by the process executing the *exec* function itself.

TCT The initial value of the CPU-time clock of the initial thread of the new process image shall be set to zero.

TRC If the calling process is being traced, the new process image continues to be traced into the same trace stream as the original process image, but the new process image shall not inherit the mapping of trace event names to trace event type identifiers that was defined by calls to the *posix_trace_eventid_open*( ) or the *posix_trace_trid_eventid_open*( ) functions in the calling process image.

If the calling process is a trace controller process, any trace streams that were created by the calling process shall be shut down as described in the *posix_trace_shutdown*( ) function.

The new process also inherits at least the following attributes from the calling process image:

XSI • Nice value (see *nice*( ))

XSI • *semadj* values (see *semop*( ))

• Process ID

• Parent process ID

- Process group ID
- Session membership
- Real user ID
- Real group ID
- Supplementary group IDs
- Time left until an alarm clock signal (see *alarm*( ))
- Current working directory
- Root directory
- File mode creation mask (see *umask*( ))

XSI
- File size limit (see *ulimit*( ))

- Process signal mask (see *sigprocmask*( ))
- Pending signal (see *sigpending*( ))
- *tms_utime*, *tms_stime*, *tms_cutime*, and *tms_cstime* (see *times*( ))

XSI
- Resource limits

XSI
- Controlling terminal

XSI
- Interval timers

All other process attributes defined in this volume of IEEE Std. 1003.1-200x shall be the same in the new and old process images. The inheritance of process attributes not defined by this volume of IEEE Std. 1003.1-200x is implementation-defined.

A call to any *exec* function from a process with more than one thread results in all threads being terminated and the new executable image being loaded and executed. No destructor functions shall be called.

Upon successful completion, the *exec* functions shall mark for update the *st_atime* field of the file. If an *exec* function failed but was able to locate the *process image file*, whether the *st_atime* field is marked for update is unspecified. Should the *exec* function succeed, the process image file shall be considered to have been opened with *open*( ). The corresponding *close*( ) shall be considered to occur at a time after this open, but before process termination or successful completion of a subsequent call to one of the *exec* functions. The *argv*[ ] and *envp*[ ] arrays of pointers and the strings to which those arrays point shall not be modified by a call to one of the *exec* functions, except as a consequence of replacing the process image.

XSI The saved resource limits in the new process image are set to be a copy of the process' corresponding hard and soft limits.

RETURN VALUE

If one of the *exec* functions returns to the calling process image, an error has occurred; the return value shall be –1, and *errno* shall be set to indicate the error.

ERRORS

The *exec* functions shall fail if:

[E2BIG] The number of bytes used by the new process image's argument list and environment list is greater than the system-imposed limit of {ARG_MAX} bytes.

[EACCES] Search permission is denied for a directory listed in the new process image file's path prefix, or the new process image file denies execution permission, or the new process image file is not a regular file and the implementation does not support execution of files of its type.

[EINVAL] The new process image file has the appropriate permission and has a recognized executable binary format, but the system does not support execution of a file with this format.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* or *file* argument.

[ENAMETOOLONG] The length of the *path* or *file* arguments exceeds {PATH_MAX} or a path name component is longer than {NAME_MAX}.

[ENOENT] A component of *path* or *file* does not name an existing file or *path* or *file* is an empty string.

[ENOTDIR] A component of the new process image file's path prefix is not a directory.

The *exec* functions, except for *execlp*( ) and *execvp*( ), shall fail if:

[ENOEXEC] The new process image file has the appropriate access permission but has an unrecognized format.

The *exec* functions may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* or *file* argument.

[ENAMETOOLONG] As a result of encountering a symbolic link in resolution of the *path* argument, the length of the substituted path name string exceeded {PATH_MAX}.

[ENOMEM] The new process image requires more memory than is allowed by the hardware or system-imposed memory management constraints.

[ETXTBSY] The new process image file is a pure procedure (shared text) file that is currently open for writing by some process.

EXAMPLES

Using execl( )

The following example executes the *ls* command, specifying the path name of the executable (**/bin/ls**) and using arguments supplied directly to the command to produce single-column output.

```
#include <unistd.h>

int ret;
...
ret = execl ("/bin/ls", "ls", "-1", NULL);
```

Using execle()

The following example is similar to **Using execl()** (on page 794). In addition, it specifies the environment for the new process image using the *env* argument.

```
#include <unistd.h>

int ret;
char *env[] = { "HOME=/usr/home", "LOGNAME=home", NULL };
...
ret = execle ("/bin/ls", "ls", "-l", NULL, env);
```

Using execlp()

The following example searches for the location of the *ls* command among the directories specified by the *PATH* environment variable.

```
#include <unistd.h>

int ret;
...
ret = execlp ("ls", "ls", "-l", NULL);
```

Using execv()

The following example passes arguments to the *ls* command in the *cmd* array.

```
#include <unistd.h>

int ret;
char *cmd[] = { "ls", "-l", NULL };
...
ret = execv ("/bin/ls", cmd);
```

Using execve()

The following example passes arguments to the *ls* command in the *cmd* array, and specifies the environment for the new process image using the *env* argument.

```
#include <unistd.h>

int ret;
char *cmd[] = { "ls", "-l", NULL };
char *env[] = { "HOME=/usr/home", "LOGNAME=home", NULL };
...
ret = execve ("/bin/ls", cmd, env);
```

Using execvp()

The following example searches for the location of the *ls* command among the directories specified by the *PATH* environment variable, and passes arguments to the *ls* command in the *cmd* array.

```
#include <unistd.h>

int ret;
char *cmd[] = { "ls", "-l", NULL };
...
```

```
ret = execvp ("ls", cmd);
```

APPLICATION USAGE

As the state of conversion descriptors and message catalog descriptors in the new process image is undefined, portable applications should not rely on their use and should close them prior to calling one of the *exec* functions.

Applications that require other than the default POSIX locale should call *setlocale*( ) with the appropriate parameters to establish the locale of the new process.

The *environ* array should not be accessed directly by the application.

RATIONALE

Early proposals required that the value of *argc* passed to *main*( ) be ''one or greater''. This was driven by the same requirement in drafts of the ISO C standard. In fact, historical implementations have passed a value of zero when no arguments are supplied to the caller of the *exec* functions. This requirement was removed from the ISO C standard and subsequently removed from this volume of IEEE Std. 1003.1-200x as well. The wording, in particular the use of the word *should*, requires a Strictly Conforming POSIX Application to pass at least one argument to the *exec* function, thus guaranteeing that *argc* be one or greater when invoked by such an application. In fact, this is good practice, since many existing applications reference *argv*[0] without first checking the value of *argc*.

The requirement on a Strictly Conforming POSIX Application also states that the value passed as the first argument be a file name associated with the process being started. Although some existing applications pass a path name rather than a file name in some circumstances, a file name is more generally useful, since the common usage of *argv*[0] is in printing diagnostics. In some cases the file name passed is not the actual file name of the file; for example, many implementations of the *login* utility use a convention of prefixing a hyphen ('−') to the actual file name, which indicates to the command interpreter being invoked that it is a ''login shell''.

Some systems can *exec* shell scripts.

One common historical implementation is that the *execl*( ), *execv*( ), *execle*( ), and *execve*( ) functions return an [ENOEXEC] error for any file not recognizable as executable, including a shell script. When the *execlp*( ) and *execvp*( ) functions encounter such a file, they assume the file to be a shell script and invoke a known command interpreter to interpret such files. These implementations of *execvp*( ) and *execlp*( ) only give the [ENOEXEC] error in the rare case of a problem with the command interpreter's executable file. Because of these implementations, the [ENOEXEC] error is not mentioned for *execlp*( ) or *execvp*( ), although implementations can still give it.

Another way that some historical implementations handle shell scripts is by recognizing the first two bytes of the file as the character string "#!" and using the remainder of the first line of the file as the name of the command interpreter to execute.

Some implementations provide a third argument to *main*( ) called *envp*. This is defined as a pointer to the environment. The ISO C standard specifies invoking *main*( ) with two arguments, so implementations must support applications written this way. Since this volume of IEEE Std. 1003.1-200x defines the global variable *environ*, which is also provided by historical implementations and can be used anywhere that *envp* could be used, there is no functional need for the *envp* argument. Applications should use the *getenv*( ) function rather than accessing the environment directly via either *envp* or *environ*. Implementations are required to support the two-argument calling sequence, but this does not prohibit an implementation from supporting *envp* as an optional third argument.

This volume of IEEE Std. 1003.1-200x specifies that signals set to SIG_IGN remain set to SIG_IGN, and that the process signal mask be unchanged across an *exec*. This is consistent with historical implementations, and it permits some useful functionality, such as the *nohup* command. However, it should be noted that many existing applications wrongly assume that they start with certain signals set to the default action and/or unblocked. In particular, applications written with a simpler signal model that does not include blocking of signals, such as the one in the ISO C standard, may not behave properly if invoked with some signals blocked. Therefore, it is best not to block or ignore signals across *exec*s without explicit reason to do so, and especially not to block signals across *exec*s of arbitrary (not closely co-operating) programs.

The *exec* functions always save the value of the effective user ID and effective group ID of the process at the completion of the *exec*, whether or not the set-user-ID or the set-group-ID bit of the process image file is set.

The statement about *argv*[ ] and *envp*[ ] being constants is included to make explicit to future writers of language bindings that these objects are completely constant. Due to a limitation of the ISO C standard, it is not possible to state that idea in standard C. Specifying two levels of *const–qualification* for the *argv*[ ] and *envp*[ ] parameters for the *exec* functions may seem to be the natural choice, given that these functions do not modify either the array of pointers or the characters to which the function points, but this would disallow existing correct code. Instead, only the array of pointers is noted as constant. The table of assignment compatibility for *dst=src*, derived from the ISO C standard summarizes the compatibility:

dst:	**char *[ ]**	**const char *[ ]**	**char *const[ ]**	**const char *const[ ]**
src:				
char *[ ]	VALID	—	VALID	—
const char *[ ]	—	VALID	—	VALID
char * const [ ]	—	—	VALID	—
const char *const[ ]	—	—	—	VALID

Since all existing code has a source type matching the first row, the column that gives the most valid combinations is the third column. The only other possibility is the fourth column, but using it would require a cast on the *argv* or *envp* arguments. It is unfortunate that the fourth column cannot be used, because the declaration a non-expert would naturally use would be that in the second row.

The ISO C standard and this volume of IEEE Std. 1003.1-200x do not conflict on the use of *environ*, but some historical implementations of *environ* may cause a conflict. As long as *environ* is treated in the same way as an entry point (for example, *fork*( )), it conforms to both standards. A library can contain *fork*( ), but if there is a user-provided *fork*( ), that *fork*( ) is given precedence and no problem ensues. The situation is similar for *environ*: the definition in this volume of IEEE Std. 1003.1-200x is to be used if there is no user-provided *environ* to take precedence. At least three implementations are known to exist that solve this problem.

[E2BIG] The limit {ARG_MAX} applies not just to the size of the argument list, but to the sum of that and the size of the environment list.

[EFAULT] Some historical systems return [EFAULT] rather than [ENOEXEC] when the new process image file is corrupted. They are non-conforming.

[EINVAL] This error condition was added to IEEE Std. 1003.1-200x to allow an implementation to detect executable files generated for different architectures, and indicate this situation to the application. Historical implementations of shells, *execvp*( ), and *execlp*( ) that encounter an [ENOEXEC] error will execute a shell on the assumption that the file is a shell script. This will not produce the desired effect when the file is a valid executable for a different

architecture. An implementation may now choose to avoid this problem by returning [EINVAL] when a valid executable for a different architecture is encountered. Some historical implementations return [EINVAL] to indicate that the *path* argument contains a character with the high order bit set. The standard developers chose to deviate from historical practice for the following reasons:

1. The new utilization of [EINVAL] will provide some measure of utility to the user community.
2. Historical use of [EINVAL] is not acceptable in an internationalized operating environment.

[ENAMETOOLONG] Since the file path name may be constructed by taking elements in the *PATH* variable and putting them together with the file name, the [ENAMETOOLONG] error condition could also be reached this way.

[ETXTBSY] System V returns this error when the executable file is currently open for writing by some process. This volume of IEEE Std. 1003.1-200x neither requires nor prohibits this behavior.

Other systems (such as System V) may return [EINTR] from *exec*. This is not addressed by this volume of IEEE Std. 1003.1-200x, but implementations may have a window between the call to *exec* and the time that a signal could cause one of the *exec* calls to return with [EINTR].

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The **<unistd.h>** header is added to the SYNOPSIS section.

The **const** keyword is added to identifiers of constant type (for example, *path*, *file*).

In the DESCRIPTION:

- An indication of the disposition of conversion descriptors after a call to one of the *exec* functions is added.
- A statement about the interaction between *exec* and *atexit*( ) is added.
- *usually* in the descriptions of argument pointers is removed.
- *owner ID* is changed to *user ID*.
- Shared memory is no longer optional.
- The penultimate paragraph is changed to correct an error in Issue 3. It now refers to ‘‘All other process attributes ...’’ instead of ‘‘All the process attributes ...’’

A note about the initialization of locales is added to the APPLICATION USAGE section.

The following change is incorporated for alignment with the ISO POSIX-1 standard:

- In the ERRORS section, the description of the [ENOEXEC] error is changed to indicate that this error does not apply to *execlp*( ) and *execvp*( ), and the [ENOMEM] error is added.

The following change is incorporated for alignment with the FIPS requirements:

- In the ERRORS section, the condition whereby [ENAMETOOLONG] is returned if a path name component is larger that {NAME_MAX} is now defined as mandatory and marked as an extension.

Issue 4, Version 2

The following changes are incorporated for X/OPEN UNIX conformance:

- The DESCRIPTION is changed:
  - — To indicate the disposition of alternate signal stacks, the SA_ONSTACK flag, and mappings established through *mmap*( ) after a successful call to one of the *exec* functions.
  - — The effects of ST_NOSUID being set for a file system are defined.
  - — A statement is added that mappings established through *mmap*( ) are not preserved across an *exec*.
  - — The list of inherited process attributes is extended to include resource limits, the controlling terminal, and interval timers.
- In the ERRORS section:
  - — The condition whereby [ELOOP] is returned if too many symbolic links are encountered during path name resolution is defined as mandatory.
  - — A second [ENAMETOOLONG] condition is defined that may report excessive length of an intermediate result of path name resolution of a symbolic link.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Large File Summit extensions are added.

Issue 6

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The [ENAMETOOLONG] error is restored as an error dependent on _POSIX_NO_TRUNC. This is since behavior may vary from one file system to another.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, behavior is defined for when the process image file is not a valid executable.
- In this issue, _POSIX_SAVED_IDS is mandated, thus the effective user ID and effective group ID of the new process image shall be saved (as the saved set-user-ID and the saved set-group-ID) for use by the *setuid*( ) function.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

- The [ETXTBSY] optional error condition is added.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [EINVAL] mandatory error condition is added.
- The [ELOOP] optional error condition is added.

The description of CPU-time clock semantics is added for alignment with IEEE Std. 1003.1d-1999.

The DESCRIPTION is updated for alignment with IEEE Std. 1003.1j-2000 by adding semantics for typed memory.

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements. |

The description of tracing semantics is added for alignment with IEEE Std. 1003.1q-2000. |

NAME

exit, _Exit, _exit — terminate a process

SYNOPSIS

```
#include <stdlib.h>

void exit(int status);

#include <unistd.h>

void _Exit(int status);
void _exit(int status);
```

DESCRIPTION

CX The functionality described on this reference page for the *exit*() function is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard are unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

The *exit*() function shall first call all functions registered by *atexit*(), in the reverse order of their registration, except that a function is called after any previously registered functions that had already been called at the time it was registered. Each function is called as many times as it was registered. If, during the call to any such function, a call to the *longjmp*() function is made that would terminate the call to the registered function, the behavior is undefined.

If a function registered by a call to *atexit*() fails to return, the remaining registered functions shall not be called and the rest of the *exit*() processing shall not be completed. If *exit*() is called more than once, the effects are undefined.

CX The *exit*() function then flushes all output streams, closes all open streams, and removes all files created by *tmpfile*(). Finally, control is returned to the host environment as described below. The values of *status* can be EXIT_SUCCESS or EXIT_FAILURE, as described in **<stdlib.h>**, or any CX implementation-defined value, although note that only the range 0 through 255 shall be available to a waiting parent process.

The *_Exit*() and *_exit*() functions shall be functionally identical.

CX The *_Exit*(), *_exit*(), and *exit*() functions shall terminate the calling process with the following consequences:

- XSI All of the file descriptors, directory streams, conversion descriptors, and message catalog descriptors open in the calling process are closed.
- XSI If the parent process of the calling process is executing a *wait*(), *waitid*(), or *waitpid*(), and has neither set its SA_NOCLDWAIT flag nor set SIGCHLD to SIG_IGN, it is notified of the calling process' termination and the low-order eight bits (that is, bits 0377) of *status* are made available to it. If the parent is not waiting, the child's status shall be made available to it when the parent subsequently executes *wait*(), *waitid*(), or *waitpid*(). XSI
- XSI If the parent process of the calling process is not executing a *wait*(), *waitid*(), or *waitpid*(), and has not set its SA_NOCLDWAIT flag, or set SIGCHLD to SIG_IGN, the calling process is transformed into a *zombie process*. A *zombie process* is an inactive process and it shall be deleted at some later time when its parent process executes *wait*(), *waitid*(), or *waitpid*(). XSI
- Termination of a process does not directly terminate its children. The sending of a SIGHUP signal as described below indirectly terminates children in some circumstances.
- If the implementation supports the SIGCHLD signal, a SIGCHLD shall be sent to the parent process.

XSI
- If the parent process has set its SA_NOCLDWAIT flag, or set SIGCHLD to SIG_IGN, the status shall be discarded, and the lifetime of the calling process shall end immediately. If SA_NOCLDWAIT is set, it is implementation-defined whether a SIGCHLD signal shall be sent to the parent process.

- The parent process ID of all of the calling process' existing child processes and zombie processes is set to the process ID of an implementation-defined system process. That is, these processes are inherited by a special system process.

XSI
- Each attached shared-memory segment is detached and the value of *shm_nattch* (see *shmget*( )) in the data structure associated with its shared memory ID is decremented by 1.

XSI
- For each semaphore for which the calling process has set a *semadj* value (see *semop*( )), that value is added to the *semval* of the specified semaphore.

- If the process is a controlling process, the SIGHUP signal shall be sent to each process in the foreground process group of the controlling terminal belonging to the calling process.

- If the process is a controlling process, the controlling terminal associated with the session is disassociated from the session, allowing it to be acquired by a new controlling process.

- If the exit of the process causes a process group to become orphaned, and if any member of the newly-orphaned process group is stopped, then a SIGHUP signal followed by a SIGCONT signal shall be sent to each process in the newly-orphaned process group.

SEM
- All open named semaphores in the calling process shall be closed as if by appropriate calls to *sem_close*( ).

ML
- Any memory locks established by the process via calls to *mlockall*( ) or *mlock*( ) shall be removed. If locked pages in the address space of the calling process are also mapped into the address spaces of other processes and are locked by those processes, the locks established by the other processes shall be unaffected by the call by this process to *_Exit*( ) or *_exit*( ).

MF|SHM
- Memory mappings created in the process are unmapped before the process is destroyed.

TYM
- Any blocks of typed memory that were mapped in the calling process are unmapped, as if *munmap*( ) was implicitly called to unmap them.

MSG
- All open message queue descriptors in the calling process shall be closed as if by appropriate calls to *mq_close*( ).

AIO
- Any outstanding cancelable asynchronous I/O operations may be canceled. Those asynchronous I/O operations that are not canceled shall complete as if the *_Exit*( ) or *_exit*( ) operation had not yet occurred, but any associated signal notifications shall be suppressed. The *_Exit*( ) or *_exit*( ) operation may block awaiting such I/O completion. Whether any I/O is canceled, and which I/O may be canceled upon *_Exit*( ) or *_exit*( ), is implementation-defined.

- Threads terminated by a call to *_Exit*( ) or *_exit*( ) shall not invoke their cancelation cleanup handlers or per-thread data destructors.

TRC
If the calling process is a trace controller process, any trace streams that were created by the calling process shall be shut down as described by the *posix_trace_shutdown*( ) function, and any process' mapping of trace event names to trace event type identifiers built for these trace streams may be deallocated.

RETURN VALUE

These functions do not return.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

Normally applications should use *exit*( ) rather than *_Exit*( ) or *_exit*( ).

RATIONALE

Process Termination

Early proposals drew a different distinction between normal and abnormal process termination. Abnormal termination was caused only by certain signals and resulted in implementation-defined ''actions'', as discussed below. Subsequent proposals distinguished three types of termination: *normal termination* (as in the current specification), *simple abnormal termination*, and *abnormal termination with actions*. Again the distinction between the two types of abnormal termination was that they were caused by different signals and that implementation-defined actions would result in the latter case. Given that these actions were completely implementation-defined, the early proposals were only saying when the actions could occur and how their occurrence could be detected, but not what they were. This was of little or no use to portable applications, and thus the distinction is not made in this volume of IEEE Std. 1003.1-200x.

The implementation-defined actions usually include, in most historical implementations, the creation of a file named **core** in the current working directory of the process. This file contains an image of the memory of the process, together with descriptive information about the process, perhaps sufficient to reconstruct the state of the process at the receipt of the signal.

There is a potential security problem in creating a **core** file if the process was set-user-ID and the current user is not the owner of the program, if the process was set-group-ID and none of the user's groups match the group of the program, or if the user does not have permission to write in the current directory. In this situation, an implementation either should not create a **core** file or should make it unreadable by the user.

Despite the silence of this volume of IEEE Std. 1003.1-200x on this feature, applications are advised not to create files named **core** because of potential conflicts in many implementations. Some historical implementations use a different name than **core** for the file, such as by appending the process ID to the file name.

Terminating a Process

It is important that the consequences of process termination as described occur regardless of whether the process called *_exit*( ) (perhaps indirectly through *exit*( )) or instead was terminated due to a signal or for some other reason. Note that in the specific case of *exit*( ) this means that the *status* argument to *exit*( ) is treated the same as the *status* argument to *_exit*( ).

A language other than C may have other termination primitives than the C-language *exit*( ) function, and programs written in such a language should use its native termination primitives, but those should have as part of their function the behavior of *_exit*( ) as described. Implementations in languages other than C are outside the scope of the present version of this volume of IEEE Std. 1003.1-200x, however.

As required by the ISO C standard, using **return** from *main*( ) is equivalent to calling *exit*( ) with the same argument value. Also, reaching the end of the *main*( ) function is equivalent to using *exit*( ) with an unspecified value.

A value of zero (or EXIT_SUCCESS, which is required to be zero) for the argument *status* conventionally indicates successful termination. This corresponds to the specification for *exit*( ) in the ISO C standard. The convention is followed by utilities such as *make* and various shells, which interpret a zero status from a child process as success. For this reason, applications should not call *exit*(0) or *_exit*(0) when they terminate unsuccessfully; for example, in signal-catching functions.

Historically, the implementation-defined process that inherits children whose parents have terminated without waiting on them is called *init* and has a process ID of 1.

The sending of a SIGHUP to the foreground process group when a controlling process terminates corresponds to somewhat different historical implementations. In System V, the kernel sends a SIGHUP on termination of (essentially) a controlling process. In 4.2 BSD, the kernel does not send SIGHUP in a case like this, but the termination of a controlling process is usually noticed by a system daemon, which arranges to send a SIGHUP to the foreground process group with the *vhangup*( ) function. However, in 4.2 BSD, due to the behavior of the shells that support job control, the controlling process is usually a shell with no other processes in its process group. Thus, a change to make *_exit*( ) behave this way in such systems should not cause problems with existing applications.

The termination of a process may cause a process group to become orphaned in either of two ways. The connection of a process group to its parent(s) outside of the group depends on both the parents and their children. Thus, a process group may be orphaned by the termination of the last connecting parent process outside of the group or by the termination of the last direct descendant of the parent process(es). In either case, if the termination of a process causes a process group to become orphaned, processes within the group are disconnected from their job control shell, which no longer has any information on the existence of the process group. Stopped processes within the group would languish forever. In order to avoid this problem, newly orphaned process groups that contain stopped processes are sent a SIGHUP signal and a SIGCONT signal to indicate that they have been disconnected from their session. The SIGHUP signal causes the process group members to terminate unless they are catching or ignoring SIGHUP. Under most circumstances, all of the members of the process group are stopped if any of them are stopped.

The action of sending a SIGHUP and a SIGCONT signal to members of a newly orphaned process group is similar to the action of 4.2 BSD, which sends SIGHUP and SIGCONT to each stopped child of an exiting process. If such children exit in response to the SIGHUP, any additional descendants receive similar treatment at that time. In this volume of IEEE Std. 1003.1-200x, the signals are sent to the entire process group at the same time. Also, in this volume of IEEE Std. 1003.1-200x, but not in 4.2 BSD, stopped processes may be orphaned, but may be members of a process group that is not orphaned; therefore, the action taken at *_exit*( ) must consider processes other than child processes.

It is possible for a process group to be orphaned by a call to *setpgid*( ) or *setsid*( ), as well as by process termination. This volume of IEEE Std. 1003.1-200x does not require sending SIGHUP and SIGCONT in those cases, because, unlike process termination, those cases are not caused accidentally by applications that are unaware of job control. An implementation can choose to send SIGHUP and SIGCONT in those cases as an extension; such an extension must be documented as required in **<signal.h>**.

The ISO/IEC 9899:1999 standard adds the *_Exit*( ) function that results in immediate program termination without triggering signals or *atexit*( )-registered functions. In IEEE Std. 1003.1-200x,

this is equivalent to the *_exit*( ) function.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The **<unistd.h>** header is added to the SYNOPSIS for *_exit*( ).

In the DESCRIPTION, text is added describing the behavior when a function registered by *atexit*( ) fails to return, and the consequences of calling *exit*( ) more than once.

The phrase ''If the implementation supports job control'' is removed from the last bullet in the DESCRIPTION. This is because job control is now defined as mandatory for all conforming implementations.

The following change is incorporated for alignment with the ISO C standard:

- In the DESCRIPTION, interactions between *exit*( ) and *atexit*( ) are defined, and it is now stated explicitly that all files created by *tmpfile*( ) are removed.

Issue 4, Version 2

The following changes to the DESCRIPTION are incorporated for X/OPEN UNIX conformance:

- References to the functions *wait3*( ) and *waitid*( ) are added in appropriate places throughout the text.
- Interactions with the SA_NOCLDWAIT flag and SIGCHLD signal are defined.
- It is specified that each mapped memory object is unmapped.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Interactions with the SA_NOCLDWAIT flag and SIGCHLD signal are further clarified.

The values of *status* from *exit*( ) are better described.

Issue 6

Extensions beyond the ISO C standard are now marked.

The DESCRIPTION is updated for alignment with IEEE Std. 1003.1j-2000 by adding semantics for typed memory.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The *_Exit*( ) function is included.
- The DESCRIPTION is updated.

The description of tracing semantics is added for alignment with IEEE Std. 1003.1q-2000.

References to the *wait3*( ) function are removed.

10239 **NAME**

10240 exp, expf, expl — exponential function

10241 **SYNOPSIS**

10242
```
#include <math.h>
```

10243
```
double exp(double x);
```
10244
```
float expf(float x);
```
10245
```
long double expl(long double x);
```

10246 **DESCRIPTION**

10247 CX The functionality described on this reference page is aligned with the ISO C standard. Any
10248 conflict between the requirements described here and the ISO C standard is unintentional. This
10249 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

10250 These functions shall compute the exponent of x, defined as e^x.

10251 An application wishing to check for error situations should set *errno* to 0 before calling *exp*( ). If
10252 *errno* is non-zero on return, or the return value is NaN, an error has occurred.

10253 **RETURN VALUE**

10254 Upon successful completion, these functions shall return the exponential value of x.

10255 If the correct value would cause overflow, *exp*( ) shall return HUGE_VAL and set *errno* to
10256 [ERANGE].

10257 If the correct value would cause underflow, *exp*( ) shall return 0 and may set *errno* to [ERANGE].

10258 XSI If x is NaN, NaN shall be returned and *errno* may be set to [EDOM].

10259 **ERRORS**

10260 These functions shall fail if:

10261 [ERANGE] The result overflows.

10262 These functions may fail if:

10263 XSI [EDOM] The value of x is NaN.

10264 [ERANGE] The result underflows

10265 XSI No other errors shall occur.

10266 **EXAMPLES**

10267 None.

10268 **APPLICATION USAGE**

10269 None.

10270 **RATIONALE**

10271 None.

10272 **FUTURE DIRECTIONS**

10273 None.

10274 **SEE ALSO**

10275 *isnan*( ), *log*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<math.h>**

10276 **CHANGE HISTORY**

10277 First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

References to *matherr*( ) are removed.

The RETURN VALUE and ERRORS sections are substantially rewritten for alignment with the ISO C standard and to rationalize error handling in the mathematics functions.

The return value specified for [EDOM] is marked as an extension.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *expf*( ) and *expl*( ) functions are added for alignment with the ISO / IEC 9899: 1999 standard.

10288 **NAME**

10289 exp2, exp2f, exp2l — exponential base 2 functions

10290 **SYNOPSIS**

10291
```
#include <math.h>
```

10292
```
double exp2(double x);
```
10293
```
float exp2f(float x);
```
10294
```
long double exp2l(long double x);
```

10295 **DESCRIPTION**

10296 CX The functionality described on this reference page is aligned with the ISO C standard. Any
10297 conflict between the requirements described here and the ISO C standard is unintentional. This
10298 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

10299 These functions shall compute the base 2 exponent of *x*, defined as e^x.

10300 An application wishing to check for error situations should set *errno* to 0 before calling these
10301 functions. If *errno* is non-zero on return, or the return value is NaN, an error has occurred.

10302 **RETURN VALUE**

10303 Upon successful completion, these functions shall return 2^x.

10304 If the correct value would cause overflow, these functions shall return HUGE_VAL and set *errno*
10305 to [ERANGE].

10306 If the correct value would cause underflow, these functions shall return 0 and may set *errno* to
10307 [ERANGE].

10308 If *x* is NaN, NaN shall be returned and *errno* may be set to [EDOM].

10309 **ERRORS**

10310 These functions shall fail if:

10311 [ERANGE] The result overflows.

10312 These functions may fail if:

10313 [EDOM] The value of *x* is NaN.

10314 [ERANGE] The result underflows

10315 No other errors shall occur.

10316 **EXAMPLES**

10317 None.

10318 **APPLICATION USAGE**

10319 None.

10320 **RATIONALE**

10321 None.

10322 **FUTURE DIRECTIONS**

10323 None.

10324 **SEE ALSO**

10325 *exp*( ), *isnan*( ), *log*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<math.h>**

10326 **CHANGE HISTORY**
10327 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

10328 **NAME**

10329 expm1, expm1f, expm1l — compute exponential functions

10330 **SYNOPSIS**

10331 `#include <math.h>`

10332 `double expm1(double x);`
10333 `float expm1f(float x);`
10334 `long double expm1l(long double x);`

10335 **DESCRIPTION**

10336 These functions shall compute e^x–1.0.

10337 **RETURN VALUE**

10338 If *x* is NaN, then these functions shall return NaN and *errno* may be set to [EDOM].

10339 If *x* is positive infinity, these functions shall return positive infinity.

10340 If *x* is negative infinity, these functions shall return –1.0.

10341 If the value overflows, these functions shall return HUGE_VAL and may set *errno* to [ERANGE].

10342 **ERRORS**

10343 These functions may fail if:

10344 [EDOM] The value of *x* is NaN.

10345 [ERANGE] The result overflows.

10346 **EXAMPLES**

10347 None.

10348 **APPLICATION USAGE**

10349 The value of *expm1*(*x*) may be more accurate than *exp*(*x*)–1.0 for small values of *x*.

10350 The *expm1*( ) and *log1p*( ) functions are useful for financial calculations of $((1+x)^n-1)/x$, namely:

10351 expm1(*n* * log1p(*x*))/*x*

10352 when *x* is very small (for example, when calculating small daily interest rates). These functions
10353 also simplify writing accurate inverse hyperbolic functions.

10354 **RATIONALE**

10355 None.

10356 **FUTURE DIRECTIONS**

10357 None.

10358 **SEE ALSO**

10359 *exp*( ), *ilogb*( ), *log1p*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<math.h>**

10364 **Issue 6**

10365 The *expm1f*( ) and *expm1l*( ) functions are added for alignment with the ISO/IEC 9899:1999
10366 standard.

10367 **NAME**

10368 fabs, fabsf, fabsl — absolute value function

10369 **SYNOPSIS**

10370
```
#include <math.h>
```

10371
```
double fabs(double x);
```
10372
```
float fabsf(float x);
```
10373
```
long double fabsl(long double x);
```

10374 **DESCRIPTION**

10375 CX The functionality described on this reference page is aligned with the ISO C standard. Any
10376 conflict between the requirements described here and the ISO C standard is unintentional. This
10377 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

10378 These functions shall compute the absolute value of x, $|x|$.

10379 An application wishing to check for error situations should set *errno* to 0 before calling *fabs*( ). If
10380 *errno* is non-zero on return, or the return value is NaN, an error has occurred.

10381 **RETURN VALUE**

10382 Upon successful completion, these functions shall return the absolute value of x.

10383 XSI If x is NaN, NaN shall be returned and *errno* may be set to [EDOM].

10384 If the result underflows, 0 shall be returned and *errno* may be set to [ERANGE].

10385 **ERRORS**

10386 These functions may fail if:

10387 XSI [EDOM] The value of x is NaN.

10388 [ERANGE] The result underflows

10389 XSI No other errors shall occur.

10390 **EXAMPLES**

10391 None.

10392 **APPLICATION USAGE**

10393 None.

10394 **RATIONALE**

10395 None.

10400 **CHANGE HISTORY**

10401 First released in Issue 1. Derived from Issue 1 of the SVID.

10402 **Issue 4**

10403 References to *matherr*( ) are removed.

10404 The RETURN VALUE and ERRORS sections are substantially rewritten for alignment with the
10405 ISO C standard and to rationalize error handling in the mathematics functions.

10406 The return value specified for [EDOM] is marked as an extension.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *fabsf*( ) and *fabsl*( ) functions are added for alignment with the ISO / IEC 9899: 1999 standard.

NAME

fattach — attach a STREAMS-based file descriptor to a file in the file system name space (**STREAMS**)

SYNOPSIS

XSR
```
#include <stropts.h>

int fattach(int fildes, const char *path);
```

DESCRIPTION

Notes to Reviewers

This section with side shading will not appear in the final copy. - Ed.

Re D1, XSH, ERN 111: if the original file had multiple links, the streams file still has only one? I presume that a stream is actually attached to an inode, not a file name. If so, there continue to exist multiple links to the object, even though it shows a link count of 1. If it associated the stream with a file name, then the following sentence is wrong.

The *fattach*( ) function attaches a STREAMS-based file descriptor to a file, effectively associating a path name with *fildes*. The application shall ensure that the *fildes* argument is a valid open file descriptor associated with a STREAMS file. The *path* argument points to a path name of an existing file. The application shall ensure that the process has appropriate privileges, or is the owner of the file named by *path* and has write permission. A successful call to *fattach*( ) shall cause all path names that name the file named by *path* to name the STREAMS file associated with *fildes*, until the STREAMS file is detached from the file. A STREAMS file can be attached to more than one file and can have several path names associated with it.

The attributes of the named STREAMS file shall be initialized as follows: the permissions, user ID, group ID, and times are set to those of the file named by *path*, the number of links is set to 1, and the size and device identifier are set to those of the STREAMS file associated with *fildes*. If any attributes of the named STREAMS file are subsequently changed (for example, by *chmod*( )), neither the attributes of the underlying file nor the attributes of the STREAMS file to which *fildes* refers shall be affected.

File descriptors referring to the underlying file, opened prior to an *fattach*( ) call, shall continue to refer to the underlying file.

RETURN VALUE

Upon successful completion, *fattach*( ) shall return 0. Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *fattach*( ) function shall fail if:

[EACCES] Search permission is denied for a component of the path prefix, or the process is the owner of *path* but does not have write permissions on the file named by *path*.

[EBADF] The *fildes* argument is not a valid open file descriptor.

[EBUSY] The file named by *path* is currently a mount point or has a STREAMS file attached to it.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The size of *path* exceeds {PATH_MAX} or a component of *path* is longer than {NAME_MAX}.

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

[ENOTDIR] A component of the path prefix is not a directory.

[EPERM] The effective user ID of the process is not the owner of the file named by *path* and the process does not have appropriate privilege.

The *fattach*( ) function may fail if:

[EINVAL] The *fildes* argument does not refer to a STREAMS file.

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
Path name resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}.

[EXDEV] A link to a file on another file system was attempted.

EXAMPLES

Attaching a File Descriptor to a File

In the following example, *fd* refers to an open STREAMS file. The call to *fattach*( ) associates this STREAM with the file **/tmp/named-STREAM**, such that any future calls to open **/tmp/named-STREAM**, prior to breaking the attachment via a call to *fdetach*( ), will instead create a new file handle referring to the STREAMS file associated with *fd*.

```
#include <stropts.h>
...
    int fd;
    char *filename = "/tmp/named-STREAM";
    int ret;

    ret = fattach(fd, filename);
```

APPLICATION USAGE

The *fattach*( ) function behaves similarly to the traditional *mount*( ) function in the way a file is temporarily replaced by the root directory of the mounted file system. In the case of *fattach*( ), the replaced file need not be a directory and the replacing file is a STREAMS file.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The [EXDEV] error is added to the list of optional errors in the ERRORS section.

Issue 6

This function is marked as part of the XSI STREAMS Option Group.

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

10502 **NAME**

10503 fchdir — change working directory

10504 **SYNOPSIS**

10505 XSI
```
#include <unistd.h>

int fchdir(int fildes);
```
10506

10507

10508 **DESCRIPTION**

10509 The *fchdir*( ) function has the same effect as *chdir*( ) except that the directory that is to be the new
10510 current working directory is specified by the file descriptor *fildes*.

10511 **RETURN VALUE**

10512 Upon successful completion, *fchdir*( ) shall return 0. Otherwise, it shall return –1 and set *errno* to
10513 indicate the error. On failure the current working directory shall remain unchanged.

10514 **ERRORS**

10515 The *fchdir*( ) function shall fail if:

10516 [EACCES] Search permission is denied for the directory referenced by *fildes*.

10517 [EBADF] The *fildes* argument is not an open file descriptor.

10518 [ENOTDIR] The open file descriptor *fildes* does not refer to a directory.

10519 The *fchdir*( ) may fail if:

10520 [EINTR] A signal was caught during the execution of *fchdir*( ).

10521 [EIO] An I/O error occurred while reading from or writing to the file system.

10522 **EXAMPLES**

10523 None.

10524 **APPLICATION USAGE**

10525 None.

10526 **RATIONALE**

10527 None.

10528 **FUTURE DIRECTIONS**

10529 None.

10531 *chdir*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<unistd.h>**

10532 **CHANGE HISTORY**

10533 First released in Issue 4, Version 2.

10534 **Issue 5**

10535 Moved from X/OPEN UNIX extension to BASE.

10536 **NAME**

10537 fchmod — change mode of a file

10538 **SYNOPSIS**

10539 `#include <sys/stat.h>`

10540 `int fchmod(int fildes, mode_t mode);`

10541 **DESCRIPTION**

10542 The *fchmod*( ) function has the same effect as *chmod*( ) except that the file whose permissions are
10543 changed is specified by the file descriptor *fildes*.

10544 SHM If *fildes* references a shared memory object, the *fchmod*( ) function need only affect the S_IRUSR,
10545 S_IWUSR, S_IRGRP, S_IWGRP, S_IROTH, and S_IWOTH file permission bits.

10546 TYM If *fildes* references a typed memory object, the behavior of *fchmod*( ) is unspecified. |

10547 ***Notes to Reviewers*** |

10548 *This section with side shading will not appear in the final copy. - Ed.* |

10549 D3, XSH, ERN 178 suggests adding text as follows: "If fildes refers to a STREAM (which is |
10550 fattached() into the file system name space) the call returns successfully, doing nothing. If fildes |
10551 refers to a stream, <do what?>." |

10552 **RETURN VALUE** |

10553 Upon successful completion, *fchmod*( ) shall return 0. Otherwise, it shall return –1 and set *errno* to
10554 indicate the error.

10555 **ERRORS**

10556 The *fchmod*( ) function shall fail if:

10557 [EBADF] The *fildes* argument is not an open file descriptor. |

10558 [EPERM] The effective user ID does not match the owner of the file and the process |
10559 does not have appropriate privilege.

10560 [EROFS] The file referred to by *fildes* resides on a read-only file system. |

10561 The *fchmod*( ) function may fail if:

10562 XSI [EINTR] The *fchmod*( ) function was interrupted by a signal. |

10563 XSI [EINVAL] The value of the *mode* argument is invalid. |

10564 [EINVAL] The *fildes* argument refers to a pipe and the implementation disallows
10565 execution of *fchmod*( ) on a pipe.

10566 **EXAMPLES**

10567 **Changing the Current Permissions for a File**

10568 The following example shows how to change the permissions for a file named **/home/cnd/mod1**
10569 so that the owner and group have read/write/execute permissions, but the world only has
10570 read/write permissions.

```
10571 #include <sys/stat.h>
10572 #include <fcntl.h>

10573 mode_t mode;
10574 int    fildes;
10575 ...
```

```
        fildes = open("/home/cnd/mod1", O_RDWR);
        fchmod(fildes, S_IRWXU | S_IRWXG | S_IROTH | S_IWOTH);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE and aligned with *fchmod*( ) in the POSIX Realtime Extension. Specifically, the second paragraph of the DESCRIPTION is added and a second instance of [EINVAL] is defined in the list of optional errors.

Issue 6

The DESCRIPTION is updated for alignment with IEEE Std. 1003.1j-2000 by stating that *fchmod*( ) behavior is unspecified for typed memory objects.

NAME

fchown — change owner and group of a file

SYNOPSIS

```
#include <unistd.h>

int fchown(int fildes, uid_t owner, gid_t group);
```

DESCRIPTION

The *fchown*( ) function has the same effect as *chown*( ) except that the file whose owner and group are changed is specified by the file descriptor *fildes*.

RETURN VALUE

Upon successful completion, *fchown*( ) shall return 0. Otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *fchown*( ) function shall fail if:

[EBADF] The *fildes* argument is not an open file descriptor.

[EPERM] The effective user ID does not match the owner of the file or the process does not have appropriate privilege and _POSIX_CHOWN_RESTRICTED indicates that such privilege is required.

[EROFS] The file referred to by *fildes* resides on a read-only file system.

The *fchown*( ) function may fail if:

[EINVAL] The owner or group ID is not a value supported by the implementation. The *fildes* argument refers to a pipe and the implementation disallows execution of *fchown*( ) on a pipe.

Notes to Reviewers

This section with side shading will not appear in the final copy. - Ed.

D3, XSH, ERN 177 states that STREAMS ignore the call, but raises a question about AF_UNIX sockets in the file system name space.

[EIO] A physical I/O error has occurred.

[EINTR] The *fchown*( ) function was interrupted by a signal which was caught.

EXAMPLES

Changing the Current Owner of a File

The following example shows how to change the owner of a file named **/home/cnd/mod1** to ‘‘jones’’ and the group to ‘‘cnd’’.

The numeric value for the user ID is obtained by extracting the user ID from the user database entry associated with ‘‘jones’’. Similarly, the numeric value for the group ID is obtained by extracting the group ID from the group database entry associated with ‘‘cnd’’. This example assumes the calling program has appropriate privileges.

```
#include <sys/types.h>
#include <unistd.h>
#include <fcntl.h>
#include <pwd.h>
#include <grp.h>
```

```
10637       struct passwd *pwd;
10638       struct group  *grp;
10639       int            fildes;
10640       ...
10641       fildes = open("/home/cnd/mod1", O_RDWR);
10642       pwd = getpwnam("jones");
10643       grp = getgrnam("cnd");
10644       fchown(fildes, pwd->pw_uid, grp->gr_gid);
```

10645 **APPLICATION USAGE**

10646 None.

10647 **RATIONALE**

10648 None.

10649 **FUTURE DIRECTIONS**

10650 None.

10651 **SEE ALSO**

10652 *chown*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<unistd.h>** |

10653 **CHANGE HISTORY**

10654 First released in Issue 4, Version 2.

10655 **Issue 5**

10656 Moved from X/OPEN UNIX extension to BASE.

10657 **Issue 6**

10658 The following changes were made to align with the IEEE P1003.1a draft standard:

10659 • Clarification is added that a call to *fchown*( ) may not be allowed on a pipe.

10660 The *fchwon*( ) function is now defined as mandatory. |

10661 **NAME**

10662 fclose — close a stream

10663 **SYNOPSIS**

10664 `#include <stdio.h>`

10665 `int fclose(FILE *stream);`

10666 **DESCRIPTION**

10667 CX The functionality described on this reference page is aligned with the ISO C standard. Any
10668 conflict between the requirements described here and the ISO C standard is unintentional. This
10669 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

10670 The *fclose*( ) function shall cause the stream pointed to by *stream* to be flushed and the associated
10671 file to be closed. Any unwritten buffered data for the stream shall be written to the file; any
10672 unread buffered data shall be discarded. Whether or not the call succeeds, the stream shall be
10673 disassociated from the file and any buffer set by the *setbuf*( ) or *setvbuf*( ) function shall be
10674 disassociated from the stream. If the associated buffer was automatically allocated, it shall be
10675 CX deallocated. It shall mark for update the *st_ctime* and *st_mtime* fields of the underlying file, if the
10676 stream was writable, and if buffered data remains that has not yet been written to the file. The
10677 *fclose*( ) function shall perform the equivalent of a *close*( ) on the file descriptor that is associated
10678 with the stream pointed to by *stream*.

10679 After the call to *fclose*( ), any use of *stream* results in undefined behavior.

10680 **RETURN VALUE**

10681 CX Upon successful completion, *fclose*( ) shall return 0; otherwise, it shall return EOF and set *errno* to
10682 indicate the error.

10683 **ERRORS**

10684 The *fclose*( ) function shall fail if:

10685 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and the
10686 process would be delayed in the write operation.

10687 CX [EBADF] The file descriptor underlying stream is not valid.

10688 CX [EFBIG] An attempt was made to write a file that exceeds the maximum file size.

10689 XSI [EFBIG] An attempt was made to write a file that exceeds the process' file size limit.

10690 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the
10691 offset maximum associated with the corresponding stream.

10692 CX [EINTR] The *fclose*( ) function was interrupted by a signal.

10693 CX [EIO] The process is a member of a background process group attempting to write
10694 to its controlling terminal, TOSTOP is set, the process is neither ignoring nor
10695 blocking SIGTTOU, and the process group of the process is orphaned. This
10696 error may also be returned under implementation-defined conditions.

10697 CX [ENOSPC] There was no free space remaining on the device containing the file.

10698 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by
10699 any process. A SIGPIPE signal shall also be sent to the thread.

10700 The *fclose*( ) function may fail if:

10701 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
10702 capabilities of the device.

10703 **EXAMPLES**

10704 None.

10705 **APPLICATION USAGE**

10706 None.

10707 **RATIONALE**

10708 None.

10709 **FUTURE DIRECTIONS**

10710 None.

10711 **SEE ALSO**

10712 *close*( ), *fopen*( ), *getrlimit*( ), *ulimit*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, |
10713 **<stdio.h>**

10714 **CHANGE HISTORY**

10715 First released in Issue 1. Derived from Issue 1 of the SVID. |

10716 **Issue 4**

10717 The last sentence of the first paragraph in the DESCRIPTION is changed to say *close*( ) instead of
10718 *fclose*( ). This was an error in Issue 3.

10719 The following paragraph is withdrawn from the DESCRIPTION (by POSIX as well as X/Open)
10720 because of the possibility of causing applications to malfunction, and the impossibility of
10721 implementing these mechanisms for pipes:

10722 > If the file is not already at EOF, and the file is one capable of seeking, the file *offset* of the
10723 > underlying open file description is adjusted so that the next operation on the open file
10724 > description deals with the byte after the last one read from or written to the stream being
10725 > closed.

10726 It is replaced with a statement that any subsequent use of *stream* is undefined.

10727 The [EFBIG] error is marked to indicate the extensions.

10728 **Issue 4, Version 2**

10729 A cross-reference to *getrlimit*( ) is added.

10730 **Issue 5**

10731 Large File Summit extensions are added.

10732 **Issue 6**

10733 Extensions beyond the ISO C standard are now marked.

10734 The following new requirements on POSIX implementations derive from alignment with the
10735 Single UNIX Specification:

10736 - The [EFBIG] error is added as part of the large file support extensions.

10737 - The [ENXIO] optional error condition is added.

10738 The DESCRIPTION is updated to note that the stream and any buffer are disassociated whether |
10739 or not the call succeeds. This is for alignment with the ISO/IEC 9899: 1999 standard. |

10740 **NAME**

10741 fcntl — file control

10742 **SYNOPSIS**

10743 OH
```
#include <unistd.h>
```
10744
```
#include <fcntl.h>
```
10745
```
int fcntl(int fildes, int cmd, ...);
```

10746 **DESCRIPTION**

10747 The *fcntl*( ) function provides for control over open files. The *fildes* argument is a file descriptor.

10748 The available values for *cmd* are defined in **<fcntl.h>**, which include:

10749 F_DUPFD Return a new file descriptor which is the lowest numbered available (that is,
10750 not already open) file descriptor greater than or equal to the third argument,
10751 *arg*, taken as an integer of type **int**. The new file descriptor refers to the same
10752 open file description as the original file descriptor, and shares any locks. The
10753 FD_CLOEXEC flag associated with the new file descriptor is cleared to keep
10754 the file open across calls to one of the *exec* functions.

10755 F_GETFD Get the file descriptor flags defined in **<fcntl.h>** that are associated with the
10756 file descriptor *fildes*. File descriptor flags are associated with a single file
10757 descriptor and do not affect other file descriptors that refer to the same file.

10758 F_SETFD Set the file descriptor flags defined in **<fcntl.h>**, that are associated with *fildes*,
10759 to the third argument, *arg*, taken as type **int**. If the FD_CLOEXEC flag in the
10760 third argument is 0, the file shall remain open across the *exec* functions;
10761 otherwise, the file shall be closed upon successful execution of one of the *exec*
10762 functions.

10763 F_GETFL Get the file status flags and file access modes, defined in **<fcntl.h>**, for the file
10764 description associated with *fildes*. The file access modes can be extracted from
10765 the return value using the mask O_ACCMODE, which is defined in **<fcntl.h>**.
10766 File status flags and file access modes are associated with the file description
10767 and do not affect other file descriptors that refer to the same file with different
10768 open file descriptions.

10769 F_SETFL Set the file status flags, defined in **<fcntl.h>**, for the file description associated
10770 with *fildes* from the corresponding bits in the third argument, *arg*, taken as
10771 type **int**. Bits corresponding to the file access mode and the *oflag* values that
10772 are set in *arg* are ignored. If any bits in *arg* other than those mentioned here are
10773 changed by the application, the result is unspecified.

10774 F_GETOWN If *fildes* refers to a socket, get the process or process group ID specified to
10775 receive SIGURG signals when out-of-band data is available. Positive values
10776 indicate a process ID; negative values, other than –1, indicate a process group
10777 ID. If *fildes* does not refer to a socket, the results are unspecified.

10778 F_SETOWN If *fildes* refers to a socket, set the process or process group ID specified to
10779 receive SIGURG signals when out-of-band data is available, using the value of
10780 the third argument, *arg*, taken as type **int**. Positive values indicate a process
10781 ID; negative values, other than –1, indicate a process group ID. If *fildes* does
10782 not refer to a socket, the results are unspecified.

10783 The following values for *cmd* are available for advisory record locking. Record locking is
10784 supported for regular files, and may be supported for other files.

F_GETLK Get the first lock which blocks the lock description pointed to by the third argument, *arg*, taken as a pointer to type **struct flock**, defined in **<fcntl.h>**. The information retrieved overwrites the information passed to *fcntl*( ) in the structure **flock**. If no lock is found that would prevent this lock from being created, then the structure shall be left unchanged except for the lock type which shall be set to F_UNLCK.

F_SETLK Set or clear a file segment lock according to the lock description pointed to by the third argument, *arg*, taken as a pointer to type **struct flock**, defined in **<fcntl.h>**. F_SETLK is used to establish shared (or read) locks (F_RDLCK) or exclusive (or write) locks (F_WRLCK), as well as to remove either type of lock (F_UNLCK). F_RDLCK, F_WRLCK, and F_UNLCK are defined in **<fcntl.h>**. If a shared or exclusive lock cannot be set, *fcntl*( ) shall return immediately with a return value of –1.

F_SETLKW This command is the same as F_SETLK except that if a shared or exclusive lock is blocked by other locks, the thread shall wait until the request can be satisfied. If a signal that is to be caught is received while *fcntl*( ) is waiting for a region, *fcntl*( ) shall be interrupted. Upon return from the signal handler, *fcntl*( ) shall return –1 with *errno* set to [EINTR], and the lock operation shall not be done.

Additional implementation-defined values for *cmd* may be defined in **<fcntl.h>**. Their names shall start with F_.

When a shared lock is set on a segment of a file, other processes shall be able to set shared locks on that segment or a portion of it. A shared lock prevents any other process from setting an exclusive lock on any portion of the protected area. A request for a shared lock shall fail if the file descriptor was not opened with read access.

An exclusive lock shall prevent any other process from setting a shared lock or an exclusive lock on any portion of the protected area. A request for an exclusive lock shall fail if the file descriptor was not opened with write access.

The structure **flock** describes the type (*l_type*), starting offset (*l_whence*), relative offset (*l_start*), size (*l_len*), and process ID (*l_pid*) of the segment of the file to be affected.

The value of *l_whence* is {SEEK_SET}, {SEEK_CUR}, or {SEEK_END}, to indicate that the relative offset *l_start* bytes shall be measured from the start of the file, current position, or end of the file, respectively. The value of *l_len* is the number of consecutive bytes to be locked. The value of *l_len* may be negative (where the definition of **off_t** permits negative values of *l_len*). The *l_pid* field is only used with F_GETLK to return the process ID of the process holding a blocking lock. After a successful F_GETLK request, when a blocking lock is found, the values returned in the **flock** structure shall be as follows:

l_type Type of blocking lock found.

l_whence {SEEK_SET}.

l_start Start of the blocking lock.

l_len Length of the blocking lock.

l_pid Process ID of the process that holds the blocking lock.

If the command is F_SETLKW and the process must wait for another process to release a lock, then the range of bytes to be locked shall be determined before the *fcntl*( ) function blocks. If the file size or file descriptor seek offset change while *fcntl*( ) is blocked, this shall not affect the range of bytes locked.

If *l_len* is positive, the area affected starts at *l_start* and ends at *l_start*+ *l_len*−1. If *l_len* is negative, the area affected starts at *l_start*+ *l_len* and ends at *l_start*−1. Locks may start and extend beyond the current end of a file, but the application shall ensure that they are not negative relative to the beginning of the file. A lock shall be set to extend to the largest possible value of the file offset for that file by setting *l_len* to 0. If such a lock also has *l_start* set to 0 and *l_whence* is set to {SEEK_SET}, the whole file shall be locked.

There shall be at most one type of lock set for each byte in the file. Before a successful return from an F_SETLK or an F_SETLKW request when the calling process has previously existing locks on bytes in the region specified by the request, the previous lock type for each byte in the specified region shall be replaced by the new lock type. As specified above under the descriptions of shared locks and exclusive locks, an F_SETLK or an F_SETLKW request (respectively) shall fail or block when another process has existing locks on bytes in the specified region and the type of any of those locks conflicts with the type specified in the request.

All locks associated with a file for a given process shall be removed when a file descriptor for that file is closed by that process or the process holding that file descriptor terminates. Locks are not inherited by a child process.

A potential for deadlock occurs if a process controlling a locked region is put to sleep by attempting to lock another process' locked region. If the system detects that sleeping until a locked region is unlocked would cause a deadlock, *fcntl*( ) shall fail with an [EDEADLK] error.

SHM When the file descriptor *fildes* refers to a shared memory object, the behavior of *fcntl*( ) shall be the same as for a regular file except the effect of the following values for the argument *cmd* shall be unspecified: F_SETFL, F_GETLK, F_SETLK, and F_SETLKW.

TYM If *fildes* refers to a typed memory object, the result of the *fcntl*( ) function is unspecified.

An unlock (F_UNLCK) request in which *l_len* is non-zero and the offset of the last byte of the requested segment is the maximum value for an object of type **off_t**, when the process has an existing lock in which *l_len* is 0 and which includes the last byte of the requested segment, shall be treated as a request to unlock from the start of the requested segment with an *l_len* equal to 0. Otherwise, an unlock (F_UNLCK) request shall attempt to unlock only the requested segment.

RETURN VALUE

Upon successful completion, the value returned shall depend on *cmd* as follows:

F_DUPFD	A new file descriptor.
F_GETFD	Value of flags defined in **<fcntl.h>**. The return value shall not be negative.
F_SETFD	Value other than –1.
F_GETFL	Value of file status flags and access modes. The return value is not negative.
F_SETFL	Value other than –1.
F_GETLK	Value other than –1.
F_SETLK	Value other than –1.
F_SETLKW	Value other than –1.
F_GETOWN	Value of the socket owner process or process group; this will not be –1.
F_SETOWN	Value other than –1.

Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *fcntl*( ) function shall fail if:

[EACCES] or [EAGAIN]
: The *cmd* argument is F_SETLK; the type of lock (*l_type*) is a shared (F_RDLCK) or exclusive (F_WRLCK) lock and the segment of a file to be locked is already exclusive-locked by another process, or the type is an exclusive lock and some portion of the segment of a file to be locked is already shared-locked or exclusive-locked by another process.

[EBADF]
: The *fildes* argument is not a valid open file descriptor, or the argument *cmd* is F_SETLK or F_SETLKW, the type of lock, *l_type*, is a shared lock (F_RDLCK), and *fildes* is not a valid file descriptor open for reading, or the type of lock *l_type*, is an exclusive lock (F_WRLCK), and *fildes* is not a valid file descriptor open for writing.

[EINTR]
: The *cmd* argument is F_SETLKW and the function was interrupted by a signal.

[EINVAL]
: The *cmd* argument is invalid, or the *cmd* argument is F_DUPFD and *arg* is negative or greater than or equal to {OPEN_MAX}, or the *cmd* argument is F_GETLK, F_SETLK, or F_SETLKW and the data pointed to by *arg* is not valid, or *fildes* refers to a file that does not support locking.

[EMFILE]
: The argument *cmd* is F_DUPFD and {OPEN_MAX} file descriptors are currently open in the calling process, or no file descriptors greater than or equal to *arg* are available.

[ENOLCK]
: The argument *cmd* is F_SETLK or F_SETLKW and satisfying the lock or unlock request would result in the number of locked regions in the system exceeding a system-imposed limit.

[EOVERFLOW]
: One of the values to be returned cannot be represented correctly.

[EOVERFLOW]
: The *cmd* argument is F_GETLK, F_SETLK, or F_SETLKW and the smallest or, if *l_len* is non-zero, the largest offset of any byte in the requested segment cannot be represented correctly in an object of type **off_t**.

The *fcntl*( ) function may fail if:

[EDEADLK]
: The *cmd* argument is F_SETLKW, the lock is blocked by some lock from another process and putting the calling process to sleep, waiting for that lock to become free would cause a deadlock.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The ellipsis in the SYNOPSIS is the syntax specified by the ISO C standard for a variable number of arguments. It is used because System V uses pointers for the implementation of file locking functions.

The *arg* values to F_GETFD, F_SETFD, F_GETFL, and F_SETFL all represent flag values to allow for future growth. Applications using these functions should do a read-modify-write operation on them, rather than assuming that only the values defined by this volume of IEEE Std. 1003.1-200x are valid. It is a common error to forget this, particularly in the case of F_SETFD.

This volume of IEEE Std. 1003.1-200x permits concurrent read and write access to file data using the *fcntl*( ) function; this is a change from the 1984 /usr/group standard and early proposals. Without concurrency controls, this feature may not be fully utilized without occasional loss of data.

Data losses occur in several ways. One case occurs when several processes try to update the same record, without sequencing controls; several updates may occur in parallel and the last writer ''wins''. Another case is a bit-tree or other internal list-based database that is undergoing reorganization. Without exclusive use to the tree segment by the updating process, other reading processes chance getting lost in the database when the index blocks are split, condensed, inserted, or deleted. While *fcntl*( ) is useful for many applications, it is not intended to be overly general and does not handle the bit-tree example well.

This facility is only required for regular files because it is not appropriate for many devices such as terminals and network connections.

Since *fcntl*( ) works with ''any file descriptor associated with that file, however it is obtained'', the file descriptor may have been inherited through a *fork*( ) or *exec* operation and thus may affect a file that another process also has open.

The use of the open file description to identify what to lock requires extra calls and presents problems if several processes are sharing an open file description, but there are too many implementations of the existing mechanism for this volume of IEEE Std. 1003.1-200x to use different specifications.

Another consequence of this model is that closing any file descriptor for a given file (whether or not it is the same open file description that created the lock) causes the locks on that file to be relinquished for that process. Equivalently, any close for any file/process pair relinquishes the locks owned on that file for that process. But note that while an open file description may be shared through *fork*( ), locks are not inherited through *fork*( ). Yet locks may be inherited through one of the *exec* functions.

The identification of a machine in a network environment is outside of the scope of this volume of IEEE Std. 1003.1-200x. Thus, an *l_sysid* member, such as found in System V, is not included in the locking structure.

Before successful return from an F_SETLK or F_SETLKW request, the previous lock type for each byte in the specified region shall be replaced by the new lock type. This can result in a previously locked region being split into smaller regions. If this would cause the number of regions being held by all processes in the system to exceed a system-imposed limit, the *fcntl*( ) function shall return –1 with *errno* set to [ENOLCK].

Mandatory locking was a major feature of the 1984 /usr/group standard.

For advisory file record locking to be effective, all processes that have access to a file must cooperate and use the advisory mechanism before doing I/O on the file. Enforcement-mode record locking is important when it cannot be assumed that all processes are cooperating. For example, if one user uses an editor to update a file at the same time that a second user executes another process that updates the same file and if only one of the two processes is using advisory locking, the processes are not cooperating. Enforcement-mode record locking would protect against accidental collisions.

Secondly, advisory record locking requires a process using locking to bracket each I/O operation with lock (or test) and unlock operations. With enforcement-mode file and record locking, a process can lock the file once and unlock when all I/O operations have been completed. Enforcement-mode record locking provides a base that can be enhanced; for example, with sharable locks. That is, the mechanism could be enhanced to allow a process to lock a file so

10964 other processes could read it, but none of them could write it.

10965 Mandatory locks were omitted for several reasons:

10966 1. Mandatory lock setting was done by multiplexing the set-group-ID bit in most
10967 implementations; this was confusing, at best.

10968 2. The relationship to file truncation as supported in 4.2 BSD was not well specified.

10969 3. Any publicly readable file could be locked by anyone. Many historical implementations
10970 keep the password database in a publicly readable file. A malicious user could thus
10971 prohibit logins. Another possibility would be to hold open a long-distance telephone line.

10972 4. Some demand-paged historical implementations offer memory mapped files, and
10973 enforcement cannot be done on that type of file.

10974 Since sleeping on a region is interrupted with any signal, *alarm*( ) may be used to provide a
10975 timeout facility in applications requiring it. This is useful in deadlock detection. Because
10976 implementation of full deadlock detection is not always feasible, the [EDEADLK] error was |
10977 made optional.

10978 **FUTURE DIRECTIONS**

10979 None.

10980 **SEE ALSO**

10981 *close*( ), *exec*, *open*( ), *sigaction*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<fcntl.h>**, |
10982 **<signal.h>**, **<unistd.h>**

10983 **CHANGE HISTORY**

10984 First released in Issue 1. Derived from Issue 1 of the SVID. |

10985 **Issue 4**

10986 The **<sys/types.h>** and **<unistd.h>** headers are now marked as optional (OH); these headers do
10987 not need to be included on XSI-conformant systems.

10988 In the DESCRIPTION, sentences describing behavior when *l_len* is negative are marked as an
10989 extension, and the description of locks is corrected to make it a requirement on the application.

10990 The following change is incorporated for alignment with the ISO POSIX-1 standard:

10991 • In the DESCRIPTION, the meaning of a successful F_SETLK or F_SETLKW request is
10992 clarified, after a POSIX Request for Interpretation.

10993 **Issue 5**

10994 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
10995 Threads Extension.

10996 Large File Summit extensions are added.

10997 **Issue 6**

10998 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

10999 The following new requirements on POSIX implementations derive from alignment with the
11000 Single UNIX Specification:

11001 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
11002 required for conforming implementations of previous POSIX specifications, it was not
11003 required for UNIX applications.

11004 • In the DESCRIPTION, sentences describing behavior when *l_len* is negative are now
11005 mandated, and the description of unlock (F_UNLOCK) when *l_len* is non-negative is
11006 mandated.

- In the ERRORS section, the [EINVAL] error condition has the case mandated when the *cmd* is invalid, and two [EOVERFLOW] error conditions are added.

The F_GETOWN and F_SETOWN values are added for sockets.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Clarification is added that the extent of the bytes locked is determined prior to the blocking action.

The DESCRIPTION is updated for alignment with IEEE Std. 1003.1j-2000 by specifying that *fcntl*( ) results are unspecified for typed memory objects.

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

11016 **NAME**

11017 fcvt — convert a floating-point number to a string (**LEGACY**)

11018 **SYNOPSIS**

11019 XSI
```
#include <stdlib.h>
```

11020 11021 11022
```
char *fcvt(double value, int ndigit, int *restrict decpt,
    int *restrict sign);
```

11023 **DESCRIPTION**

11024 Refer to *ecvt*( ).

NAME

fdatasync — synchronize the data of a file (**REALTIME**)

SYNOPSIS

SIO
```
#include <unistd.h>

int fdatasync(int fildes);
```

DESCRIPTION

The *fdatasync*( ) function shall force all currently queued I/O operations associated with the file indicated by file descriptor *fildes* to the synchronized I/O completion state.

The functionality is as described for *fsync*( ) (with the symbol _POSIX_SYNCHRONIZED_IO defined), with the exception that all I/O operations shall be completed as defined for synchronized I/O data integrity completion.

RETURN VALUE

If successful, the *fdatasync*( ) function shall return the value 0; otherwise, the function shall return the value −1 and set *errno* to indicate the error. If the *fdatasync*( ) function fails, outstanding I/O operations are not guaranteed to have been completed.

ERRORS

The *fdatasync*( ) function shall fail if:

[EBADF] The *fildes* argument is not a valid file descriptor open for writing. |

[EINVAL] This implementation does not support synchronized I/O for this file. |

In the event that any of the queued I/O operations fail, *fdatasync*( ) shall return the error conditions defined for *read*( ) and *write*( ).

EXAMPLES

None.

APPLICATION USAGE

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Synchronized Input and Output option. |

The *fdatasync*( ) function is marked as part of the Synchronized Input and Output option. |

11064 **NAME**

11065 fdetach — detach a name from a STREAMS-based file descriptor (**STREAMS**)

11066 **SYNOPSIS**

11067 XSR
```
#include <stropts.h>
```

11068
```
int fdetach(const char *path);
```

11069

11070 **DESCRIPTION**

11071 The *fdetach*( ) function detaches a STREAMS-based file from the file to which it was attached by a
11072 previous call to *fattach*( ). The *path* argument points to the path name of the attached STREAMS
11073 file. The application shall ensure that the process has appropriate privileges or be the owner of
11074 the file. A successful call to *fdetach*( ) shall cause all path names that named the attached
11075 STREAMS file to again name the file to which the STREAMS file was attached. All subsequent
11076 operations on *path* shall operate on the underlying file and not on the STREAMS file.

11077 All open file descriptions established while the STREAMS file was attached to the file referenced
11078 by *path* shall still refer to the STREAMS file after the *fdetach*( ) has taken effect.

11079 If there are no open file descriptors or other references to the STREAMS file, then a successful
11080 call to *fdetach*( ) shall have the same effect as performing the last *close*( ) on the attached file.

11081 **RETURN VALUE**

11082 Upon successful completion, *fdetach*( ) shall return 0; otherwise, it shall return –1 and set *errno* to
11083 indicate the error.

11084 **ERRORS**

11085 The *fdetach*( ) function shall fail if:

11086 [EACCES] Search permission is denied on a component of the path prefix. |

11087 [EINVAL] The *path* argument names a file that is not currently attached. |

11088 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path* |
11089 argument. |

11090 [ENAMETOOLONG] |
11091 The size of a path name exceeds {PATH_MAX} or a path name component is |
11092 longer than {NAME_MAX}. |

11093 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string. |

11094 [ENOTDIR] A component of the path prefix is not a directory. |

11095 [EPERM] The effective user ID is not the owner of *path* and the process does not have |
11096 appropriate privileges. |

11097 The *fdetach*( ) function may fail if:

11098 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during |
11099 resolution of the *path* argument. |

11100 [ENAMETOOLONG] |
11101 Path name resolution of a symbolic link produced an intermediate result
11102 whose length exceeds {PATH_MAX}.

EXAMPLES

Detaching a File

The following example detaches the STREAMS-based file **/tmp/named-STREAM** from the file to which it was attached by a previous, successful call to *fattach*( ). Subsequent calls to open this file refer to the underlying file, not to the STREAMS file.

```
#include <stropts.h>
...
    char *filename = "/tmp/named-STREAM";
    int ret;

    ret = fdetach(filename);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

fattach( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stropts.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

11129 **NAME**

11130 fdim, fdimf, fdiml — compute positive difference between two floating-point numbers

11131 **SYNOPSIS**

11132
```
#include <math.h>
```

11133
```
double fdim(double x, double y);
```
11134
```
float fdimf(float x, float y);
```
11135
```
long double fdiml(long double x, long double y);
```

11136 **DESCRIPTION**

11137 CX The functionality described on this reference page is aligned with the ISO C standard. Any
11138 conflict between the requirements described here and the ISO C standard is unintentional. This
11139 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

11140 These functions shall determine the positive difference between their arguments. If *x* is greater
11141 than *y*, *x*–*y* is returned. If *x* is less than or equal to *y*, +0 is returned.

11142 An application wishing to check for error situations should set *errno* to 0 before calling these
11143 functions. If *errno* is non-zero on return, or the return value is NaN, an error has occurred.

11144 **RETURN VALUE**

11145 Upon successful completion, these functions shall return the positive difference value.

11146 If *x* or *y* is NaN, NaN shall be returned and *errno* may be set to [EDOM].

11147 If the magnitude of the result is too large or too small, the numeric result is unspecified and *errno*
11148 may be set to [ERANGE].

11149 **ERRORS**

11150 These functions may fail if:

11151 [EDOM] The value of *x* or *y* is NaN.

11152 [ERANGE] The magnitude of the result is too large or too small.

11153 **EXAMPLES**

11154 None.

11155 **APPLICATION USAGE**

11156 None.

11157 **RATIONALE**

11158 None.

11159 **FUTURE DIRECTIONS**

11160 None.

11161 **SEE ALSO**

11162 *fmax*( ), *fmin*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<math.h>**

11163 **CHANGE HISTORY**

11164 First released in Issue 6. Derived from the ISO / IEC 9899: 1999 standard.

11165 **NAME**

11166 fdopen — associate a stream with a file descriptor

11167 **SYNOPSIS**

11168 `#include <stdio.h>`

11169 `FILE *fdopen(int fildes, const char *mode);`

11170 **DESCRIPTION**

11171 The *fdopen*( ) function shall associate a stream with a file descriptor.

11172 The *mode* argument is a character string having one of the following values:

11173 *r* or *rb*	Open a file for reading.
11174 *w* or *wb*	Open a file for writing.
11175 *a* or *ab*	Open a file for writing at end of file.
11176 *r+* or *rb+* or *r+b*	Open a file for update (reading and writing).
11177 *w+* or *wb+* or *w+b*	Open a file for update (reading and writing).
11178 *a+* or *ab+* or *a+b*	Open a file for update (reading and writing) at end of file.

11179 The meaning of these flags is exactly as specified in *fopen*( ), except that modes beginning with *w*
11180 do not cause truncation of the file.

11181 Additional values for the *mode* argument may be supported by an implementation.

11182 The application shall ensure that the mode of the stream as expressed by the *type* argument is
11183 allowed by the file access mode of the open file description to which *fildes* refers. The file
11184 position indicator associated with the new stream is set to the position indicated by the file
11185 offset associated with the file descriptor.

11186 The error and end-of-file indicators for the stream shall be cleared. The *fdopen*( ) function may
11187 cause the *st_atime* field of the underlying file to be marked for update.

11188 SHM If *fildes* refers to a shared memory object, the result of the *fdopen*( ) function is unspecified.

11189 TYM If *fildes* refers to a typed memory object, the result of the *fdopen*( ) function is unspecified.

11190 The *fdopen*( ) function shall preserve the offset maximum previously set for the open file
11191 description corresponding to *fildes*.

11192 **RETURN VALUE**

11193 Upon successful completion, *fdopen*( ) shall return a pointer to a stream; otherwise, a null pointer
11194 shall be returned and *errno* set to indicate the error.

11195 **ERRORS**

11196 The *fdopen*( ) function may fail if:

11197	[EBADF]	The *fildes* argument is not a valid file descriptor. |
11198	[EINVAL]	The *mode* argument is not a valid mode. |
11199	[EMFILE]	{FOPEN_MAX} streams are currently open in the calling process. |
11200	[EMFILE]	{STREAM_MAX} streams are currently open in the calling process. |
11201	[ENOMEM]	Insufficient space to allocate a buffer. |

11202 **EXAMPLES**

11203 None.

11204 **APPLICATION USAGE**

11205 File descriptors are obtained from calls like *open*( ), *dup*( ), *creat*( ), or *pipe*( ), which open files but
11206 do not return streams.

11207 **RATIONALE**

11208 The file descriptor may have been obtained from *open*( ), *creat*( ), *pipe*( ), *dup*( ), or *fcntl*( );
11209 inherited through *fork*( ) or *exec*; or perhaps obtained by implementation-defined means, such as
11210 the 4.3 BSD *socket*( ) call.

11211 The meanings of the *type* arguments of *fdopen*( ) and *fopen*( ) differ. With *fdopen*( ), open for write
11212 (*w* or *w*+) does not truncate, and append (*a* or *a*+) cannot create for writing. There is no need for *b*
11213 in the format due to the equivalence of binary and text files in this volume of
11214 IEEE Std. 1003.1-200x. Although not explicitly required by this volume of IEEE Std. 1003.1-200x,
11215 a good implementation of append (*a*) mode would cause the O_APPEND flag to be set.

11216 **FUTURE DIRECTIONS**

11217 None.

11218 **SEE ALSO**

11219 *fclose*( ), *fopen*( ), *open*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdio.h>**, Section
11220 2.5.1 (on page 535)

11221 **CHANGE HISTORY**

11222 First released in Issue 1. Derived from Issue 1 of the SVID.

11223 **Issue 4**

11224 In the DESCRIPTION, the use and settings of the *mode* argument are changed to include binary
11225 streams and are marked as extensions.

11226 All errors identified in the ERRORS section are marked as extensions, and the [EMFILE] error is
11227 added.

11228 The APPLICATION USAGE section is added.

11229 The following change is incorporated for alignment with the ISO POSIX-1 standard:

11230 • The type of argument *mode* is changed from **char*** to **const char***.

11231 **Issue 5**

11232 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

11233 Large File Summit extensions are added.

11234 **Issue 6**

11235 The following new requirements on POSIX implementations derive from alignment with the
11236 Single UNIX Specification:

11237 • In the DESCRIPTION, the use and setting of the *mode* argument are changed to include
11238 binary streams.

11239 • In the DESCRIPTION, text is added for large file support to indicate setting of the offset
11240 maximum in the open file description.

11241 • All errors identified in the ERRORS section are added.

11242 • In the DESCRIPTION, text is added that the *fdopen*( ) function may cause *st_atime* to be
11243 updated.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Clarification is added that it is the responsibility of the application to ensure that the mode is compatible with the open file descriptor.

The DESCRIPTION is updated for alignment with IEEE Std. 1003.1j-2000 by specifying that *fdopen*( ) results are unspecified for typed memory objects.

11249 **NAME**

11250 feclearexcept — clear floating-point exception

11251 **SYNOPSIS**

11252 `#include <fenv.h>`

11253 `void feclearexcept(int excepts);`

11254 **DESCRIPTION**

11255 CX The functionality described on this reference page is aligned with the ISO C standard. Any
11256 conflict between the requirements described here and the ISO C standard is unintentional. This
11257 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

11258 The *feclearexcept*( ) function shall clear the supported floating-point exceptions represented by
11259 *excepts*.

11260 **RETURN VALUE**

11261 None.

11262 **ERRORS**

11263 No errors are defined.

11264 **EXAMPLES**

11265 None.

11266 **APPLICATION USAGE**

NAME

fegetexceptflag, fesetexceptflag — get and set floating-point status flags

SYNOPSIS

```
#include <fenv.h>

void fegetexceptflag(fexcept_t *flagp, int excepts);
void fesetexceptflag(const fexcept_t *flagp, int excepts);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

The *fegetexceptflag*( ) function shall store an implementation-defined representation of the states of the floating-point status flags indicated by the argument *excepts* in the object pointed to by the argument *flagp*.

The *fesetexceptflag*( ) function shall set the floating-point status flags indicated by the argument excepts to the states stored in the object pointed to by *flagp*. The value pointed to by *flagp* shall have been set by a previous call to *fegetexceptflag*( ) whose second argument represented at least those floating-point exceptions represented by the argument *excepts*. This function does not raise floating-point exceptions, but only sets the state of the flags.

RETURN VALUE

None.

ERRORS

No errors are defined.

CHANGE HISTORY

First released in Issue 6. Derived from the ISO / IEC 9899: 1999 standard.

NAME

fegetround, fesetround — get and set current rounding direction

SYNOPSIS

```
#include <fenv.h>

int fegetround(void);
int fesetround(int round);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

The *fegetround*( ) function shall get the current rounding direction.

The *fesetround*( ) function shall establish the rounding direction represented by its argument *round*. If the argument is not equal to the value of a rounding direction macro, the rounding direction is not changed.

RETURN VALUE

The *fegetround*( ) function shall return the value of the rounding direction macro representing the current rounding direction or a negative value if there is no such rounding direction macro or the current rounding direction is not determinable.

The *fesetround*( ) function shall return a zero value if and only if the argument is equal to a rounding direction macro (that is, if and only if the requested rounding direction was established).

ERRORS

No errors are defined.

EXAMPLES

The following example saves, sets, and restores the rounding direction, reporting an error and aborting if setting the rounding direction fails:

```
#include <fenv.h>
#include <assert.h>
void f(int round_dir)
{
    #pragma STDC FENV_ACCESS ON
    int save_round;
    int setround_ok;
    save_round = fegetround();
    setround_ok = fesetround(round_dir);
    assert(setround_ok == 0);
    /* ... */
    fesetround(save_round);
    /* ... */
}
```

APPLICATION USAGE

None.

RATIONALE

None.

11389 **FUTURE DIRECTIONS**

11390 None.

11391 **SEE ALSO**

11392 The Base Definitions volume of IEEE Std. 1003.1-200x, **<fenv.h>**

11393 **CHANGE HISTORY**

11394 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

11395 **NAME**

11396 feholdexcept — save current floating-point environment

11397 **SYNOPSIS**

11398 `#include <fenv.h>`

11399 `int feholdexcept(fenv_t *`*`envp`*`);`

11400 **DESCRIPTION**

11401 CX The functionality described on this reference page is aligned with the ISO C standard. Any
11402 conflict between the requirements described here and the ISO C standard is unintentional. This
11403 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

11404 The *feholdexcept*( ) function shall save the current floating-point environment in the object
11405 pointed to by *envp*, clear the floating-point status flags, and then install a non-stop (continue on
11406 floating-point exceptions) mode, if available, for all floating-point exceptions.

11407 **RETURN VALUE**

11408 The *feholdexcept*( ) function shall return zero if and only if non-stop floating-point exception
11409 handling was successfully installed.

11410 **ERRORS**

11411 No errors are defined.

11412 **EXAMPLES**

11413 None.

11414 **APPLICATION USAGE**

11415 None.

11416 **RATIONALE**

11417 The *feholdexcept*( ) function should be effective on typical IEC 60559:1989 standard
11418 implementations which have the default non-stop mode and at least one other mode for trap
11419 handling or aborting. If the implementation provides only the non-stop mode, then installing the
11420 non-stop mode is trivial.

11421 **FUTURE DIRECTIONS**

11422 None.

11425 **<fenv.h>**

11426 **CHANGE HISTORY**

11427 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

11428 **NAME**

11429 feof — test end-of-file indicator on a stream

11430 **SYNOPSIS**

11431 `#include <stdio.h>`

11432 `int feof(FILE *stream);`

11433 **DESCRIPTION**

11434 CX The functionality described on this reference page is aligned with the ISO C standard. Any
11435 conflict between the requirements described here and the ISO C standard is unintentional. This
11436 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

11437 The *feof*( ) function shall test the end-of-file indicator for the stream pointed to by *stream*.

11438 **RETURN VALUE**

11439 The *feof*( ) function shall return non-zero if and only if the end-of-file indicator is set for *stream*.

11440 **ERRORS**

11441 No errors are defined.

11442 **EXAMPLES**

11443 None.

11444 **APPLICATION USAGE**

11445 None.

11446 **RATIONALE**

11447 None.

11448 **FUTURE DIRECTIONS**

11449 None.

11450 **SEE ALSO**

11452 **CHANGE HISTORY**

11453 First released in Issue 1. Derived from Issue 1 of the SVID. |

11454 **Issue 4**

11455 The ERRORS section is rewritten, such that no error return values are now defined for this |
11456 function.

11457 **NAME**

11458 feraiseexcept — raise floating-point exception

11459 **SYNOPSIS**

11460 `#include <fenv.h>`

11461 `void feraiseexcept(int excepts);`

11462 **DESCRIPTION**

11463 CX The functionality described on this reference page is aligned with the ISO C standard. Any
11464 conflict between the requirements described here and the ISO C standard is unintentional. This
11465 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

11466 The *feraiseexcept*( ) function shall raise the supported floating-point exceptions represented by
11467 the argument *excepts*. The order in which these floating-point exceptions are raised is
11468 unspecified. Whether the *feraiseexcept*( ) function additionally raises the inexact floating-point
11469 exception whenever it raises the overflow or underflow floating-point exception is
11470 implementation-defined.

11471 **RETURN VALUE**

11472 None.

11473 **ERRORS**

11474 No errors are defined.

11475 **EXAMPLES**

11476 None.

11477 **APPLICATION USAGE**

11478 The effect is intended to be similar to that of floating-point exceptions raised by arithmetic
11479 operations. Hence, enabled traps for floating-point exceptions raised by this function are taken.

11480 **RATIONALE**

11481 Raising overflow or underflow is allowed to also raise inexact because on some architectures the
11482 only practical way to raise an exception is to execute an instruction that has the exception as a
11483 side effect. The function is not restricted to accept only valid coincident expressions for atomic
11484 operations, so the function can be used to raise exceptions accrued over several operations.

11485 **FUTURE DIRECTIONS**

11486 None.

11490 **CHANGE HISTORY**

11491 First released in Issue 6. Derived from the ISO / IEC 9899: 1999 standard.

11492 **NAME**

11493 ferror — test error indicator on a stream

11494 **SYNOPSIS**

11495 `#include <stdio.h>`

11496 `int ferror(FILE *stream);`

11497 **DESCRIPTION**

11498 CX The functionality described on this reference page is aligned with the ISO C standard. Any
11499 conflict between the requirements described here and the ISO C standard is unintentional. This
11500 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

11501 The *ferror*( ) function shall test the error indicator for the stream pointed to by *stream*.

11502 **RETURN VALUE**

11503 The *ferror*( ) function shall return non-zero if and only if the error indicator is set for *stream*.

11504 **ERRORS**

11505 No errors are defined.

11506 **EXAMPLES**

11507 None.

11508 **APPLICATION USAGE**

11509 None.

11510 **RATIONALE**

11511 None.

11512 **FUTURE DIRECTIONS**

11513 None.

11514 **SEE ALSO**

11516 **CHANGE HISTORY**

11517 First released in Issue 1. Derived from Issue 1 of the SVID. |

11518 **Issue 4**

11519 The ERRORS section is rewritten, such that no error return values are now defined for this |
11520 function.

11521 **NAME**
11522 fesetenv — set current floating-point environment

11523 **SYNOPSIS**
11524 `#include <fenv.h>`

11525 `void fesetenv(const fenv_t *`*`envp`*`);`

11526 **DESCRIPTION**
11527 Refer to *fegetenv*( ).

11528 **NAME**

11529 fesetexceptflag — set floating-point status flags

11530 **SYNOPSIS**

11531 `#include <fenv.h>`

11532 `void fesetexceptflag(const fexcept_t *`*`flagp`*`, int `*`excepts`*`);`

11533 **DESCRIPTION**

11534 Refer to *fegetexceptflag*( ).

11535 **NAME**

11536 fesetround — set current rounding direction

11537 **SYNOPSIS**

11538 `#include <fenv.h>`

11539 `int fesetround(int` *`round`*`);`

11540 **DESCRIPTION**

11541 Refer to *fegetround*( ).

11542 **NAME**

11543 fetestexcept — test floating-point exception flags

11544 **SYNOPSIS**

11545
```
#include <fenv.h>
```

11546
```
int fetestexcept(int excepts);
```

11547 **DESCRIPTION**

11548 CX The functionality described on this reference page is aligned with the ISO C standard. Any
11549 conflict between the requirements described here and the ISO C standard is unintentional. This
11550 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

11551 The *fetestexcept*( ) function shall determine which of a specified subset of the floating-point
11552 exception flags are currently set. The *excepts* argument specifies the floating-point status flags to
11553 be queried.

11554 **RETURN VALUE**

11555 The *fetestexcept*( ) function shall return the value of the bitwise-inclusive OR of the floating-point
11556 exception macros corresponding to the currently set floating-point exceptions included in
11557 *excepts*.

11558 **ERRORS**

11559 No errors are defined.

11560 **EXAMPLES**

11561 The following example calls function *f*( ) if an invalid exception is set, and then function *g*( ) if an
11562 overflow exception is set:

```
11563     #include <fenv.h>
11564     /* ... */
11565     {
11566         #pragma STDC FENV_ACCESS ON
11567         int set_excepts;
11568         feclearexcept(FE_INVALID | FE_OVERFLOW);
11569         // maybe raise exceptions
11570         set_excepts = fetestexcept(FE_INVALID | FE_OVERFLOW);
11571         if (set_excepts & FE_INVALID) f();
11572         if (set_excepts & FE_OVERFLOW) g();
11573         /* ... */
11574     }
```

11575 **APPLICATION USAGE**

11576 None.

11577 **RATIONALE**

11578 None.

11579 **FUTURE DIRECTIONS**

11580 None.

11581 **SEE ALSO**

11582 *feclearexcept*( ), *fegetexceptflag*( ), *feraiseexcept*( ), the Base Definitions volume of
11583 IEEE Std. 1003.1-200x, **<fenv.h>**

11584 **CHANGE HISTORY**
11585 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

11586 **NAME**

11587 feupdateenv — update floating-point environment

11588 **SYNOPSIS**

11589
```
#include <fenv.h>
```

11590
```
void feupdateenv(const fenv_t *envp);
```

11591 **DESCRIPTION**

11592 CX The functionality described on this reference page is aligned with the ISO C standard. Any
11593 conflict between the requirements described here and the ISO C standard is unintentional. This
11594 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

11595 The *feupdateenv*( ) function shall save the currently raised floating-point exceptions in its
11596 automatic storage, install the floating-point environment represented by the object pointed to by
11597 *envp*, and then raise the saved floating-point exceptions. The argument *envp* shall point to an
11598 object set by a call to *feholdexcept*( ) or *fegetenv*( ), or equal a floating-point environment macro.

11599 **RETURN VALUE**

11600 None.

11601 **ERRORS**

11602 No errors are defined.

11603 **EXAMPLES**

11604 The following example shows sample code to hide spurious underflow floating-point
11605 exceptions:

```
11606   #include <fenv.h>
11607   double f(double x)
11608   {
11609       #pragma STDC FENV_ACCESS ON
11610       double result;
11611       fenv_t save_env;
11612       feholdexcept(&save_env);
11613       // compute result
11614       if (/* test spurious underflow */)
11615       feclearexcept(FE_UNDERFLOW);
11616       feupdateenv(&save_env);
11617       return result;
11618   }
```

11619 **APPLICATION USAGE**

11620 None.

11621 **RATIONALE**

11622 None.

11623 **FUTURE DIRECTIONS**

11624 None.

11625 **SEE ALSO**

11626 *fegetenv*( ), *feholdexcept*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<fenv.h>**

11627 **CHANGE HISTORY**

11628 First released in Issue 6. Derived from the ISO / IEC 9899: 1999 standard.

11629 **NAME**

11630 fflush — flush a stream

11631 **SYNOPSIS**

11632 `#include <stdio.h>`

11633 `int fflush(FILE *stream);`

11634 **DESCRIPTION**

11635 CX The functionality described on this reference page is aligned with the ISO C standard. Any
11636 conflict between the requirements described here and the ISO C standard is unintentional. This
11637 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

11638 If *stream* points to an output stream or an update stream in which the most recent operation was
11639 CX not input, *fflush*( ) causes any unwritten data for that stream to be written to the file, and the
11640 *st_ctime* and *st_mtime* fields of the underlying file are marked for update.

11641 If *stream* is a null pointer, *fflush*( ) shall perform this flushing action on all streams for which the
11642 behavior is defined above.

11643 **RETURN VALUE**

11644 Upon successful completion, *fflush*( ) shall return 0; otherwise, it shall set the error indicator for |
11645 CX the stream, return EOF, and set *errno* to indicate the error. |

11646 **ERRORS**

11647 The *fflush*( ) function shall fail if:

11648 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and the |
11649 process would be delayed in the write operation.

11650 CX [EBADF] The file descriptor underlying *stream* is not valid. |

11651 CX [EFBIG] An attempt was made to write a file that exceeds the maximum file size. |

11652 XSI [EFBIG] An attempt was made to write a file that exceeds the process' file size limit. |

11653 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the |
11654 offset maximum associated with the corresponding stream.

11655 CX [EINTR] The *fflush*( ) function was interrupted by a signal. |

11656 CX [EIO] The process is a member of a background process group attempting to write |
11657 to its controlling terminal, TOSTOP is set, the process is neither ignoring nor
11658 blocking SIGTTOU, and the process group of the process is orphaned. This
11659 error may also be returned under implementation-defined conditions. |

11660 CX [ENOSPC] There was no free space remaining on the device containing the file. |

11661 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by |
11662 any process. A SIGPIPE signal shall also be sent to the thread.

11663 The *fflush*( ) function may fail if:

11664 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the |
11665 capabilities of the device.

EXAMPLES

Sending Prompts to Standard Output

The following example uses *printf*( ) calls to print a series of prompts for information the user must enter from standard input. The *fflush*( ) calls force the output to standard output. The *fflush*( ) function is used because standard output is usually buffered and the prompt may not immediately be printed on the output or terminal. The *gets*( ) calls read strings from standard input and place the results in variables, for use later in the program

```
#include <stdio.h>
...
char user[100];
char oldpasswd[100];
char newpasswd[100];
...
printf("User name: ");
fflush(stdout);
gets(user);
printf("Old password: ");
fflush(stdout);
gets(oldpasswd);
printf("New password: ");
fflush(stdout);
gets(newpasswd);
...
```

APPLICATION USAGE

None.

RATIONALE

Data buffered by the system may make determining the validity of the position of the current file descriptor impractical. Thus, enforcing the repositioning of the file descriptor after *fflush*( ) on streams open for *read*( ) is not mandated by IEEE Std. 1003.1-200x.

FUTURE DIRECTIONS

None.

SEE ALSO

getrlimit( ), *ulimit*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdio.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The following change is incorporated for alignment with the ISO C standard:

- The DESCRIPTION is changed to describe the behavior of *fflush*( ) if *stream* is a null pointer.

The following changes are incorporated for alignment with the ISO POSIX-1 standard:

- The following two paragraphs are withdrawn from the DESCRIPTION (by POSIX as well as X/Open) because of the possibility of causing applications to malfunction, and the impossibility of implementing these mechanisms for pipes:

If the stream is open for reading, any unread data buffered in the stream is discarded.

For a stream open for reading, if the file is not already at EOF, and the file is one capable of seeking, the file offset of the underlying open file description is adjusted so that the next operation on the open file description deals with the byte after the last one read from, or written to, the stream being flushed.

- The [EFBIG] error is marked to indicate the extensions.

Issue 5

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are now marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EFBIG] error is added as part of the large file support extensions.
- The [ENXIO] optional error condition is added.

The RETURN VALUE section is updated to note that the error indicator shall be set for the stream. This is for alignment with the ISO/IEC 9899:1999 standard.

11724 **NAME**

11725 ffs — find first set bit

11726 ***Notes to Reviewers***

11727 *This section with side shading will not appear in the final copy. - Ed.*

11728 This function or these functions are recommended to become mandatory parts of POSIX.1 in the
11729 next draft.

11730 **SYNOPSIS**

11731 XSI
```
#include <strings.h>
```

11732
```
int ffs(int i);
```

11733

11734 **DESCRIPTION**

11735 The *ffs*( ) function shall find the first bit set (beginning with the least significant bit) in *i*, and
11736 return the index of that bit. Bits are numbered starting at one (the least significant bit).

11737 **RETURN VALUE**

11738 The *ffs*( ) function shall return the index of the first bit set. If *i* is 0, then *ffs*( ) shall return 0.

11739 **ERRORS**

11740 No errors are defined.

11741 **EXAMPLES**

11742 None.

11743 **APPLICATION USAGE**

11744 None.

11745 **RATIONALE**

11746 None.

11750 The Base Definitions volume of IEEE Std. 1003.1-200x, **<strings.h>**

11751 **CHANGE HISTORY**

11752 First released in Issue 4, Version 2.

11753 **Issue 5**

11754 Moved from X/OPEN UNIX extension to BASE.

11755 **NAME**

11756 fgetc — get a byte from a stream

11757 **SYNOPSIS**

11758 `#include <stdio.h>`

11759 `int fgetc(FILE *stream);`

11760 **DESCRIPTION**

11761 CX The functionality described on this reference page is aligned with the ISO C standard. Any
11762 conflict between the requirements described here and the ISO C standard is unintentional. This
11763 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

11764 If the end-of-file indicator for the input stream pointed to by *stream* is not set and a next
11765 character is present, the *fgetc*( ) function obtains the next byte (if present) as an **unsigned char**
11766 converted to an **int**, from the input stream pointed to by *stream*, and advances the associated file
11767 position indicator for the stream (if defined).

11768 CX The *fgetc*( ) function may mark the *st_atime* field of the file associated with *stream* for update. The
11769 *st_atime* field shall be marked for update by the first successful execution of *fgetc*( ), *fgets*( ),
11770 *fgetwc*( ), *fgetws*( ), *fread*( ), *fscanf*( ), *getc*( ), *getchar*( ), *gets*( ), or *scanf*( ) using *stream* that returns
11771 data not supplied by a prior call to *ungetc*( ) or *ungetwc*( ).

11772 **RETURN VALUE**

11773 Upon successful completion, *fgetc*( ) shall return the next byte from the input stream pointed to
11774 by *stream*. If the end-of-file indicator for the stream is set, or if the stream is at end-of-file, the
11775 end-of-file indicator for the stream shall be set and *fgetc*( ) shall return EOF. If a read error occurs,
11776 CX the error indicator for the stream shall be set, *fgetc*( ) shall return EOF, and shall set *errno* to
11777 indicate the error.

11778 **ERRORS**

11779 The *fgetc*( ) function shall fail if data needs to be read and:

11780 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and the
11781 process would be delayed in the *fgetc*( ) operation.

11782 CX [EBADF] The file descriptor underlying *stream* is not a valid file descriptor open for
11783 reading.

11784 CX [EINTR] The read operation was terminated due to the receipt of a signal, and no data
11785 was transferred.

11786 CX [EIO] A physical I/O error has occurred, or the process is in a background process
11787 group attempting to read from its controlling terminal, and either the process
11788 is ignoring or blocking the SIGTTIN signal or the process group is orphaned.
11789 This error may also be generated for implementation-defined reasons.

11790 CX [EOVERFLOW] The file is a regular file and an attempt was made to read at or beyond the
11791 offset maximum associated with the corresponding stream.

11792 The *fgetc*( ) function may fail if:

11793 CX [ENOMEM] Insufficient storage space is available.

11794 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
11795 capabilities of the device.

EXAMPLES

None.

APPLICATION USAGE

If the integer value returned by *fgetc*() is stored into a variable of type **char** and then compared against the integer constant EOF, the comparison may never succeed, because sign-extension of a variable of type **char** on widening to integer is implementation-defined.

The *ferror*() or *feof*() functions must be used to distinguish between an error condition and an end-of-file condition.

RATIONALE

None.

FUTURE DIRECTIONS

None.

feof(), *ferror*(), *fopen*(), *getchar*(), *getc*(), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdio.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

In the DESCRIPTION:

- The text is changed to make it clear that the function returns a byte value.
- The list of functions that may cause the *st_atime* field to be updated is revised.

In the ERRORS section, text is added to indicate that error returns are only generated when data needs to be read into the stream buffer.

Also in the ERRORS section, in previous issues generation of the [EIO] error depended on whether or not an implementation supported Job Control. This functionality is now defined as mandatory.

The [ENXIO] and [ENOMEM] errors are marked as extensions.

In the APPLICATION USAGE section, text is added to indicate how an application can distinguish between an error condition and an end-of-file condition.

The description of [EINTR] is amended.

Issue 4, Version 2

In the ERRORS section, the description of [EIO] is updated to include the case where a physical I/O error occurs.

Issue 5

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are now marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EIO] and [EOVERFLOW] mandatory error conditions are added.
- The [ENOMEM] and [ENXIO] optional error conditions are added.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The DESCRIPTION is updated to clarify the behavior when the end-of-file indicator for the input stream is not set.
- The RETURN VALUE section is updated to note that the error indicator shall be set for the stream.

11842 **NAME**

11843 fgetpos — get current file position information

11844 **SYNOPSIS**

11845 `#include <stdio.h>`

11846 `int fgetpos(FILE *restrict stream, fpos_t *restrict pos);`

11847 **DESCRIPTION**

11848 CX The functionality described on this reference page is aligned with the ISO C standard. Any
11849 conflict between the requirements described here and the ISO C standard is unintentional. This
11850 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

11851 The *fgetpos*( ) function shall store the current value of the file position indicator for the stream
11852 pointed to by *stream* in the object pointed to by *pos*. The value stored contains unspecified
11853 information usable by *fsetpos*( ) for repositioning the stream to its position at the time of the call
11854 to *fgetpos*( ).

11855 **RETURN VALUE**

11856 Upon successful completion, *fgetpos*( ) shall return 0; otherwise, it shall return a non-zero value
11857 and set *errno* to indicate the error.

11858 **ERRORS**

11859 The *fgetpos*( ) function shall fail if:

11860 CX [EOVERFLOW] The current value of the file position cannot be represented correctly in an
11861 object of type **fpos_t**.

11862 The *fgetpos*( ) function may fail if:

11863 CX [EBADF] The file descriptor underlying *stream* is not valid.

11864 CX [ESPIPE] The file descriptor underlying *stream* is associated with a pipe, FIFO, or socket.

11865

11866 **EXAMPLES**

11867 None.

11868 **APPLICATION USAGE**

11869 None.

11870 **RATIONALE**

11871 None.

11872 **FUTURE DIRECTIONS**

11873 None.

11874 **SEE ALSO**

11875 *fopen*( ), *ftell*( ), *rewind*( ), *ungetc*( ), the Base Definitions volume of IEEE Std. 1003.1-200x,
11876 **<stdio.h>**

11877 **CHANGE HISTORY**

11878 First released in Issue 4. Derived from the ISO C standard.

11879 **Issue 5**

11880 Large File Summit extensions are added.

11881 **Issue 6**

11882 Extensions beyond the ISO C standard are now marked.

11883 The following new requirements on POSIX implementations derive from alignment with the
11884 Single UNIX Specification:

- The [EIO] mandatory error condition is added.
- The [EBADF] and [ESPIPE] optional error conditions are added.

An additional [ESPIPE] error condition is added for sockets. |

The prototype for *fgetpos*( ) is changed for alignment with the ISO / IEC 9899: 1999 standard. |

11889 **NAME**

11890 fgets — get a string from a stream

11891 **SYNOPSIS**

11892 ```
#include <stdio.h>
```

11893 ```
char *fgets(char *restrict s, int n, FILE *restrict stream);
```

11894 **DESCRIPTION**

11895 CX The functionality described on this reference page is aligned with the ISO C standard. Any
11896 conflict between the requirements described here and the ISO C standard is unintentional. This
11897 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

11898 The *fgets*( ) function shall read bytes from *stream* into the array pointed to by *s*, until *n*−1 bytes
11899 are read, or a <newline> character is read and transferred to *s*, or an end-of-file condition is
11900 encountered. The string is then terminated with a null byte.

11901 CX The *fgets*( ) function may mark the *st_atime* field of the file associated with *stream* for update. The
11902 *st_atime* field shall be marked for update by the first successful execution of *fgetc*( ), *fgets*( ),
11903 *fgetwc*( ), *fgetws*( ), *fread*( ), *fscanf*( ), *getc*( ), *getchar*( ), *gets*( ), or *scanf*( ) using *stream* that returns
11904 data not supplied by a prior call to *ungetc*( ) or *ungetwc*( ).

11905 **RETURN VALUE**

11906 Upon successful completion, *fgets*( ) shall return *s*. If the stream is at end-of-file, the end-of-file
11907 indicator for the stream shall be set and *fgets*( ) shall return a null pointer. If a read error occurs,
11908 CX the error indicator for the stream shall be set, *fgets*( ) shall return a null pointer, and shall set
11909 *errno* to indicate the error.

11910 **ERRORS**

11911 Refer to *fgetc*( ).

11912 **EXAMPLES**

11913 **Reading Input**

11914 The following example uses *fgets*( ) to read each line of input. {LINE_MAX}, which defines the
11915 maximum size of the input line, is defined in the **<limits.h>** header.

11916 ```
#include <stdio.h>
11917 ...
11918 char line[LINE_MAX];
11919 ...
11920 while (fgets(line, LINE_MAX, fp) != NULL) {
11921 ...
11922 }
11923 ...
```

11924 **APPLICATION USAGE**

11925 None.

11926 **RATIONALE**

11927 None.

11928 **FUTURE DIRECTIONS**

11929 None.
```

11930 **SEE ALSO**

11931 *fopen*( ), *fread*( ), *gets*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdio.h>**

11932 **CHANGE HISTORY**

11933 First released in Issue 1. Derived from Issue 1 of the SVID.

11934 **Issue 4**

11935 In the DESCRIPTION, the text is changed to make it clear that the function reads bytes rather
11936 than (possibly multi-byte) characters, and the list of functions that may cause the *st_atime* field to
11937 be updated is revised.

11938 **Issue 6**

11939 Extensions beyond the ISO C standard are now marked.

11940 The prototype for *fgets*( ) is changed for alignment with the ISO / IEC 9899: 1999 standard.

11941 **NAME**

11942 fgetwc — get a wide-character code from a stream

11943 **SYNOPSIS**

11944 ```
#include <stdio.h>
```

11945 ```
#include <wchar.h>
```

11946 ```
wint_t fgetwc(FILE *stream);
```

11947 **DESCRIPTION**

11948 CX The functionality described on this reference page is aligned with the ISO C standard. Any
11949 conflict between the requirements described here and the ISO C standard is unintentional. This
11950 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

11951 The *fgetwc*( ) function shall obtain the next character (if present) from the input stream pointed to
11952 by *stream*, convert that to the corresponding wide-character code, and advance the associated
11953 file position indicator for the stream (if defined).

11954 If an error occurs, the resulting value of the file position indicator for the stream is
11955 indeterminate.

11956 CX The *fgetwc*( ) function may mark the *st_atime* field of the file associated with *stream* for update.
11957 The *st_atime* field shall be marked for update by the first successful execution of *fgetc*( ), *fgets*( ),
11958 *fgetwc*( ), *fgetws*( ), *fread*( ), *fscanf*( ), *getc*( ), *getchar*( ), *gets*( ), or *scanf*( ) using *stream* that returns
11959 data not supplied by a prior call to *ungetc*( ) or *ungetwc*( ).

11960 **RETURN VALUE**

11961 Upon successful completion, the *fgetwc*( ) function shall return the wide-character code of the
11962 character read from the input stream pointed to by *stream* converted to a type **wint_t**. If the
11963 stream is at end-of-file, the end-of-file indicator for the stream shall be set and *fgetwc*( ) shall
11964 return WEOF. If a read error occurs, the error indicator for the stream shall be set, *fgetwc*( ) shall
11965 CX return WEOF, and shall set *errno* to indicate the error.

11966 **ERRORS**

11967 The *fgetwc*( ) function shall fail if data needs to be read and:

11968 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and the process would be delayed in the *fgetwc*( ) operation.

11970 CX [EBADF] The file descriptor underlying *stream* is not a valid file descriptor open for reading.

11972 CX [EINTR] The read operation was terminated due to the receipt of a signal, and no data was transferred.

11974 CX [EIO] A physical I/O error has occurred, or the process is in a background process group attempting to read from its controlling terminal, and either the process is ignoring or blocking the SIGTTIN signal or the process group is orphaned. This error may also be generated for implementation-defined reasons.

11978 CX [EOVERFLOW] The file is a regular file and an attempt was made to read at or beyond the offset maximum associated with the corresponding stream.

11980 The *fgetwc*( ) function may fail if:

11981 CX [ENOMEM] Insufficient storage space is available.

11982 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the capabilities of the device.
```

11984 CX [EILSEQ] The data obtained from the input stream does not form a valid character.

11985 **EXAMPLES**

11986 None.

11987 **APPLICATION USAGE**

11988 The *ferror*( ) or *feof*( ) functions must be used to distinguish between an error condition and an
11989 end-of-file condition.

11990 **RATIONALE**

11991 None.

11992 **FUTURE DIRECTIONS**

11993 None.

11994 **SEE ALSO**

11995 *feof*( ), *ferror*( ), *fopen*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdio.h>**,
11996 **<wchar.h>**

11997 **CHANGE HISTORY**

11998 First released in Issue 4. Derived from the MSE working draft.

11999 **Issue 4, Version 2**

12000 In the ERRORS section, the description of [EIO] is updated to include the case where a physical
12001 I/O error occurs.

12002 **Issue 5**

12003 The Optional Header (OH) marking is removed from **<stdio.h>**.

12004 Large File Summit extensions are added.

12005 **Issue 6**

12006 Extensions beyond the ISO C standard are now marked.

12007 The following new requirements on POSIX implementations derive from alignment with the
12008 Single UNIX Specification:

12009 - The [EIO] and [EOVERFLOW] mandatory error conditions are added.

12010 - The [ENOMEM], [ENXIO], and [EILSEQ] optional error conditions are added.

12011 **NAME**

12012 fgetws — get a wide-character string from a stream

12013 **SYNOPSIS**

12014 ```
#include <stdio.h>
```

12015 ```
#include <wchar.h>
```

12016 ```
wchar_t *fgetws(wchar_t *restrict ws, int n,
```

12017 ```
    FILE *restrict stream);
```

12018 **DESCRIPTION**

12019 CX The functionality described on this reference page is aligned with the ISO C standard. Any
12020 conflict between the requirements described here and the ISO C standard is unintentional. This
12021 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

12022 The *fgetws*( ) function shall read characters from the *stream*, convert these to the corresponding
12023 wide-character codes, place them in the **wchar_t** array pointed to by *ws*, until *n*−1 characters are
12024 read, or a <newline> character is read, converted, and transferred to *ws*, or an end-of-file
12025 condition is encountered. The wide-character string, *ws*, is then terminated with a null wide-
12026 character code.

12027 If an error occurs, the resulting value of the file position indicator for the stream is
12028 indeterminate.

12029 CX The *fgetws*( ) function may mark the *st_atime* field of the file associated with *stream* for update.
12030 The *st_atime* field shall be marked for update by the first successful execution of *fgetc*( ), *fgets*( ),
12031 *fgetwc*( ), *fgetws*( ), *fread*( ), *fscanf*( ), *getc*( ), *getchar*( ), *gets*( ), or *scanf*( ) using *stream* that returns
12032 data not supplied by a prior call to *ungetc*( ) or *ungetwc*( ).

12033 **RETURN VALUE**

12034 Upon successful completion, *fgetws*( ) shall return *ws*. If the stream is at end-of-file, the end-of-
12035 file indicator for the stream shall be set and *fgetws*( ) shall return a null pointer. If a read error
12036 CX occurs, the error indicator for the stream shall be set, *fgetws*( ) shall return a null pointer, and
12037 shall set *errno* to indicate the error.

12038 **ERRORS**

12039 Refer to *fgetwc*( ).

12040 **EXAMPLES**

12041 None.

12042 **APPLICATION USAGE**

12043 None.

12044 **RATIONALE**

12045 None.

12046 **FUTURE DIRECTIONS**

12047 None.

12048 **SEE ALSO**

12049 *fopen*( ), *fread*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdio.h>**, **<wchar.h>**

12050 **CHANGE HISTORY**

12051 First released in Issue 4. Derived from the MSE working draft.

12052 **Issue 5**

12053 The Optional Header (OH) marking is removed from **<stdio.h>**.

12054 **Issue 6**

12055 Extensions beyond the ISO C standard are now marked. |

12056 The prototype for *fgetws*( ) is changed for alignment with the ISO / IEC 9899: 1999 standard. |

12057 **NAME**

12058 fileno — map a stream pointer to a file descriptor

12059 **SYNOPSIS**

12060 `#include <stdio.h>`

12061 `int fileno(FILE *stream);`

12062 **DESCRIPTION**

12063 The *fileno*( ) function shall return the integer file descriptor associated with the stream pointed to
12064 by *stream*.

12065 **RETURN VALUE**

12066 Upon successful completion, *fileno*( ) shall return the integer value of the file descriptor
12067 associated with *stream*. Otherwise, the value –1 shall be returned and *errno* set to indicate the
12068 error.

12069 **ERRORS**

12070 The *fileno*( ) function may fail if:

12071 [EBADF] The *stream* argument is not a valid stream. |

12072 **EXAMPLES**

12073 None.

12074 **APPLICATION USAGE**

12075 None.

12076 **RATIONALE**

12077 Without some specification of which file descriptors are associated with these streams, it is
12078 impossible for an application to set up the streams for another application it starts with *fork*( )
12079 and *exec*. In particular, it would not be possible to write a portable version of the *sh* command
12080 interpreter (although there may be other constraints that would prevent that portability).

12081 **FUTURE DIRECTIONS**

12082 None.

12083 **SEE ALSO**

12084 *fdopen*( ), *fopen*( ), *stdin*, the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdio.h>**, Section |
12085 2.5.1 (on page 535)

12086 **CHANGE HISTORY**

12087 First released in Issue 1. Derived from Issue 1 of the SVID. |

12088 **Issue 4**

12089 The [EBADF] error is marked as an extension.

12090 **Issue 6**

12091 The following new requirements on POSIX implementations derive from alignment with the
12092 Single UNIX Specification:

12093 • The [EBADF] optional error condition is added.

12094 **NAME**

12095 flockfile, ftrylockfile, funlockfile — stdio locking functions

12096 **SYNOPSIS**

12097 TSF
```
#include <stdio.h>

void flockfile(FILE *file);
int ftrylockfile(FILE *file);
void funlockfile(FILE *file);
```
12101

12102 **DESCRIPTION**

12103 The *flockfile*( ), *ftrylockfile*( ), and *funlockfile*( ) functions provide for explicit application-level
12104 locking of stdio (**FILE***) objects. These functions can be used by a thread to delineate a sequence
12105 of I/O statements that are executed as a unit.

12106 The *flockfile*( ) function is used by a thread to acquire ownership of a (**FILE***) object.

12107 The *ftrylockfile*( ) function is used by a thread to acquire ownership of a (**FILE***) object if the
12108 object is available; *ftrylockfile*( ) is a non-blocking version of *flockfile*( ).

12109 The *funlockfile*( ) function is used to relinquish the ownership granted to the thread. The
12110 behavior is undefined if a thread other than the current owner calls the *funlockfile*( ) function.

12111 Logically, there is a lock count associated with each (**FILE***) object. This count is implicitly
12112 initialized to zero when the (**FILE***) object is created. The (**FILE***) object is unlocked when the
12113 count is zero. When the count is positive, a single thread owns the (**FILE***) object. When the
12114 *flockfile*( ) function is called, if the count is zero or if the count is positive and the caller owns the
12115 (**FILE***) object, the count is incremented. Otherwise, the calling thread is suspended, waiting for
12116 the count to return to zero. Each call to *funlockfile*( ) decrements the count. This allows matching
12117 calls to *flockfile*( ) (or successful calls to *ftrylockfile*( )) and *funlockfile*( ) to be nested.

12118 All functions that reference (**FILE***) objects shall behave as if they use *flockfile*( ) and *funlockfile*( )
12119 internally to obtain ownership of these (**FILE***) objects.

12120 **RETURN VALUE**

12121 None for *flockfile*( ) and *funlockfile*( ). The *ftrylockfile*( ) function shall return zero for success and
12122 non-zero to indicate that the lock cannot be acquired.

12123 **ERRORS**

12124 No errors are defined.

12125 **EXAMPLES**

12126 None.

12127 **APPLICATION USAGE**

12128 Applications using these functions may be subject to priority inversion, as discussed in the Base
12129 Definitions volume of IEEE Std. 1003.1-200x, Section 3.287, Priority Inversion.

12130 **RATIONALE**

12131 The *flockfile*( ) and *funlockfile*( ) functions provide an orthogonal mutual exclusion lock for each
12132 **FILE**. The *ftrylockfile*( ) function provides a non-blocking attempt to acquire a file lock,
12133 analogous to *pthread_mutex_trylock*( ).

12134 These locks behave as if they are the same as those used internally by *stdio* for thread-safety.
12135 This both provides thread-safety of these functions without requiring a second level of internal
12136 locking and allows functions in *stdio* to be implemented in terms of other *stdio* functions.

12137 Application writers and implementors should be aware that there are potential deadlock
12138 problems on **FILE** objects. For example, the line-buffered flushing semantics of *stdio* (requested

12139 via {_IOLBF}) require that certain input operations sometimes cause the buffered contents of |
12140 implementation-defined line-buffered output streams to be flushed. If two threads each hold the |
12141 lock on the other's **FILE**, deadlock ensues. This type of deadlock can be avoided by acquiring
12142 **FILE** locks in a consistent order. In particular, the line-buffered output stream deadlock can
12143 typically be avoided by acquiring locks on input streams before locks on output streams if a
12144 thread would be acquiring both.

12145 In summary, threads sharing *stdio* streams with other threads can use *flockfile*( ) and *funlockfile*( )
12146 to cause sequences of I/O performed by a single thread to be kept bundled. The only case where
12147 the use of *flockfile*( ) and *funlockfile*( ) is required is to provide a scope protecting uses of the
12148 **_unlocked*( ) functions/macros. This moves the cost/performance tradeoff to the optimal point.

12149 **FUTURE DIRECTIONS**

12150 None.

12151 **SEE ALSO**

12152 *getc_unlocked*( ), *putc_unlocked*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdio.h>** |

12153 **CHANGE HISTORY**

12154 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

12155 **Issue 6**

12156 These functions are marked as part of the Thread-Safe Functions option. |

12157 **NAME**

12158 floor, floorf, floorl — floor function

12159 **SYNOPSIS**

12160
```
#include <math.h>
```

12161
```
double floor(double x);
```
12162
```
float floorf(float x);
```
12163
```
long double floorl(long double x);
```

12164 **DESCRIPTION**

12165 CX The functionality described on this reference page is aligned with the ISO C standard. Any
12166 conflict between the requirements described here and the ISO C standard is unintentional. This
12167 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

12168 These functions shall compute the largest integral value not greater than *x*.

12169 An application wishing to check for error situations should set *errno* to 0 before calling *floor*(). If
12170 *errno* is non-zero on return, or the return value is NaN, an error has occurred.

12171 **RETURN VALUE**

12172 Upon successful completion, these functions shall return the largest integral value not greater
12173 than *x*, expressed as a **double**.

12174 XSI If *x* is NaN, NaN shall be returned and *errno* may be set to [EDOM].

12175 If the correct value would cause overflow, −HUGE_VAL shall be returned and *errno* set to
12176 [ERANGE].

12177 XSI If *x* is ±Inf or ±0, the value of *x* shall be returned.

12178 **ERRORS**

12179 These functions shall fail if:

12180 [ERANGE] The result would cause an overflow.

12181 These functions may fail if:

12182 XSI [EDOM] The value of *x* is NaN.

12183 XSI No other errors shall occur.

12184 **EXAMPLES**

12185 None.

12186 **APPLICATION USAGE**

12187 The integral value returned by *floor*() as a **double** might not be expressible as an **int** or **long**. The
12188 return value should be tested before assigning it to an integer type to avoid the undefined results
12189 of an integer overflow.

12190 The *floor*() function can only overflow when the floating point representation has
12191 DBL_MANT_DIG > DBL_MAX_EXP.

12192 **RATIONALE**

12193 None.

12194 **FUTURE DIRECTIONS**

12195 None.

12196 **SEE ALSO**

12197 *ceil*( ), *isnan*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<math.h>**

12198 **CHANGE HISTORY**

12199 First released in Issue 1. Derived from Issue 1 of the SVID.

12200 **Issue 4**

12201 References to *matherr*( ) are removed.

12202 The RETURN VALUE and ERRORS sections are substantially rewritten for alignment with the
12203 ISO C standard and to rationalize handling in the mathematics functions.

12204 The word **long** has been replaced with the words **long** in the APPLICATION USAGE section.

12205 The return value specified for [EDOM] is marked as an extension.

12206 **Issue 5**

12207 The DESCRIPTION is updated to indicate how an application should check for an error. This
12208 text was previously published in the APPLICATION USAGE section.

12209 **Issue 6**

12210 The *floorf*( ) and *floorl*( ) functions are added for alignment with the ISO / IEC 9899: 1999 standard.

NAME

fma, fmaf, fmal — floating-point multiply-add

SYNOPSIS

```
#include <math.h>

double fma(double x, double y, double z);
float fmaf(float x, float y, float z);
long double fmal(long double x, long double y, long double z);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

These functions shall compute $(x * y) + z$, rounded as one ternary operation: they shall compute the value (as if) to infinite precision and round once to the result format, according to the rounding mode characterized by the value of FLT_ROUNDS.

An application wishing to check for error situations should set *errno* to 0 before calling these functions. If *errno* is non-zero on return, or the return value is NaN, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return $(x * y) + z$, rounded as one ternary operation.

If *x*, *y*, or *z* is NaN, NaN shall be returned and *errno* may be set to [EDOM].

ERRORS

These functions may fail if:

[EDOM] The value of *x*, *y*, or *z* is NaN.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

In many cases, clever use of floating (*fused*) multiply-add leads to much improved code; but its unexpected use by the compiler can undermine carefully written code. The FP_CONTRACT macro can be used to disallow use of floating multiply-add; and the *fma*() function guarantees its use where desired. Many current machines provide hardware floating multiply-add instructions; software implementation can be used for others.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the ISO / IEC 9899: 1999 standard.

12250 **NAME**

12251 fmax, fmaxf, fmaxl — determine maximum numeric value of two floating-point numbers

12252 **SYNOPSIS**

12253
```
#include <math.h>
```

12254
```
double fmax(double x, double y);
```
12255
```
float fmaxf(float x, float y);
```
12256
```
long double fmaxl(long double x, long double y);
```

12257 **DESCRIPTION**

12258 CX The functionality described on this reference page is aligned with the ISO C standard. Any
12259 conflict between the requirements described here and the ISO C standard is unintentional. This
12260 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

12261 These functions shall determine the maximum numeric value of their arguments. NaN
12262 arguments shall be treated as missing data: if one argument is a NaN and the other numeric,
12263 then the *fmax*( ), *fmaxf*( ), and *fmaxl*( ) functions shall choose the numeric value.

12264 An application wishing to check for error situations should set *errno* to 0 before calling these
12265 functions. If *errno* is non-zero on return, or the return value is NaN, an error has occurred.

12266 **RETURN VALUE**

12267 Upon successful completion, these functions shall return the maximum numeric value of their
12268 arguments.

12269 If *x* and *y* are NaN, NaN shall be returned and *errno* may be set to [EDOM].

12270 **ERRORS**

12271 These functions may fail if:

12272 [EDOM] The value of *x* and *y* is NaN.

12273 **EXAMPLES**

12274 None.

12275 **APPLICATION USAGE**

12276 None.

12277 **RATIONALE**

12278 None.

12279 **FUTURE DIRECTIONS**

12280 None.

NAME

fmin, fminf, fminl — determine minimum numeric value of two floating-point numbers

SYNOPSIS

```
#include <math.h>

double fmin(double x, double y);
float fminf(float x, float y);
long double fminl(long double x, long double y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

These functions shall determine the minimum numeric value of their arguments. NaN arguments shall be treated as missing data: if one argument is a NaN and the other numeric, then these functions shall choose the numeric value.

An application wishing to check for error situations should set *errno* to 0 before calling these functions. If *errno* is non-zero on return, or the return value is NaN, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the minimum numeric value of their arguments.

If *x* and *y* are NaN, NaN shall be returned and *errno* may be set to [EDOM].

ERRORS

These functions may fail if:

[EDOM] The value of *x* and *y* is NaN.

CHANGE HISTORY

First released in Issue 6. Derived from ISO / IEC 9899: 1999 standard.

12320 **NAME**

12321 fmod, fmodf, fmodl — floating-point remainder value function

12322 **SYNOPSIS**

12323
```
#include <math.h>
```

12324
```
double fmod(double x, double y);
```
12325
```
float fmodf(float x, float y);
```
12326
```
long double fmodl(long double x, long double y);
```

12327 **DESCRIPTION**

12328 CX The functionality described on this reference page is aligned with the ISO C standard. Any
12329 conflict between the requirements described here and the ISO C standard is unintentional. This
12330 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

12331 These functions shall return the floating-point remainder of the division of *x* by *y*.

12332 An application wishing to check for error situations should set *errno* to 0 before calling *fmod*( ). If
12333 *errno* is non-zero on return, or the return value is NaN, an error has occurred.

12334 **RETURN VALUE**

12335 These functions shall return the value $x-i*y$, for some integer i such that, if y is non-zero, the
12336 result has the same sign as x and magnitude less than the magnitude of y.

12337 XSI If *x* or *y* is NaN, NaN shall be returned and *errno* may be set to [EDOM].

12338 XSI If *y* is 0, NaN shall be returned and *errno* set to [EDOM], or 0 shall be returned and *errno* may be
12339 set to [EDOM].

12340 XSI If *x* is ±Inf, either 0 shall be returned and *errno* set to [EDOM], or NaN shall be returned and *errno*
12341 may be set to [EDOM].

12342 If *y* is non-zero, *fmod*(±0,*y*) shall return the value of *x*. If *x* is not ±Inf, *fmod*(*x*,±Inf) shall return
12343 the value of *x*.

12344 If the result underflows, 0 shall be returned and *errno* may be set to [ERANGE].

12345 **ERRORS**

12346 These functions may fail if:

12347 XSI [EDOM] One or both of the arguments is NaN, or *y* is 0, or *x* is ±Inf.

12348 [ERANGE] The result underflows

12349 XSI No other errors shall occur.

12350 **EXAMPLES**

12351 None.

12352 **APPLICATION USAGE**

12353 Portable applications should not call *fmod*( ) with *y* equal to 0, because the result is
12354 implementation-defined. The application should verify *y* is non-zero before calling *fmod*( ).

12355 **RATIONALE**

12356 None.

12357 **FUTURE DIRECTIONS**

12358 None.

12359 **SEE ALSO**

12360 *isnan*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<math.h>**

12361 **CHANGE HISTORY**

12362 First released in Issue 1. Derived from Issue 1 of the SVID.

12363 **Issue 4**

12364 References to *matherr*( ) are removed.

12365 The RETURN VALUE and ERRORS sections are substantially rewritten for alignment with the
12366 ISO C standard and to rationalize error handling in the mathematics functions.

12367 The return value specified for [EDOM] is marked as an extension.

12368 **Issue 5**

12369 The DESCRIPTION is updated to indicate how an application should check for an error. This
12370 text was previously published in the APPLICATION USAGE section.

12371 **Issue 6**

12372 The *fmodf*( ) and *fmodl*( ) functions are added for alignment with the ISO/IEC 9899:1999
12373 standard.

12374 **NAME**

12375 fmtmsg — display a message in the specified format on standard error and/or a system console

12376 **SYNOPSIS**

12377 XSI
```
#include <fmtmsg.h>

int fmtmsg(long classification, const char *label, int severity,
    const char *text, const char *action, const char *tag);
```
12380

12381 **DESCRIPTION**

12382 The *fmtmsg*( ) function can be used to display messages in a specified format instead of the
12383 traditional *printf*( ) function.

12384 Based on a message's classification component, *fmtmsg*( ) writes a formatted message either to
12385 standard error, to the console, or to both.

12386 A formatted message consists of up to five components as defined below. The component
12387 *classification* is not part of a message displayed to the user, but defines the source of the message
12388 and directs the display of the formatted message.

12389 *classification* Contains identifiers from the following groups of major classifications and
12390 subclassifications. Any one identifier from a subclass may be used in
12391 combination with a single identifier from a different subclass. Two or more
12392 identifiers from the same subclass should not be used together, with the
12393 exception of identifiers from the display subclass. (Both display subclass
12394 identifiers may be used so that messages can be displayed to both standard
12395 error and the system console).

12396 **Major Classifications**

12397 Identifies the source of the condition. Identifiers are: MM_HARD
12398 (hardware), MM_SOFT (software), and MM_FIRM (firmware).

12399 **Message Source Subclassifications**

12400 Identifies the type of software in which the problem is detected.
12401 Identifiers are: MM_APPL (application), MM_UTIL (utility), and
12402 MM_OPSYS (operating system).

12403 **Display Subclassifications**

12404 Indicates where the message is to be displayed. Identifiers are:
12405 MM_PRINT to display the message on the standard error stream,
12406 MM_CONSOLE to display the message on the system console. One or
12407 both identifiers may be used.

12408 **Status Subclassifications**

12409 Indicates whether the application can recover from the condition.
12410 Identifiers are: MM_RECOVER (recoverable) and MM_NRECOV (non-
12411 recoverable).

12412 An additional identifier, MM_NULLMC, indicates that no classification
12413 component is supplied for the message.

12414 *label* Identifies the source of the message. The format is two fields separated by a
12415 colon. The first field is up to 10 bytes, the second is up to 14 bytes.

12416 *severity* Indicates the seriousness of the condition. Identifiers for the levels of *severity*
12417 are:

MM_HALT Indicates that the application has encountered a severe fault and is halting. Produces the string "HALT".

MM_ERROR Indicates that the application has detected a fault. Produces the string "ERROR".

MM_WARNING Indicates a condition that is out of the ordinary, that might be a problem, and should be watched. Produces the string "WARNING".

MM_INFO Provides information about a condition that is not in error. Produces the string "INFO".

MM_NOSEV Indicates that no severity level is supplied for the message.

text Describes the error condition that produced the message. The character string is not limited to a specific size. If the character string is empty, then the text produced is unspecified.

action Describes the first step to be taken in the error-recovery process. The *fmtmsg*( ) function precedes the action string with the prefix: "TO FIX:". The *action* string is not limited to a specific size.

tag An identifier that references on-line documentation for the message. Suggested usage is that *tag* includes the *label* and a unique identifying number. A sample *tag* is "XSI:cat:146".

The *MSGVERB* environment variable (for message verbosity) tells *fmtmsg*( ) which message components it is to select when writing messages to standard error. The value of *MSGVERB* is a colon-separated list of optional keywords. Valid *keywords* are: *label*, *severity*, *text*, *action*, and *tag*. If *MSGVERB* contains a keyword for a component and the component's value is not the component's null value, *fmtmsg*( ) includes that component in the message when writing the message to standard error. If *MSGVERB* does not include a keyword for a message component, that component is not included in the display of the message. The keywords may appear in any order. If *MSGVERB* is not defined, if its value is the null string, if its value is not of the correct format, or if it contains keywords other than the valid ones listed above, *fmtmsg*( ) selects all components.

MSGVERB affects only which components are selected for display to standard error. All message components are included in console messages.

RETURN VALUE

The *fmtmsg*( ) function shall return one of the following values:

MM_OK The function succeeded.

MM_NOTOK The function failed completely.

MM_NOMSG The function was unable to generate a message on standard error, but otherwise succeeded.

MM_NOCON The function was unable to generate a console message, but otherwise succeeded.

ERRORS

None.

12459 **EXAMPLES**

12460 1. The following example of *fmtmsg*( ):

12461 ```
fmtmsg(MM_PRINT, "XSI:cat", MM_ERROR, "illegal option",
12462 "refer to cat in user's reference manual", "XSI:cat:001")
```

12463 produces a complete message in the specified message format:

12464 ```
XSI:cat: ERROR: illegal option
12465 TO FIX: refer to cat in user's reference manual XSI:cat:001
```

12466 2. When the environment variable *MSGVERB* is set as follows:

12467 ```
MSGVERB=severity:text:action
```

12468 and Example 1 is used, *fmtmsg*( ) produces:

12469 ```
ERROR: illegal option
12470 TO FIX: refer to cat in user's reference manual
```

12471 **APPLICATION USAGE**

12472 One or more message components may be systematically omitted from messages generated by
12473 an application by using the null value of the argument for that component.

12474 **RATIONALE**

12475 None.

12476 **FUTURE DIRECTIONS**

12477 None.

12478 **SEE ALSO**

12479 *printf*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<fmtmsg.h>** |

12480 **CHANGE HISTORY**

12481 First released in Issue 4, Version 2.

12482 **Issue 5**

12483 Moved from X/OPEN UNIX extension to BASE.

12484 **NAME**

12485 fnmatch — match a file name or a path name

12486 **SYNOPSIS**

12487 `#include <fnmatch.h>`

12488 `int fnmatch(const char *`*`pattern`*`, const char *`*`string`*`, int `*`flags`*`);`

12489 **DESCRIPTION**

12490 The *fnmatch*( ) function shall match patterns as described in the Shell and Utilities volume of
12491 IEEE Std. 1003.1-200x, Section 2.14.1, Patterns Matching a Single Character, and Section 2.14.2,
12492 Patterns Matching Multiple Characters. It checks the string specified by the *string* argument to
12493 see if it matches the pattern specified by the *pattern* argument.

12494 The *flags* argument modifies the interpretation of *pattern* and *string*. It is the bitwise-inclusive OR
12495 of zero or more of the flags defined in **<fnmatch.h>**. If the FNM_PATHNAME flag is set in *flags*,
12496 then a slash character (`'/'`) in *string* shall be explicitly matched by a slash in *pattern*; it shall not
12497 be matched by either the asterisk or question-mark special characters, nor by a bracket
12498 expression. If the FNM_PATHNAME flag is not set, the slash character is treated as an ordinary
12499 character.

12500 If FNM_NOESCAPE is not set in *flags*, a backslash character (`'\'`) in *pattern* followed by any
12501 other character shall match that second character in *string*. In particular, `"\\"` shall match a
12502 backslash in *string*. If FNM_NOESCAPE is set, a backslash character shall be treated as an
12503 ordinary character.

12504 If FNM_PERIOD is set in *flags*, then a leading period (`'.'`) in *string* shall match a period in
12505 *pattern*; as described by rule 2 in the Shell and Utilities volume of IEEE Std. 1003.1-200x, Section
12506 2.14.3, Patterns Used for File Name Expansion where the location of ‘‘leading’’ is indicated by
12507 the value of FNM_PATHNAME:

12508 • If FNM_PATHNAME is set, a period is ‘‘leading’’ if it is the first character in *string* or if it
12509 immediately follows a slash.

12510 • If FNM_PATHNAME is not set, a period is ‘‘leading’’ only if it is the first character of *string*.

12511 If FNM_PERIOD is not set, then no special restrictions are placed on matching a period.

12512 **RETURN VALUE**

12513 If *string* matches the pattern specified by *pattern*, then *fnmatch*( ) shall return 0. If there is no
12514 match, *fnmatch*( ) shall return FNM_NOMATCH, which is defined in **<fnmatch.h>**. If an error
12515 occurs, *fnmatch*( ) shall return another non-zero value.

12516 **ERRORS**

12517 No errors are defined.

12518 **EXAMPLES**

12519 None.

12520 **APPLICATION USAGE**

12521 The *fnmatch*( ) function has two major uses. It could be used by an application or utility that
12522 needs to read a directory and apply a pattern against each entry. The *find* utility is an example of
12523 this. It can also be used by the *pax* utility to process its *pattern* operands, or by applications that
12524 need to match strings in a similar manner.

12525 The name *fnmatch*( ) is intended to imply *file name* match, rather than *path name* match. The
12526 default action of this function is to match file names, rather than path names, since it gives no
12527 special significance to the slash character. With the FNM_PATHNAME flag, *fnmatch*( ) does
12528 match path names, but without tilde expansion, parameter expansion, or special treatment for a

period at the beginning of a file name.

RATIONALE

This function replaced the REG_FILENAME flag of *regcomp*( ) in early proposals of this volume of IEEE Std. 1003.1-200x. It provides virtually the same functionality as the *regcomp*( ) and *regexec*( ) functions using the REG_FILENAME and REG_FSLASH flags (the REG_FSLASH flag was proposed for *regcomp*( ), and would have had the opposite effect from FNM_PATHNAME), but with a simpler function and less system overhead.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4. Derived from the ISO POSIX-2 standard.

Issue 5

Moved from POSIX2 C-language Binding to BASE.

12545 **NAME**

12546 fopen — open a stream

12547 **SYNOPSIS**

12548 `#include <stdio.h>`

12549 `FILE *fopen(const char *restrict filename, const char *restrict mode);`

12550 **DESCRIPTION**

12551 CX The functionality described on this reference page is aligned with the ISO C standard. Any
12552 conflict between the requirements described here and the ISO C standard is unintentional. This
12553 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

12554 The *fopen*( ) function shall open the file whose path name is the string pointed to by *filename*, and
12555 associates a stream with it.

12556 The argument *mode* points to a string. If the string is one of the following, the file is open in the
12557 indicated mode. Otherwise, the behavior is undefined.

12558 *r* or *rb*	Open file for reading.
12559 *w* or *wb*	Truncate to zero length or create file for writing.
12560 *a* or *ab*	Append; open or create file for writing at end-of-file.
12561 *r+* or *rb+* or *r+b*	Open file for update (reading and writing).
12562 *w+* or *wb+* or *w+b*	Truncate to zero length or create file for update.
12563 *a+* or *ab+* or *a+b*	Append; open or create file for update, writing at end-of-file.

12564 CX The character `'b'` has no effect, but is allowed for ISO C standard conformance. Opening a file
12565 with read mode (*r* as the first character in the *mode* argument) shall fail if the file does not exist or
12566 cannot be read.

12567 Opening a file with append mode (*a* as the first character in the *mode* argument) shall cause all
12568 subsequent writes to the file to be forced to the then current end-of-file, regardless of intervening
12569 calls to *fseek*( ).

12570 When a file is opened with update mode (`'+'` as the second or third character in the *mode*
12571 argument), both input and output may be performed on the associated stream. However, the
12572 application shall ensure that output is not directly followed by input without an intervening call
12573 to *fflush*( ) or to a file positioning function (*fseek*( ), *fsetpos*( ), or *rewind*( )), and input is not directly
12574 followed by output without an intervening call to a file positioning function, unless the input
12575 operation encounters end-of-file.

12576 When opened, a stream is fully buffered if and only if it can be determined not to refer to an
12577 interactive device. The error and end-of-file indicators for the stream shall be cleared.

12578 CX If *mode* is *w*, *a*, *w+*, or *a+*, and the file did not previously exist, upon successful completion,
12579 *fopen*( ) function shall mark for update the *st_atime*, *st_ctime*, and *st_mtime* fields of the file and
12580 the *st_ctime* and *st_mtime* fields of the parent directory.

12581 If *mode* is *w* or *w+* and the file did previously exist, upon successful completion, *fopen*( ) shall
12582 mark for update the *st_ctime* and *st_mtime* fields of the file. The *fopen*( ) function shall allocate a
12583 file descriptor as *open*( ) does.

12584 XSI After a successful call to the *fopen*( ) function, the orientation of the stream shall be cleared, the
12585 encoding rule shall be cleared, and the associated **mbstate_t** object shall be set to describe an
12586 initial conversion state.

The largest value that can be represented correctly in an object of type **off_t** shall be established as the offset maximum in the open file description.

RETURN VALUE

Upon successful completion, *fopen*( ) shall return a pointer to the object controlling the stream. Otherwise, a null pointer shall be returned, and *errno* shall be set to indicate the error.

ERRORS

The *fopen*( ) function shall fail if:

[EACCES] Search permission is denied on a component of the path prefix, or the file exists and the permissions specified by *mode* are denied, or the file does not exist and write permission is denied for the parent directory of the file to be created.

[EINTR] A signal was caught during *fopen*( ).

[EISDIR] The named file is a directory and *mode* requires write access.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

[ENAMETOOLONG]
The length of the *filename* argument exceeds {PATH_MAX} or a path name component is longer than {NAME_MAX}.

[ENFILE] The maximum allowable number of files is currently open in the system.

[ENOENT] A component of *filename* does not name an existing file or *filename* is an empty string.

[ENOSPC] The directory or file system that would contain the new file cannot be expanded, the file does not exist, and it was to be created.

[ENOTDIR] A component of the path prefix is not a directory.

[ENXIO] The named file is a character special or block special file, and the device associated with this special file does not exist.

[EOVERFLOW] The named file is a regular file and the size of the file cannot be represented correctly in an object of type **off_t**.

[EROFS] The named file resides on a read-only file system and *mode* requires write access.

The *fopen*( ) function may fail if:

[EINVAL] The value of the *mode* argument is not valid.

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[EMFILE] {FOPEN_MAX} streams are currently open in the calling process.

[EMFILE] {STREAM_MAX} streams are currently open in the calling process.

[ENAMETOOLONG]
Path name resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}.

12627 CX [ENOMEM] Insufficient storage space is available.

12628 CX [ETXTBSY] The file is a pure procedure (shared text) file that is being executed and *mode*
12629 requires write access.

12630 **EXAMPLES**

12631 **Opening a File**

12632 The following example tries to open the file named **file** for reading. The *fopen*( ) function returns
12633 a file pointer that is used in subsequent *fgets*( ) and *fclose*( ) calls. If the program cannot open the
12634 file, it just ignores it.

```
12635 #include <stdio.h>
12636 ...
12637 FILE *fp;
12638 ...
12639 void rgrep(const char *file)
12640 {
12641 ...
12642     if ((fp = fopen(file, "r")) == NULL)
12643         return;
12644 ...
12645 }
```

12646 **APPLICATION USAGE**

12647 None.

12648 **RATIONALE**

12649 None.

12650 **FUTURE DIRECTIONS**

12651 None.

12654 **CHANGE HISTORY**

12655 First released in Issue 1. Derived from Issue 1 of the SVID.

12656 **Issue 4**

12657 In the DESCRIPTION, the descriptions of input and output operations on update streams are
12658 changed to be requirements on the application.

12659 The [EMFILE] error is added to the ERRORS section, and all the optional errors are marked as
12660 extensions.

12661 The following changes are incorporated for alignment with the ISO C standard:

12662 - The type of arguments *filename* and *mode* are changed from **char*** to **const char***.

12663 - In the DESCRIPTION, the use and settings of the *mode* argument are changed to support
12664 binary streams, and *setpos*( ) is added to the list of file positioning functions.

12665 The following change is incorporated for alignment with the FIPS requirements:

12666 - In the ERRORS section, the condition whereby [ENAMETOOLONG] is returned if a path
12667 name component is larger that {NAME_MAX} is now defined as mandatory and marked as
12668 an extension.

Issue 4, Version 2

The ERRORS section is updated for X/OPEN UNIX conformance as follows:

- It states that [ELOOP] is returned if too many symbolic links are encountered during path name resolution.
- A second [ENAMETOOLONG] condition is defined that may report excessive length of an intermediate result of path name resolution of a symbolic link.

Issue 5

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are now marked.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The [ENAMETOOLONG] error is restored as an error dependent on _POSIX_NO_TRUNC. This is since behavior may vary from one file system to another.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file description. This change is to support large files.
- In the ERRORS section, the [EOVERFLOW] condition is added. This change is to support large files.
- The [ELOOP] mandatory error condition is added.
- The [EINVAL], [EMFILE], [ENAMETOOLONG], [ENOMEM], and [ETXTBSY] optional error conditions are added.

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The prototype for *fopen*( ) is updated.
- The DESCRIPTION is updated to note that if the argument *mode* points to a string other than those listed, then the behavior is undefined.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

12698 **NAME**

12699 fork — create a new process

12700 **SYNOPSIS**

12701
```
#include <unistd.h>
```

12702
```
pid_t fork(void);
```

12703 **DESCRIPTION**

12704 The *fork*( ) function creates a new process. The new process (child process) shall be an exact copy
12705 of the calling process (parent process) except as detailed below:

12706 • The child process has a unique process ID.

12707 • The child process ID also does not match any active process group ID.

12708 • The child process has a different parent process ID (that is, the process ID of the parent
12709 process).

12710 • The child process has its own copy of the parent's file descriptors. Each of the child's file
12711 descriptors refers to the same open file description with the corresponding file descriptor of
12712 the parent.

12713 • The child process has its own copy of the parent's open directory streams. Each open
12714 directory stream in the child process may share directory stream positioning with the
12715 corresponding directory stream of the parent.

12716 XSI • The child process may have its own copy of the parent's message catalog descriptors.

12717 • The child process' values of *tms_utime*, *tms_stime*, *tms_cutime*, and *tms_cstime* are set to 0.

12718 • The time left until an alarm clock signal is reset to zero, and the alarm, if any, is canceled; see
12719 *alarm*( ).

12720 XSI • All *semadj* values are cleared.

12721 • File locks set by the parent process are not inherited by the child process.

12722 • The set of signals pending for the child process is initialized to the empty set.

12723 XSI • Interval timers are reset in the child process.

12724 SEM • Any semaphores that are open in the parent process shall also be open in the child process.

12725 ML • The child process does not inherit any address space memory locks established by the parent
12726 process via calls to *mlockall*( ) or *mlock*( ).

12727 MF|SHM • Memory mappings created in the parent are retained in the child process. MAP_PRIVATE
12728 mappings inherited from the parent shall also be MAP_PRIVATE mappings in the child, and
12729 any modifications to the data in these mappings made by the parent prior to calling *fork*( )
12730 shall be visible to the child. Any modifications to the data in MAP_PRIVATE mappings made
12731 by the parent after *fork*( ) returns shall be visible only to the parent. Modifications to the data
12732 in MAP_PRIVATE mappings made by the child shall be visible only to the child.

12733 PS • For the SCHED_FIFO and SCHED_RR scheduling policies, the child process shall inherit the
12734 policy and priority settings of the parent process during a *fork*( ) function. For other
12735 scheduling policies, the policy and priority settings on *fork*( ) are implementation-defined.

12736 TMR • Per-process timers created by the parent are not inherited by the child process.

12737 MSG • The child process has its own copy of the message queue descriptors of the parent. Each of
12738 the message descriptors of the child refers to the same open message queue description as
12739 the corresponding message descriptor of the parent.

12740 AIO
- No asynchronous input or asynchronous output operations are inherited by the child process.

12742
- A process is created with a single thread. If a multi-threaded process calls *fork*( ), the new process contains a replica of the calling thread and its entire address space, possibly including the states of mutexes and other resources. Consequently, to avoid errors, the child process may only execute async-signal-safe operations until such time as one of the *exec* functions is called. Fork handlers may be established by means of the *pthread_atfork*( ) function in order to maintain application invariants across *fork*( ) calls.

12748 TRC TRI
- If the Trace option and the Trace Inherit option are both supported:

  If the calling process was being traced in a trace stream that had its inheritance policy set to POSIX_TRACE_INHERITED, the child process shall be traced into that trace stream, and the child process shall inherit the parent's mapping of trace event names to trace event type identifiers. If the trace stream in which the calling process was being traced had its inheritance policy set to POSIX_TRACE_CLOSE_FOR_CHILD, the child process shall not be traced into that trace stream. The inheritance policy is set by a call to the *posix_trace_attr_setinherited*( ) function.

12756 TRC
- If the Trace option is supported, but the Trace Inherit option is not supported:

  The child process shall not be traced into any of the trace streams of its parent process.

12758
- If the Trace option is supported, the child process of a trace controller process shall not control the trace streams controlled by its parent process.

12760 CPT The initial value of the CPU-time clock of the child process shall be set to zero.

12761 TCT The initial value of the CPU-time clock of the single thread of the child process shall be set to zero.

12763 ***Notes to Reviewers***

12764 *This section with side shading will not appear in the final copy. - Ed.*

12765 Check this text is correct after new addenda are rolled in. (Ref D1, XSH, ERN 126)

12766 For process characteristics not defined by this volume of IEEE Std. 1003.1-200x, their inheritance
12767 is not defined by this volume of IEEE Std. 1003.1-200x. Process characteristics defined by this
12768 volume of IEEE Std. 1003.1-200x have their inheritance explicitly defined.

12769 After *fork*( ), both the parent and the child processes are capable of executing independently
12770 before either one terminates.

12771 **RETURN VALUE**

12772 Upon successful completion, *fork*( ) shall return 0 to the child process and shall return the
12773 process ID of the child process to the parent process. Both processes shall continue to execute
12774 from the *fork*( ) function. Otherwise, –1 shall be returned to the parent process, no child process
12775 shall be created, and *errno* shall be set to indicate the error.

12776 **ERRORS**

12777 The *fork*( ) function shall fail if:

12778 [EAGAIN] The system lacked the necessary resources to create another process, or the
12779 system-imposed limit on the total number of processes under execution
12780 system-wide or by a single user {CHILD_MAX} would be exceeded.

12781 The *fork*( ) function may fail if:

12782 [ENOMEM] Insufficient storage space is available. |

12783 **EXAMPLES**

12784 None.

12785 **APPLICATION USAGE**

12786 None.

12787 **RATIONALE**

12788 Many historical implementations have timing windows where a signal sent to a process group
12789 (for example, an interactive SIGINT) just prior to or during execution of *fork*( ) is delivered to the
12790 parent following the *fork*( ) but not to the child because the *fork*( ) code clears the child's set of
12791 pending signals. This volume of IEEE Std. 1003.1-200x does not require, or even permit, this
12792 behavior. However, it is pragmatic to expect that problems of this nature may continue to exist
12793 in implementations that appear to conform to this volume of IEEE Std. 1003.1-200x and pass
12794 available verification suites. This behavior is only a consequence of the implementation failing to
12795 make the interval between signal generation and delivery totally invisible. From the
12796 application's perspective, a *fork*( ) call should appear atomic. A signal that is generated prior to
12797 the *fork*( ) should be delivered prior to the *fork*( ). A signal sent to the process group after the
12798 *fork*( ) should be delivered to both parent and child. The implementation may actually initialize
12799 internal data structures corresponding to the child's set of pending signals to include signals
12800 sent to the process group during the *fork*( ). Since the *fork*( ) call can be considered as atomic
12801 from the application's perspective, the set would be initialized as empty and such signals would
12802 have arrived after the *fork*( ); see also **<signal.h>**.

12803 One approach that has been suggested to address the problem of signal inheritance across *fork*( )
12804 is to add an [EINTR] error, which would be returned when a signal is detected during the call. |
12805 While this is preferable to losing signals, it was not considered an optimal solution. Although it
12806 is not recommended for this purpose, such an error would be an allowable extension for an
12807 implementation.

12808 The [ENOMEM] error value is reserved for those implementations that detect and distinguish |
12809 such a condition. This condition occurs when an implementation detects that there is not enough
12810 memory to create the process. This is intended to be returned when [EAGAIN] is inappropriate |
12811 because there can never be enough memory (either primary or secondary storage) to perform the
12812 operation. Because *fork*( ) duplicates an existing process, this must be a condition where there is
12813 sufficient memory for one such process, but not for two. Many historical implementations
12814 actually return [ENOMEM] due to temporary lack of memory, a case that is not generally |
12815 distinct from [EAGAIN] from the perspective of a portable application.

12816 Part of the reason for including the optional error [ENOMEM] is because the SVID specifies it
12817 and it should be reserved for the error condition specified there. The condition is not applicable
12818 on many implementations.

12819 IEEE Std. 1003.1-1988 neglected to require concurrent execution of the parent and child of *fork*( ). |
12820 A system that single-threads processes was clearly not intended and is considered an
12821 unacceptable ''toy implementation'' of this volume of IEEE Std. 1003.1-200x. The only objection
12822 anticipated to the phrase ''executing independently'' is testability, but this assertion should be
12823 testable. Such tests require that both the parent and child can block on a detectable action of the
12824 other, such as a write to a pipe or a signal. An interactive exchange of such actions should be
12825 possible for the system to conform to the intent of this volume of IEEE Std. 1003.1-200x.

12826 The [EAGAIN] error exists to warn applications that such a condition might occur. Whether it
12827 occurs or not is not in any practical sense under the control of the application because the
12828 condition is usually a consequence of the user's use of the system, not of the application's code.
12829 Thus, no application can or should rely upon its occurrence under any circumstances, nor

should the exact semantics of what concept of ''user'' is used be of concern to the application writer. Validation writers should be cognizant of this limitation.

There are two reasons why POSIX programmers call *fork*(). One reason is to create a new thread of control within the same program (which was originally only possible in POSIX by creating a new process); the other is to create a new process running a different program. In the latter case, the call to *fork*() is soon followed by a call to one of the *exec* functions.

The general problem with making *fork*() work in a multi-threaded world is what to do with all of the threads. There are two alternatives. One is to copy all of the threads into the new process. This causes the programmer or implementation to deal with threads that are suspended on system calls or that might be about to execute system calls that should not be executed in the new process. The other alternative is to copy only the thread that calls *fork*(). This creates the difficulty that the state of process-local resources is usually held in process memory. If a thread that is not calling *fork*() holds a resource, that resource is never released in the child process because the thread whose job it is to release the resource does not exist in the child process.

When a programmer is writing a multi-threaded program, the first described use of *fork*(), creating new threads in the same program, is provided by the *pthread_create*() function. The *fork*() function is thus used only to run new programs, and the effects of calling functions that require certain resources between the call to *fork*() and the call to an *exec* function are undefined.

The addition of the *forkall*() function to the standard was considered and rejected. The *forkall*() function lets all the threads in the parent be duplicated in the child. This essentially duplicates the state of the parent in the child. This allows threads in the child to continue processing and allows locks and the state to be preserved without explicit *pthread_atfork*() code. The calling process has to ensure that the threads processing state that is shared between the parent and child (that is, file descriptors or MAP_SHARED memory) behaves properly after *forkall*(). For example, if a thread is reading a file descriptor in the parent when *forkall*() is called, then two threads (one in the parent and one in the child) are reading the file descriptor after the *forkall*(). If this is not desired behavior, the parent process has to synchronize with such threads before calling *forkall*().

When *forkall*() is called, threads, other than the calling thread, that are in POSIX System Interfaces functions that can return with an [EINTR] error may have those functions return [EINTR] if the implementation cannot ensure that the function behaves correctly in the parent and child. In particular, *pthread_cond_wait*() and *pthread_cond_timedwait*() need to return in order to ensure that the condition has not changed. These functions can be awakened by a spurious condition wakeup rather than returning [EINTR].

FUTURE DIRECTIONS

None.

SEE ALSO

alarm(), *exec*, *fcntl*(), *posix_trace_attr_getinherited*(), *posix_trace_trid_eventid_open*(), *semop*(), *signal*(), *times*(), the Base Definitions volume of IEEE Std. 1003.1-200x, **<sys/types.h>**, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The **<sys/types.h>** header is now marked as optional (OH); this header need not be included on XSI-conformant systems.

The following changes are incorporated for alignment with the ISO POSIX-1 standard:

- The argument list is explicitly defined as **void**.
- Though functionally identical to Issue 3, the DESCRIPTION has been reorganized to improve clarity and to align more closely with the ISO POSIX-1 standard.
- The description of the [EAGAIN] error is updated to indicate that this error can also be returned if a system lacks the resources to create another process.

Issue 4, Version 2

The DESCRIPTION is changed for X/OPEN UNIX conformance to identify that interval timers are reset in the child process.

Issue 5

The DESCRIPTION is changed for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The effect of *fork*( ) on a pending alarm call in the child process is clarified.

The description of CPU-time clock semantics is added for alignment with IEEE Std. 1003.1d-1999.

The description of tracing semantics is added for alignment with IEEE Std. 1003.1q-2000.

12898 **NAME**

12899 fpathconf, pathconf — get configurable path name variables

12900 **SYNOPSIS**

12901 `#include <unistd.h>`

12902 `long fpathconf(int fildes, int name);`

12903 `long pathconf(const char *path, int name);`

12904 **DESCRIPTION**

12905 The *fpathconf*( ) and *pathconf*( ) functions provide a method for the application to determine the
12906 current value of a configurable limit or option (*variable*) that is associated with a file or directory.

12907 For *pathconf*( ), the *path* argument points to the path name of a file or directory.

12908 For *fpathconf*( ), the *fildes* argument is an open file descriptor.

12909 The *name* argument represents the variable to be queried relative to that file or directory.
12910 Implementations shall support all of the variables listed in the following table and may support
12911 others. The variables in the following table come from **<limits.h>** or **<unistd.h>** and the
12912 symbolic constants, defined in **<unistd.h>**, are the corresponding values used for *name*. Support
12913 for some path name configuration variables is dependent on implementation options (see
12914 shading and margin codes in the table below). Where an implementation option is not
12915 supported, the variable need not be supported.

12916

12917

	Variable	Value of *name*	Notes
12918	{FILESIZEBITS}	_PC_FILESIZEBITS	3, 4
12919	{LINK_MAX}	_PC_LINK_MAX	1
12920	{MAX_CANON}	_PC_MAX_CANON	2
12921	{MAX_INPUT}	_PC_MAX_INPUT	2
12922	{NAME_MAX}	_PC_NAME_MAX	3, 4
12923	{PATH_MAX}	_PC_PATH_MAX	4, 5
12924	{PIPE_BUF}	_PC_PIPE_BUF	6
12925 ADV	{POSIX_ALLOC_SIZE_MIN}	_PC_ALLOC_SIZE_MIN	
12926 ADV	{POSIX_REC_INCR_XFER_SIZE}	_PC_REC_INCR_XFER_SIZE	
12927 ADV	{POSIX_REC_MAX_XFER_SIZE}	_PC_REC_MAX_XFER_SIZE	
12928 ADV	{POSIX_REC_MIN_XFER_SIZE}	_PC_REC_MIN_XFER_SIZE	
12929 ADV	{POSIX_REC_XFER_ALIGN}	_PC_REC_XFER_ALIGN	
12930	{SYMLINK_MAX}	_PC_SYMLINK_MAX	4,9
12931	_POSIX_CHOWN_RESTRICTED	_PC_CHOWN_RESTRICTED	7
12932	_POSIX_NO_TRUNC	_PC_NO_TRUNC	3, 4
12933	_POSIX_VDISABLE	_PC_VDISABLE	2

12935	_POSIX_PRIO_IO	_PC_PRIO_IO	8
12936	_POSIX_SYNC_IO	_PC_SYNC_IO	8

12937 **Notes:**

12938 1. If *path* or *fildes* refers to a directory, the value returned applies to the directory
12939 itself.

12940 2. If *path* or *fildes* does not refer to a terminal file, it is unspecified whether an
12941 implementation supports an association of the variable name with the specified
12942 file.

3. If *path* or *fildes* refers to a directory, the value returned applies to file names within the directory.
4. If *path* or *fildes* does not refer to a directory, it is unspecified whether an implementation supports an association of the variable name with the specified file.
5. If *path* or *fildes* refers to a directory, the value returned is the maximum length of a relative path name when the specified directory is the working directory.
6. If *path* refers to a FIFO, or *fildes* refers to a pipe or FIFO, the value returned applies to the referenced object. If *path* or *fildes* refers to a directory, the value returned applies to any FIFO that exists or can be created within the directory. If *path* or *fildes* refers to any other type of file, it is unspecified whether an implementation supports an association of the variable name with the specified file.
7. If *path* or *fildes* refers to a directory, the value returned applies to any files, other than directories, that exist or can be created within the directory.
8. If *path* or *fildes* refers to a directory, it is unspecified whether an implementation supports an association of the variable name with the specified file.
9. If *path* or *fildes* refers to a directory, the value returned is the maximum length of the string that a symbolic link in that directory can contain.

RETURN VALUE

If *name* is an invalid value, both *pathconf*( ) and *fpathconf*( ) shall return –1 and set *errno* to indicate the error.

If the variable corresponding to *name* has no limit for the *path* or file descriptor, both *pathconf*( ) and *fpathconf*( ) shall return –1 without changing *errno*. If the implementation needs to use *path* to determine the value of *name* and the implementation does not support the association of *name* with the file specified by *path*, or if the process did not have appropriate privileges to query the file specified by *path*, or *path* does not exist, *pathconf*( ) shall return –1 and set *errno* to indicate the error.

If the implementation needs to use *fildes* to determine the value of *name* and the implementation does not support the association of *name* with the file specified by *fildes*, or if *fildes* is an invalid file descriptor, *fpathconf*( ) shall return –1 and set *errno* to indicate the error.

Otherwise, *pathconf*( ) or *fpathconf*( ) shall return the current variable value for the file or directory without changing *errno*. The value returned shall not be more restrictive than the corresponding value available to the application when it was compiled with the implementation's **<limits.h>** or **<unistd.h>**.

ERRORS

The *pathconf*( ) function shall fail if:

[EINVAL] The value of *name* is not valid.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

The *pathconf*( ) function may fail if:

[EACCES] Search permission is denied for a component of the path prefix.

[EINVAL] The implementation does not support an association of the variable *name* with the specified file.

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG] |
The length of the *path* argument exceeds {PATH_MAX} or a path name component is longer than {NAME_MAX}. |

[ENAMETOOLONG] |
As a result of encounering a symbolic link in resolution of the *path* argument, the length of the substituted path name string exceeded {PATH_MAX}. |

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string. |

[ENOTDIR] A component of the path prefix is not a directory. |

The *fpathconf*( ) function shall fail if:

[EINVAL] The value of *name* is not valid. |

The *fpathconf*( ) function may fail if:

[EBADF] The *fildes* argument is not a valid file descriptor. |

[EINVAL] The implementation does not support an association of the variable *name* with the specified file. |

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The *pathconf*( ) function was proposed immediately after the *sysconf*( ) function when it was realized that some configurable values may differ across file system, directory, or device boundaries.

For example, {NAME_MAX} frequently changes between System V and BSD-based file systems; System V uses a maximum of 14, BSD 255. On an implementation that provides both types of file systems, an application would be forced to limit all path name components to 14 bytes, as this would be the value specified in **<limits.h>** on such a system.

Therefore, various useful values can be queried on any path name or file descriptor, assuming that the appropriate permissions are in place.

The value returned for the variable {PATH_MAX} indicates the longest relative path name that could be given if the specified directory is the process' current working directory. A process may not always be able to generate a name that long and use it if a subdirectory in the path name crosses into a more restrictive file system.

The value returned for the variable _POSIX_CHOWN_RESTRICTED also applies to directories that do not have file systems mounted on them. The value may change when crossing a mount point, so applications that need to know should check for each directory. (An even easier check is to try the *chown*( ) function and look for an error in case it happens.)

Unlike the values returned by *sysconf*( ), the path name-oriented variables are potentially more volatile and are not guaranteed to remain constant throughout the process' lifetime. For example, in between two calls to *pathconf*( ), the file system in question may have been unmounted and remounted with different characteristics.

Also note that most of the errors are optional. If one of the variables always has the same value on an implementation, the implementation need not look at *path* or *fildes* to return that value and is, therefore, not required to detect any of the errors except the meaning of [EINVAL] that indicates that the value of *name* is not valid for that variable.

If the value of any of the limits are indeterminate (logically infinite), they are defined in **<limits.h>** and the *pathconf*( ) and *fpathconf*( ) functions return –1 without changing *errno*. This can be distinguished from the case of giving an unrecognized *name* argument because *errno* is set to [EINVAL] in this case.

Since –1 is a valid return value for the *pathconf*( ) and *fpathconf*( ) functions, applications should set *errno* to zero before calling them and check *errno* only if the return value is –1.

For the case of {SYMLINK_MAX}, since both *pathconf*( ) and *open*( ) follow symbolic links, there is no way that *path* or *fildes* could refer to a symbolic link.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3.

Entry included for alignment with the POSIX.1-1988 standard.

Issue 4

The *fpathconf*( ) function now has the full **long** return type in the SYNOPSIS section.

The following changes gave been made for alignment with the ISO POSIX-1 standard:

- The type of argument *path* is changed from **char*** to **const char***. Also, the return value of both functions is changed from **long** to **long**.
- In the DESCRIPTION, the words ‘‘The behavior is undefined if’’ have been replaced by ‘‘it is unspecified whether an implementation supports an association of the variable name with the specified file’’ in notes 2, 4, and 6.
- In the RETURN VALUE section, errors associated with the use of *path* and *fildes*, when an implementation does not support the requested association, are now specified separately.
- The requirement that *errno* be set to indicate the error is added.

The following change is incorporated for alignment with the FIPS requirements:

- In the ERRORS section, the condition whereby [ENAMETOOLONG] is returned if a path name component is larger that {NAME_MAX} is now defined as mandatory and marked as an extension.

Issue 4, Version 2

The ERRORS section is updated for X/OPEN UNIX conformance as follows:

- It states that [ELOOP] is returned if too many symbolic links are encountered during path name resolution.
- A second [ENAMETOOLONG] condition is defined that may report excessive length of an intermediate result of path name resolution of a symbolic link.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

Large File Summit extensions are added.

Issue 6

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The [ENAMETOOLONG] error is restored as an error dependent on _POSIX_NO_TRUNC. This is since behavior may vary from one file system to another.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to include {FILESIZEBITS}.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The _PC_SYMLINK_MAX entry is added to the table in the DESCRIPTION.

The *pathconf*( ) variables {POSIX_ALLOC_SIZE_MIN}, {POSIX_REC_INCR_XFER_SIZE}, {POSIX_REC_MAX_XFER_SIZE}, {POSIX_REC_MIN_XFER_SIZE}, {POSIX_REC_XFER_ALIGN} and their associated names are added for alignment with IEEE Std. 1003.1d-1999.

13088 **NAME**

13089 fpclassify — classify real floating type

13090 **SYNOPSIS**

13091 `#include <math.h>`

13092 `int fpclassify(real-floating x);`

13093 **DESCRIPTION**

13094 CX The functionality described on this reference page is aligned with the ISO C standard. Any
13095 conflict between the requirements described here and the ISO C standard is unintentional. This
13096 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

13097 The *fpclassify*( ) macro shall classify its argument value as NaN, infinite, normal, subnormal,
13098 zero, or into another implementation-defined category. First, an argument represented in a
13099 format wider than its semantic type is converted to its semantic type. Then classification is based
13100 on the type of the argument.

13101 **RETURN VALUE**

13102 The *fpclassify*( ) macro shall return the value of the number classification macro appropriate to
13103 the value of its argument.

13104 **ERRORS**

13105 No errors are defined.

13106 **EXAMPLES**

13107 None.

13108 **APPLICATION USAGE**

13109 None.

13110 **RATIONALE**

13111 None.

13112 **FUTURE DIRECTIONS**

13113 None.

13114 **SEE ALSO**

13115 *isfinite*( ), *isinf*( ), *isnan*( ), *isnormal*( ), *signbit*( ), the Base Definitions volume of
13116 IEEE Std. 1003.1-200x, **<math.h>**

13117 **CHANGE HISTORY**

13118 First released in Issue 6. Derived from the ISO / IEC 9899: 1999 standard.

13119 **NAME**

13120 fprintf, printf, snprintf, sprintf — print formatted output

13121 **SYNOPSIS**

13122 `#include <stdio.h>`

13123 `int fprintf(FILE *restrict stream, const char *restrict format, ...);`
13124 `int printf(const char *restrict format, ...);`
13125 `int snprintf(char *restrict s, size_t n, const char *restrict format, ...);`
13126 `int sprintf(char *restrict s, const char *restrict format, ...);`

13127 **DESCRIPTION**

13128 CX The functionality described on this reference page is aligned with the ISO C standard. Any
13129 conflict between the requirements described here and the ISO C standard is unintentional. This
13130 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

13131 The *fprintf*( ) function places output on the named output *stream*. The *printf*( ) function places
13132 output on the standard output stream *stdout*. The *sprintf*( ) function places output followed by
13133 the null byte, `'\0'`, in consecutive bytes starting at **s*; it is the user's responsibility to ensure that
13134 enough space is available.

13135 XSI The *snprintf*( ) function is identical to *sprintf*( ) with the addition of the *n* argument, which states
13136 the size of the buffer referred to by *s*. If *n* is greater than zero, but not large enough to hold all
13137 output bytes specified by the format, output bytes beyond the *n*-1st are discarded rather than
13138 being written into the array.

13139 If copying takes place between objects that overlap as a result of a call to *sprintf*( ) or *snprintf*( ),
13140 the results are undefined.

13141 Each of these functions converts, formats, and prints its arguments under control of the *format*.
13142 The *format* is a character string, beginning and ending in its initial shift state, if any. The *format* is
13143 composed of zero or more directives: *ordinary characters*, which are simply copied to the output
13144 stream, and *conversion specifications*, each of which results in the fetching of zero or more
13145 arguments. The results are undefined if there are insufficient arguments for the *format*. If the
13146 *format* is exhausted while arguments remain, the excess arguments are evaluated but are
13147 otherwise ignored.

13148 XSI Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than
13149 to the next unused argument. In this case, the conversion character `'%'` (see below) is replaced
13150 by the sequence `"%n$"`, where *n* is a decimal integer in the range [1,{NL_ARGMAX}], giving the
13151 position of the argument in the argument list. This feature provides for the definition of format
13152 strings that select arguments in an order appropriate to specific languages (see the EXAMPLES
13153 section).

13154 In format strings containing the `"%n$"` form of conversion specifications, numbered arguments
13155 in the argument list can be referenced from the format string as many times as required.

13156 In format strings containing the `'%'` form of conversion specifications, each argument in the
13157 argument list is used exactly once.

13158 All forms of the *fprintf*( ) functions allow for the insertion of a language-dependent radix
13159 character in the output string. The radix character is defined in the program's locale (category
13160 *LC_NUMERIC*). In the POSIX locale, or in a locale where the radix character is not defined, the
13161 radix character defaults to a period (`'.'`).

13162 XSI Each conversion specification is introduced by the `'%'` character or by the character sequence
13163 `"%n$"`, after which the following appear in sequence:

- Zero or more *flags* (in any order), which modify the meaning of the conversion specification.
- An optional minimum *field width*. If the converted value has fewer bytes than the field width, it shall be padded with spaces by default on the left; it shall be padded on the right, if the left-adjustment flag ('−'), described below, is given to the field width. The field width takes the form of an asterisk ('*'), described below, or a decimal integer.
- An optional *precision* that gives the minimum number of digits to appear for the *d*, *i*, *o*, *u*, *x*, and *X* conversions; the number of digits to appear after the radix character for the *e*, *E*, and *f* conversions; the maximum number of significant digits for the *g* and *G* conversions; or the maximum number of bytes to be printed from a string in *s* and *S* conversions. The precision takes the form of a period ('.') followed either by an asterisk ('*'), described below, or an optional decimal digit string, where a null digit string is treated as 0. If a precision appears with any other conversion character, the behavior is undefined.
- An optional length modifier that specifies the size of the argument.
- A *conversion character* that indicates the type of conversion to be applied.

A field width, or precision, or both, may be indicated by an asterisk ('*'). In this case an argument of type **int** supplies the field width or precision. Applications shall ensure that arguments specifying field width, or precision, or both appear in that order before the argument, if any, to be converted. A negative field width is taken as a '−' flag followed by a positive field width. A negative precision is taken as if the precision were omitted. In format strings containing the "%n$" form of a conversion specification, a field width or precision may be indicated by the sequence "*m$", where *m* is a decimal integer in the range [1,{NL_ARGMAX}] giving the position in the argument list (after the format argument) of an integer argument containing the field width or precision, for example:

```
printf("%1$d:%2$.*3$d:%4$.*3$d\n", hour, min, precision, sec);
```

The *format* can contain either numbered argument specifications (that is, "%n$" and "*m$"), or unnumbered argument specifications (that is, '%' and '*'), but normally not both. The only exception to this is that "%%" can be mixed with the "%n$" form. The results of mixing numbered and unnumbered argument specifications in a *format* string are undefined. When numbered argument specifications are used, specifying the *N*th argument requires that all the leading arguments, from the first to the (*N*–*1*)th, are specified in the format string.

The flag characters and their meanings are:

' The integer portion of the result of a decimal conversion (%*i*, %*d*, %*u*, %*f*, %*g*, or %*G*) shall be formatted with thousands' grouping characters. For other conversions the behavior is undefined. The non-monetary grouping character is used.

– The result of the conversion shall be left-justified within the field. The conversion is right-justified if this flag is not specified.

+ The result of a signed conversion shall always begin with a sign ('+' or '−'). The conversion shall begin with a sign only when a negative value is converted if this flag is not specified.

<space> If the first character of a signed conversion is not a sign or if a signed conversion results in no characters, a space shall be prefixed to the result. This means that if the space and '+' flags both appear, the space flag shall be ignored.

This flag specifies that the value is to be converted to an alternative form. For *o* conversion, it increases the precision (if necessary) to force the first digit of the result to be 0. For *x* or *X* conversions, a non-zero result shall have 0x (or 0X) prefixed to it. For *e*, *E*, *f*, *g*, or *G* conversions, the result shall always contain a radix character, even if no

13210 digits follow the radix character. Without this flag, a radix character appears in the
13211 result of these conversions only if a digit follows it. For *g* and *G* conversions, trailing
13212 zeros shall *not* be removed from the result as they normally are. For other conversions,
13213 the behavior is undefined.

13214 0 For *d*, *i*, *o*, *u*, *x*, *X*, *e*, *E*, *f*, *g*, and *G* conversions, leading zeros (following any indication of
13215 sign or base) are used to pad to the field width; no space padding is performed. If the |
13216 `'0'` and `'−'` flags both appear, the `'0'` flag is ignored. For *d*, *i*, *o*, *u*, *x*, and *X* |
13217 XSI conversions, if a precision is specified, the `'0'` flag is ignored. If the `'0'` and `'\''` |
13218 flags both appear, the grouping characters are inserted before zero padding. For other
13219 conversions, the behavior is undefined. |

13220 The length modifiers and their meanings are: |

13221 *hh* Specifies that a following *d*, *i*, *o*, *u*, *x*, or *X* conversion specifier applies to a **signed char** |
13222 or **unsigned char** argument (the argument will have been promoted according to the |
13223 integer promotions, but its value shall be converted to **signed char** or **unsigned char** |
13224 before printing); or that a following *n* conversion specifier applies to a pointer to a |
13225 **signed char** argument. |

13226 *h* Specifies that a following *d*, *i*, *o*, *u*, *x*, or *X* conversion specifier applies to a **short** or |
13227 **unsigned short** argument (the argument will have been promoted according to the |
13228 integer promotions, but its value shall be converted to **short** or **unsigned short** before |
13229 printing); or that a following *n* conversion specifier applies to a pointer to a **short** |
13230 argument. |

13231 *l* (ell) Specifies that a following *d*, *i*, *o*, *u*, *x*, or *X* conversion specifier applies to a **long** or |
13232 **unsigned long** argument; that a following *n* conversion specifier applies to a pointer to |
13233 a **long** argument; that a following *c* conversion specifier applies to a **wint_t** argument; |
13234 that a following *s* conversion specifier applies to a pointer to a **wchar_t** argument; or |
13235 has no effect on a following *a*, *A*, *e*, *E*, *f*, *F*, *g*, or *G* conversion specifier. |

13236 *ll* (ell-ell) Specifies that a following *d*, *i*, *o*, *u*, *x*, or *X* conversion specifier applies to a **long long** or |
13237 **unsigned long long** argument; or that a following *n* conversion specifier applies to a |
13238 pointer to a **long long** argument. |

13239 *j* Specifies that a following *d*, *i*, *o*, *u*, *x*, or *X* conversion specifier applies to an **intmax_t** or |
13240 **uintmax_t** argument; or that a following *n* conversion specifier applies to a pointer to |
13241 an **intmax_t** argument. |

13242 *z* Specifies that a following *d*, *i*, *o*, *u*, *x*, or *X* conversion specifier applies to a **size_t** or the |
13243 corresponding signed integer type argument; or that a following *n* conversion specifier |
13244 applies to a pointer to a signed integer type corresponding to **size_t** argument. |

13245 *t* Specifies that a following *d*, *i*, *o*, *u*, *x*, or *X* conversion specifier applies to a **ptrdiff_t** or |
13246 the corresponding **unsigned** type argument; or that a following n conversion specifier |
13247 applies to a pointer to a **ptrdiff_t** argument. |

13248 *L* Specifies that a following *a*, *A*, *e*, *E*, *f*, *F*, *g*, or*G* conversion specifier applies to a **long** |
13249 **double** argument. |

13250 If a length modifier appears with any conversion specifier other than as specified above, the |
13251 behavior is undefined. |

13252 The conversion characters and their meanings are: |

13253 *d*, *i* The **int** argument is converted to a signed decimal in the style **[**−**]***dddd*. The precision
13254 specifies the minimum number of digits to appear; if the value being converted can be
13255 represented in fewer digits, it shall be expanded with leading zeros. The default

13256 precision is 1. The result of converting 0 with an explicit precision of 0 is no characters.

13257 *o* The **unsigned** argument is converted to unsigned octal format in the style *dddd*. The
13258 precision specifies the minimum number of digits to appear; if the value being
13259 converted can be represented in fewer digits, it shall be expanded with leading zeros.
13260 The default precision is 1. The result of converting 0 with an explicit precision of 0 is no
13261 characters.

13262 *u* The **unsigned** argument is converted to unsigned decimal format in the style *dddd*. The
13263 precision specifies the minimum number of digits to appear; if the value being
13264 converted can be represented in fewer digits, it shall be expanded with leading zeros.
13265 The default precision is 1. The result of converting 0 with an explicit precision of 0 is no
13266 characters.

13267 *x* The **unsigned** argument is converted to unsigned hexadecimal format in the style *dddd*;
13268 the letters "abcdef" are used. The precision specifies the minimum number of digits
13269 to appear; if the value being converted can be represented in fewer digits, it shall be
13270 expanded with leading zeros. The default precision is 1. The result of converting 0 with
13271 an explicit precision of 0 is no characters.

13272 *X* Behaves the same as the *x* conversion character except that letters "ABCDEF" are used
13273 instead of "abcdef".

13274 *f, F* The **double** argument is converted to decimal notation in the style **[–]***ddd.ddd*, where
13275 the number of digits after the radix character is equal to the precision specification. If
13276 the precision is missing, it is taken as 6; if the precision is explicitly 0 and no '#' flag is
13277 present, no radix character appears. If a radix character appears, at least one digit
13278 appears before it. The value is rounded to the appropriate number of digits.

13279 A **double** argument representing an infinity is converted in one of the styles [–]inf or
13280 [–]infinity; which style is implementation-defined. A **double** argument representing a
13281 NaN is converted in one of the styles [–]nan or [–]nan(*n-char-sequence*); which style, and
13282 the meaning of any *n-char-sequence*, is implementation-defined. The *F* conversion
13283 specifier produces INF, INFINITY, or NAN instead of inf, infinity, or nan, respectively.

13284 *e, E* The **double** argument is converted in the style **[–]***d.ddde±dd*, where there is one digit
13285 before the radix character (which is non-zero if the argument is non-zero) and the
13286 number of digits after it is equal to the precision; if the precision is missing, it is taken
13287 as 6; if the precision is 0 and no '#' flag is present, no radix character appears. The
13288 value is rounded to the appropriate number of digits. The *E* conversion character will
13289 produce a number with *E* instead of *e* introducing the exponent. The exponent always
13290 contains at least two digits. If the value is 0, the exponent is 0.

13291 A **double** argument representing an infinity or NaN is converted in the style of an *f* or *F*
13292 conversion specifier.

13293 *g, G* The **double** argument is converted in the style *f* or *e* (or in the style *E* in the case of a *G*
13294 conversion character), with the precision specifying the number of significant digits. If
13295 an explicit precision is 0, it is taken as 1. The style used depends on the value
13296 converted; style *e* (or *E*) shall be used only if the exponent resulting from such a
13297 conversion is less than –4 or greater than or equal to the precision. Trailing zeros are
13298 removed from the fractional portion of the result; a radix character appears only if it is
13299 followed by a digit.

13300 A **double** argument representing an infinity or NaN is converted in the style of an *f* or *F*
13301 conversion specifier.

a, A A **double** argument representing a floating-point number is converted in the style [–]0xh.hhhh p1d, where there is one hexadecimal digit (which is non-zero if the argument is a normalized floating-point number and is otherwise unspecified) before the decimal-point character 235) and the number of hexadecimal digits after it is equal to the precision; if the precision is missing and FLT_RADIX is a power of 2, then the precision is sufficient for an exact representation of the value; if the precision is missing and FLT_RADIX is not a power of 2, then the precision is sufficient to distinguish 236) values of type **double**, except that trailing zeros may be omitted; if the precision is zero and the '#' flag is not specified, no decimal-point character appears. The letters "abcdef" are used for a conversion and the letters "ABCDEF" for *A* conversion. The *A* conversion specifier produces a number with 'X' and 'P' instead of 'x' and 'p'. The exponent always contains at least one digit, and only as many more digits as necessary to represent the decimal exponent of 2. If the value is zero, the exponent is zero.

A **double** argument representing an infinity or NaN is converted in the style of an *f* or *F* conversion specifier.

c The **int** argument is converted to an **unsigned char**, and the resulting byte is written.

If an *l* (ell) qualifier is present, the **wint_t** argument is converted as if by an *ls* conversion specification with no precision and an argument that points to a two-element array of type **wchar_t**, the first element of which contains the **wint_t** argument to the *ls* conversion specification and the second element contains a null wide character.

s The argument shall be a pointer to an array of **char**. Bytes from the array are written up to (but not including) any terminating null byte. If the precision is specified, no more than that many bytes shall be written. If the precision is not specified or is greater than the size of the array, the application shall ensure that the array contains a null byte.

If an *l* (ell) qualifier is present, the argument shall be a pointer to an array of type **wchar_t**. Wide characters from the array are converted to characters (each as if by a call to the *wcrtomb*( ) function, with the conversion state described by an **mbstate_t** object initialized to zero before the first wide character is converted) up to and including a terminating null wide character. The resulting characters shall be written up to (but not including) the terminating null character (byte). If no precision is specified, the application shall ensure that the array contains a null wide character. If a precision is specified, no more than that many characters (bytes) shall be written (including shift sequences, if any), and the array shall contain a null wide character if, to equal the character sequence length given by the precision, the function would need to access a wide character one past the end of the array. In no case is a partial character written.

p The argument shall be a pointer to **void**. The value of the pointer is converted to a sequence of printable characters, in an implementation-defined manner.

n The argument shall be a pointer to an integer into which is written the number of bytes written to the output so far by this call to one of the *fprintf*( ) functions. No argument is converted.

XSI *C* Same as *lc*.

XSI *S* Same as *ls*.

% Print a '%'; no argument is converted. The entire conversion specification shall be "%%".

If a conversion specification does not match one of the above forms, the behavior is undefined. If any argument is not the correct type for the corresponding conversion specification, the behavior is undefined.

In no case does a nonexistent or small field width cause truncation of a field; if the result of a conversion is wider than the field width, the field is simply expanded to contain the conversion result. Characters generated by *fprintf*( ) and *printf*( ) are printed as if *fputc*( ) had been called.

For *a* and *A* conversions, if FLT_RADIX is a power of 2, the value is correctly rounded to a hexadecimal floating number with the given precision.

If FLT_RADIX is not a power of 2, the result should be one of the two adjacent numbers in hexadecimal floating style with the given precision, with the extra stipulation that the error should have a correct sign for the current rounding direction.

For *e*, *E*, *f*, *F*, *g*, and *G* conversions, if the number of significant decimal digits is at most DECIMAL_DIG, then the result should be correctly rounded. If the number of significant decimal digits is more than DECIMAL_DIG but the source value is exactly representable with DECIMAL_DIG digits, then the result should be an exact representation with trailing zeros. Otherwise, the source value is bounded by two adjacent decimal strings `"L < U"`, both having DECIMAL_DIG significant digits; the value of the resultant decimal string `"D"` should satisfy `"L <= D <= U"`, with the extra stipulation that the error should have a correct sign for the current rounding direction.

CX The *st_ctime* and *st_mtime* fields of the file shall be marked for update between the call to a successful execution of *fprintf*( ) or *printf*( ) and the next successful completion of a call to *fflush*( ) or *fclose*( ) on the same stream or a call to *exit*( ) or *abort*( ).

RETURN VALUE

Upon successful completion, the *fprintf*( ) and *printf*( ) functions shall return the number of bytes transmitted.

Upon successful completion, the *sprintf*( ) function shall return the number of bytes written to *s*, excluding the terminating null byte.

Upon successful completion, the *snprintf*( ) function shall return the number of bytes that would be written to *s* had *n* been sufficiently large excluding the terminating null byte.

If an output error was encountered, these functions shall return a negative value.

If the value of *n* is zero on a call to *snprintf*( ), nothing shall be written, the number of bytes that would have been written had *n* been sufficiently large excluding the terminating null shall be returned, and *s* may be a null pointer.

ERRORS

For the conditions under which *fprintf*( ) and *printf*( ) fail and may fail, refer to *fputc*( ) or *fputwc*( ).

In addition, all forms of *fprintf*( ) may fail if:

XSI [EILSEQ] A wide-character code that does not correspond to a valid character has been detected.

XSI [EINVAL] There are insufficient arguments.

The *printf*( ) and *fprintf*( ) functions may fail if:

XSI [ENOMEM] Insufficient storage space is available.

The *snprintf*( ) function shall fail if:

XSI [EOVERFLOW] The value of *n* is greater than {INT_MAX} or the number of bytes needed to hold the output excluding the terminating null is greater than {INT_MAX}.

EXAMPLES

Printing Language-Independent Date and Time

The following statement can be used to print date and time using a language-independent format:

```
printf(format, weekday, month, day, hour, min);
```

For American usage, *format* could be a pointer to the following string:

```
"%s, %s %d, %d:%.2d\n"
```

This example would produce the following message:

```
Sunday, July 3, 10:02
```

For German usage, *format* could be a pointer to the following string:

```
"%1$s, %3$d. %2$s, %4$d:%5$.2d\n"
```

This definition of *format* would produce the following message:

```
Sonntag, 3. Juli, 10:02
```

Printing File Information

The following example prints information about the type, permissions, and number of links of a specific file in a directory.

The first two calls to *printf*( ) use data decoded from a previous *stat*( ) call. The user-defined *strperm*( ) function shall return a string similar to the one at the beginning of the output for the following command:

```
ls -l
```

The next call to *printf*( ) outputs the owner's name if it is found using *getpwuid*( ); the *getpwuid*( ) function shall return a **passwd** structure from which the name of the user is extracted. If the user name is not found, the program instead prints out the numeric value of the user ID.

The next call prints out the group name if it is found using *getgrgid*( ); *getgrgid*( ) is very similar to *getpwuid*( ) except that it shall return group information based on the group number. Once again, if the group is not found, the program prints the numeric value of the group for the entry.

The final call to *printf*( ) prints the size of the file.

```
#include <stdio.h>
#include <sys/types.h>
#include <pwd.h>
#include <grp.h>

char *strperm (mode_t);
...
struct stat statbuf;
struct passwd *pwd;
struct group *grp;
...
printf("%10.10s", strperm (statbuf.st_mode));
```

```
13432       printf("%4d", statbuf.st_nlink);
13433       if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
13434           printf(" %-8.8s", pwd->pw_name);
13435       else
13436           printf(" %-8ld", (long) statbuf.st_uid);
13437       if ((grp = getgrgid(statbuf.st_gid)) != NULL)
13438           printf(" %-8.8s", grp->gr_name);
13439       else
13440           printf(" %-8ld", (long) statbuf.st_gid);
13441       printf("%9jd", (intmax_t) statbuf.st_size);
13442       ...
```

13443 **Printing a Localized Date String**

13444 The following example gets a localized date string. The *nl_langinfo*( ) function shall return the
13445 localized date string, which specifies the order and layout of the date. The *strftime*( ) function
13446 takes this information and, using the **tm** structure for values, places the date and time
13447 information into *datestring*. The *printf*( ) function then outputs *datestring* and the name of the
13448 entry.

```
13449       #include <stdio.h>
13450       #include <time.h>
13451       #include <langinfo.h>
13452       ...
13453       struct dirent *dp;
13454       struct tm *tm;
13455       char datestring[256];
13456       ...
13457       strftime(datestring, sizeof(datestring), nl_langinfo (D_T_FMT), tm);
13458       printf(" %s %s\n", datestring, dp->d_name);
13459       ...
```

13460 **Printing Error Information**

13461 The following example uses *fprintf*( ) to write error information to stadard error.

13462 In the first group of calls, the program tries to open the password lock file named **LOCKFILE**. If
13463 the file already exists, this is an error, as indicated by the O_EXCL flag on the *open*( ) function. If
13464 the call fails, the program assumes that someone else is updating the password file, and the
13465 program exits.

13466 The next group of calls saves a new password file as the current password file by creating a link
13467 between **LOCKFILE** and the new password file **PASSWDFILE**.

```
13468       #include <sys/types.h>
13469       #include <sys/stat.h>
13470       #include <fcntl.h>
13471       #include <stdio.h>
13472       #include <stdlib.h>
13473       #include <unistd.h>
13474       #include <string.h>
13475       #include <errno.h>
```

```
#define LOCKFILE "/etc/ptmp"
#define PASSWDFILE "/etc/passwd"
...
int pfd;
...
if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL,
    S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
{
    fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
    exit(1);
}
...
if (link(LOCKFILE,PASSWDFILE) == -1) {
    fprintf(stderr, "Link error: %s\n", strerror(errno));
    exit(1);
}
...
```

Printing Usage Information

The following example checks to make sure the program has the necessary arguments, and uses *fprintf*( ) to print usage information if the expected number of arguments is not present.

```
#include <stdio.h>
#include <stdlib.h>
...
char *Options = "hdbtl";
...
if (argc < 2) {
    fprintf(stderr, "Usage: %s -%s <file\n", argv[0], Options); exit(1);
}
...
```

Formatting a Decimal String

The following example prints a key and data pair on *stdout*. Note use of the '*' (asterisk) in the format string; this ensures the correct number of decimal places for the element based on the number of elements requested.

```
#include <stdio.h>
...
long i;
char *keystr;
int elementlen, len;
...
while (len < elementlen) {
...
    printf("%s Element%0*ld\n", keystr, elementlen, i);
...
}
```

13520 **Creating a File Name**

13521 The following example creates a file name using information from a previous *getpwnam*( )
13522 function that returned the HOME directory of the user.

```
13523 #include <stdio.h>
13524 #include <sys/types.h>
13525 #include <unistd.h>
13526 ...
13527 char filename[PATH_MAX+1];
13528 struct passwd *pw;
13529 ...
13530 sprintf(filename, "%s/%d.out", pw->pw_dir, getpid());
13531 ...
```

13532 **Reporting an Event**

13533 The following example loops until an event has timed out. The *pause*( ) function waits forever
13534 unless it receives a signal. The *fprintf*( ) statement should never occur due to the possible return
13535 values of *pause*( ).

```
13536 #include <stdio.h>
13537 #include <unistd.h>
13538 #include <string.h>
13539 #include <errno.h>
13540 ...
13541 while (!event_complete) {
13542 ...
13543     if (pause() != -1 || errno != EINTR)
13544         fprintf(stderr, "pause: unknown error: %s\n", strerror(errno));
13545 }
13546 ...
```

13547 **Printing Monetary Information**

13548 The following example uses *strfmon*( ) to convert a number and store it as a formatted monetary
13549 string named *convbuf*. If the first number is printed, the program prints the format and the
13550 description; otherwise, it just prints the number.

```
13551 #include <monetary.h>
13552 #include <stdio.h>
13553 ...
13554 struct tblfmt {
13555     char *format;
13556     char *description;
13557 };
13558 struct tblfmt table[] = {
13559     { "%n", "default formatting" },
13560     { "%11n", "right align within an 11 character field" },
13561     { "%#5n", "aligned columns for values up to 99,999" },
13562     { "%=*#5n", "specify a fill character" },
13563     { "%=0#5n", "fill characters do not use grouping" },
13564     { "%^#5n", "disable the grouping separator" },
13565     { "%^#5.0n", "round off to whole units" },
```

```
        { "%^#5.4n", "increase the precision" },
        { "%(#5n", "use an alternative pos/neg style" },
        { "%!(#5n", "disable the currency symbol" },
    };
    ...
    float input[3];
    int i, j;
    char convbuf[100];
    ...
    strfmon(convbuf, sizeof(convbuf), table[i].format, input[j]);
    if (j == 0) {
        printf("%s%s%s\n", table[i].format,
            convbuf, table[i].description);
    }
    else {
        printf("%s\n", convbuf);
    }
    ...
```

APPLICATION USAGE

If the application calling *fprintf*( ) has any objects of type **wint_t** or **wchar_t**, it must also include the **<wchar.h>** header to have these objects defined.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

fputc( ), *fscanf*( ), *setlocale*( ), *wcrtomb*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdio.h>**, **<wchar.h>**, the Base Definitions volume of IEEE Std. 1003.1-200x, Chapter 7, Locale

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

In the DESCRIPTION, references to *langinfo* data are marked as extensions. The reference to *langinfo* data is removed from the description of the radix character.

The ''' (single-quote) flag is added to the list of flag characters and marked as an extension. This flag directs that numeric conversion is formatted with the decimal grouping character.

The detailed description of these functions is provided here instead of under *printf*( ).

The information in the APPLICATION USAGE section is moved to the DESCRIPTION. A new APPLICATION USAGE section is added.

The [EILSEQ] error is added to the ERRORS section and all errors are marked as extensions.

The following changes are incorporated for alignment with the ISO C standard:

- The type of the *format* arguments is changed from **char*** to **const char***.
- The DESCRIPTION is reworded or presented differently in a number of places for alignment with the ISO C standard, and also for clarity. There are no functional changes, except as noted elsewhere in this CHANGE HISTORY section.

The following changes are incorporated for alignment with the MSE working draft:

- The *C* and *S* conversion characters are added, indicating respectively a wide character of type **wchar_t** and pointer to a wide-character string of type **wchar_t*** in the argument list.

Issue 4, Version 2

The [ENOMEM] error is added to the ERRORS section as an optional error.

Issue 5

Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the *l* (ell) qualifier can now be used with *c* and *s* conversion characters.

The *snprintf*( ) function is new in Issue 5.

Issue 6

Extensions beyond the ISO C standard are now marked.

The description of *snprintf*( ) has been aligned with The Open Group Base Resolution bwg98-006. This aligns *snprintf*( ) with historic BSD behavior.

The DESCRIPTION is updated to avoid use of the term ''must'' for application requirements.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The prototypes for *fprintf*( ), *printf*( ), *snprintf*( ), and *sprintf*( ) are updated, and the XSI shading is removed from *snprintf*( ).
- The DESCRIPTION is updated.

13628 **NAME**

13629 fputc — put a byte on a stream

13630 **SYNOPSIS**

13631 `#include <stdio.h>`

13632 `int fputc(int c, FILE *stream);`

13633 **DESCRIPTION**

13634 CX The functionality described on this reference page is aligned with the ISO C standard. Any
13635 conflict between the requirements described here and the ISO C standard is unintentional. This
13636 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

13637 The *fputc*( ) function shall write the byte specified by *c* (converted to an **unsigned char**) to the
13638 output stream pointed to by *stream*, at the position indicated by the associated file-position
13639 indicator for the stream (if defined), and advances the indicator appropriately. If the file cannot
13640 support positioning requests, or if the stream was opened with append mode, the byte shall be
13641 appended to the output stream.

13642 CX The *st_ctime* and *st_mtime* fields of the file shall be marked for update between the successful
13643 execution of *fputc*( ) and the next successful completion of a call to *fflush*( ) or *fclose*( ) on the same
13644 stream or a call to *exit*( ) or *abort*( ).

13645 **RETURN VALUE**

13646 Upon successful completion, *fputc*( ) shall return the value it has written. Otherwise, it shall
13647 CX return EOF, the error indicator for the stream shall be set, and *errno* shall be set to indicate the
13648 error.

13649 **ERRORS**

13650 The *fputc*( ) function shall fail if either the *stream* is unbuffered or the *stream*'s buffer needs to be
13651 flushed, and:

13652 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and the process would be delayed in the write operation. |

13654 CX [EBADF] The file descriptor underlying *stream* is not a valid file descriptor open for writing. |

13656 CX [EFBIG] An attempt was made to write to a file that exceeds the maximum file size. |

13657 XSI [EFBIG] An attempt was made to write to a file that exceeds the process' file size limit. |

13658 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the offset maximum. |

13660 CX [EINTR] The write operation was terminated due to the receipt of a signal, and no data was transferred. |

13662 CX [EIO] A physical I/O error has occurred, or the process is a member of a background process group attempting to write to its controlling terminal, TOSTOP is set, the process is neither ignoring nor blocking SIGTTOU, and the process group of the process is orphaned. This error may also be returned under implementation-defined conditions. |

13667 CX [ENOSPC] There was no free space remaining on the device containing the file. |

13668 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by any process. A SIGPIPE signal shall also be sent to the thread. |

13670 The *fputc*( ) function may fail if:

CX [ENOMEM] Insufficient storage space is available.

CX [ENXIO] A request was made of a nonexistent device, or the request was outside the capabilities of the device.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

In the DESCRIPTION, the text is changed to make it clear that the function writes byte values, rather than (possibly multi-byte) character values.

In the ERRORS section, text is added to indicate that error returns are only generated when either the stream is unbuffered, or if the stream buffer needs to be flushed.

Also in the ERRORS section, in previous issues generation of the [EIO] error depended on whether or not an implementation supported Job Control. This functionality is now defined as mandatory.

The [ENXIO] error is moved to the list of optional errors, and all the optional errors are marked as extensions.

The description of [EINTR] is amended.

The [EFBIG] error is marked to show extensions.

Issue 4, Version 2

In the ERRORS section, the description of [EIO] is updated to include the case where a physical I/O error occurs.

Issue 5

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are now marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EIO] and [EFBIG] mandatory error conditions are added.
- The [ENOMEM] and [ENXIO] optional error conditions are added.

13710 **NAME**

13711 fputs — put a string on a stream

13712 **SYNOPSIS**

13713 ```
#include <stdio.h>
```

13714 ```
int fputs(const char *restrict s, FILE *restrict stream);
```

13715 **DESCRIPTION**

13716 CX The functionality described on this reference page is aligned with the ISO C standard. Any
13717 conflict between the requirements described here and the ISO C standard is unintentional. This
13718 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

13719 The *fputs*( ) function shall write the null-terminated string pointed to by *s* to the stream pointed
13720 to by *stream*. The terminating null byte shall not be written.

13721 CX The *st_ctime* and *st_mtime* fields of the file shall be marked for update between the successful
13722 execution of *fputs*( ) and the next successful completion of a call to *fflush*( ) or *fclose*( ) on the same
13723 stream or a call to *exit*( ) or *abort*( ).

13724 **RETURN VALUE**

13725 Upon successful completion, *fputs*( ) shall return a non-negative number. Otherwise, it shall
13726 CX return EOF, set an error indicator for the stream, and set *errno* to indicate the error.

13727 **ERRORS**

13728 Refer to *fputc*( ).

13729 **EXAMPLES**

13730 **Printing to Standard Output**

13731 The following example gets the current time, converts it to a string using *localtime*( ) and
13732 *asctime*( ), and prints it to standard output using *fputs*( ). It then prints the number of minutes to
13733 an event for which it is waiting.

```
13734 #include <time.h>
13735 #include <stdio.h>
13736 ...
13737 time_t now;
13738 int minutes_to_event;
13739 ...
13740 time(&now);
13741 printf("The time is ");
13742 fputs(asctime(localtime(&now)), stdout);
13743 printf("There are still %d minutes to the event.\n",
13744     minutes_to_event);
13745 ...
```

13746 **APPLICATION USAGE**

13747 The *puts*( ) function appends a <newline> character while *fputs*( ) does not.

13748 **RATIONALE**

13749 None.

13750 **FUTURE DIRECTIONS**

13751 None.

13752 **SEE ALSO**

13753 *fopen*( ), *putc*( ), *puts*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdio.h>**

13754 **CHANGE HISTORY**

13755 First released in Issue 1. Derived from Issue 1 of the SVID.

13756 **Issue 4**

13757 In the DESCRIPTION, the words ‘‘null character’’ are replaced by ‘‘null byte’’, to make it clear
13758 that this function deals solely in byte values.

13759 The following change is incorporated for alignment with the ISO C standard:

13760 • The type of argument *s* is changed from **char*** to **const char***.

13761 **Issue 6**

13762 Extensions beyond the ISO C standard are now marked.

13763 The *fputs*( ) prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

13764 **NAME**

13765 fputwc — put a wide-character code on a stream

13766 **SYNOPSIS**

13767 ```
#include <stdio.h>
```

13768 ```
#include <wchar.h>
```

13769 ```
wint_t fputwc(wchar_t wc, FILE *stream);
```

13770 **DESCRIPTION**

13771 CX The functionality described on this reference page is aligned with the ISO C standard. Any
13772 conflict between the requirements described here and the ISO C standard is unintentional. This
13773 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

13774 The *fputwc*( ) function shall write the character corresponding to the wide-character code *wc* to
13775 the output stream pointed to by *stream*, at the position indicated by the associated file-position
13776 indicator for the stream (if defined), and advances the indicator appropriately. If the file cannot
13777 support positioning requests, or if the stream was opened with append mode, the character is
13778 appended to the output stream. If an error occurs while writing the character, the shift state of |
13779 the output file is left in an undefined state.

13780 CX The *st_ctime* and *st_mtime* fields of the file shall be marked for update between the successful
13781 execution of *fputwc*( ) and the next successful completion of a call to *fflush*( ) or *fclose*( ) on the
13782 same stream or a call to *exit*( ) or *abort*( ).

13783 **RETURN VALUE**

13784 Upon successful completion, *fputwc*( ) shall return *wc*. Otherwise, it shall return WEOF, the error
13785 CX indicator for the stream shall be set set, and *errno* shall be set to indicate the error.

13786 **ERRORS**

13787 The *fputwc*( ) function shall fail if either the stream is unbuffered or data in the *stream*'s buffer
13788 needs to be written, and:

13789 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and the |
13790 process would be delayed in the write operation.

13791 CX [EBADF] The file descriptor underlying *stream* is not a valid file descriptor open for |
13792 writing.

13793 CX [EFBIG] An attempt was made to write to a file that exceeds the maximum file size or |
13794 the process' file size limit.

13795 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the |
13796 offset maximum associated with the corresponding stream.

13797 CX [EINTR] The write operation was terminated due to the receipt of a signal, and no data |
13798 was transferred.

13799 CX [EIO] A physical I/O error has occurred, or the process is a member of a |
13800 background process group attempting to write to its controlling terminal,
13801 TOSTOP is set, the process is neither ignoring nor blocking SIGTTOU, and the
13802 process group of the process is orphaned. This error may also be returned
13803 under implementation-defined conditions. |

13804 CX [ENOSPC] There was no free space remaining on the device containing the file. |

13805 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by |
13806 any process. A SIGPIPE signal shall also be sent to the thread.
```

The *fputwc*( ) function may fail if:

CX [ENOMEM] Insufficient storage space is available.

CX [ENXIO] A request was made of a nonexistent device, or the request was outside the capabilities of the device.

CX [EILSEQ] The wide-character code *wc* does not correspond to a valid character.

EXAMPLES

CHANGE HISTORY

First released in Issue 4. Derived from the MSE working draft.

Issue 4, Version 2

In the ERRORS section, the description of [EIO] is updated to include the case where a physical I/O error occurs.

Issue 5

Aligned with ISO/IEC 9899: 1990/Amendment 1: 1995 (E). Specifically, the type of argument *wc* is changed from **wint_t** to **wchar_t**.

The Optional Header (OH) marking is removed from **<stdio.h>**.

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are now marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EFBIG] and [EIO] mandatory error conditions are added.

13838 **NAME**

13839 fputws — put a wide-character string on a stream

13840 **SYNOPSIS**

13841 ```
#include <stdio.h>
```

13842 ```
#include <wchar.h>
```

13843 ```
int fputws(const wchar_t *restrict ws, FILE *restrict stream);
```

13844 **DESCRIPTION**

13845 CX The functionality described on this reference page is aligned with the ISO C standard. Any
13846 conflict between the requirements described here and the ISO C standard is unintentional. This
13847 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

13848 The *fputws*( ) function shall write a character string corresponding to the (null-terminated)
13849 wide-character string pointed to by *ws* to the stream pointed to by *stream*. No character
13850 corresponding to the terminating null wide-character code shall be written.

13851 CX The *st_ctime* and *st_mtime* fields of the file shall be marked for update between the successful
13852 execution of *fputws*( ) and the next successful completion of a call to *fflush*( ) or *fclose*( ) on the
13853 same stream or a call to *exit*( ) or *abort*( ).

13854 **RETURN VALUE**

13855 Upon successful completion, *fputws*( ) shall return a non-negative number. Otherwise, it shall
13856 CX return –1, set an error indicator for the stream, and set *errno* to indicate the error.

13857 **ERRORS**

13858 Refer to *fputwc*( ).

13859 **EXAMPLES**

13860 None.

13861 **APPLICATION USAGE**

13862 The *fputws*( ) function does not append a <newline> character.

13863 **RATIONALE**

13864 None.

13865 **FUTURE DIRECTIONS**

13866 None.

13867 **SEE ALSO**

13871 **Issue 5**

13872 The Optional Header (OH) marking is removed from **<stdio.h>**.

13873 **Issue 6**

13874 Extensions beyond the ISO C standard are now marked.

13875 The *fputws*( ) prototype is updated for alignment with the ISO / IEC 9899: 1999 standard.
```

NAME

fread — binary input

SYNOPSIS

```
#include <stdio.h>

size_t fread(void *restrict ptr, size_t size, size_t nitems,
    FILE *restrict stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

The *fread*( ) function shall read into the array pointed to by *ptr* up to *nitems* members whose size is specified by *size* in bytes, from the stream pointed to by *stream*. For each object, size calls are made to the *fgetc*( ) function and the results stored, in the order read, in an array of **unsigned char** exactly overlaying the object. The file position indicator for the stream (if defined) is advanced by the number of bytes successfully read. If an error occurs, the resulting value of the file position indicator for the stream is indeterminate. If a partial member is read, its value is indeterminate.

CX The *fread*( ) function may mark the *st_atime* field of the file associated with *stream* for update. The *st_atime* field shall be marked for update by the first successful execution of *fgetc*( ), *fgets*( ), *fgetwc*( ), *fgetws*( ), *fread*( ), *fscanf*( ), *getc*( ), *getchar*( ), *gets*( ), or *scanf*( ) using *stream* that returns data not supplied by a prior call to *ungetc*( ) or *ungetwc*( ).

RETURN VALUE

Upon successful completion, *fread*( ) shall return the number of members successfully read which is less than *nitems* only if a read error or end-of-file is encountered. If *size* or *nitems* is 0, *fread*( ) shall return 0 and the contents of the array and the state of the stream remain unchanged.

CX Otherwise, if a read error occurs, the error indicator for the stream shall be set, and *errno* shall be set to indicate the error.

ERRORS

Refer to *fgetc*( ).

EXAMPLES

Reading from a Stream

The following example reads a single element from the *fp* stream into the array pointed to by *buf*.

```
#include <stdio.h>
...
size_t bytes_read;
char buf[100];
FILE *fp;
...
bytes_read = fread(buf, sizeof(buf), 1, fp);
...
```

APPLICATION USAGE

The *ferror*( ) or *feof*( ) functions must be used to distinguish between an error condition and an end-of-file condition.

Because of possible differences in member length and byte ordering, files written using *fwrite*( ) are application-dependent, and possibly cannot be read using *fread*( ) by a different application

or by the same application on a different processor.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The list of functions that may cause the *st_atime* field to be updated is revised.

The following change is incorporated for alignment with the ISO C standard:

- In the RETURN VALUE section, the behavior if *size* or *nitems* is 0 is defined.

Issue 6

Extensions beyond the ISO C standard are now marked.

The following changes are made for alignment with the ISO / IEC 9899: 1999 standard:

- The *fread*( ) prototype is updated.
- The DESCRIPTION is updated to describe how the bytes from a call to *fgetc*( ) are stored.

NAME

free — free allocated memory

SYNOPSIS

```
#include <stdlib.h>

void free(void *ptr);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

The *free*( ) function shall cause the space pointed to by *ptr* to be deallocated; that is, made available for further allocation. If *ptr* is a null pointer, no action shall occur. Otherwise, if the argument does not match a pointer earlier returned by the *calloc*( ), *malloc*( ), *posix_memalign*( ), or *realloc*( ) function, or if the space is deallocated by a call to *free*( ) or *realloc*( ), the behavior is undefined.

Any use of a pointer that refers to freed space results in undefined behavior.

RETURN VALUE

The *free*( ) function shall return no value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

There is now no requirement for the implementation to support the inclusion of **<malloc.h>**.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

calloc( ), *malloc*( ), *realloc*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdlib.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The APPLICATION USAGE section is changed to record that **<malloc.h>** need no longer be supported on XSI-conformant systems.

The following change is incorporated for alignment with the ISO C standard:

- The DESCRIPTION now states that the behavior is undefined if any use is made of a pointer that refers to freed space. This was implied but not stated explicitly in Issue 3.

Issue 4, Version 2

The DESCRIPTION is updated for X/OPEN UNIX conformance to indicate that the *free*( ) function can also be used to free memory allocated by *valloc*( ).

13980 **Issue 6**

13981 Reference to the *valloc*( ) function is removed.

NAME

freeaddrinfo, getaddrinfo — get address information

SYNOPSIS

```
#include <sys/socket.h>
#include <netdb.h>

void freeaddrinfo(struct addrinfo *ai);
int getaddrinfo(const char *restrict nodename, const char *restrict servname,|
    const struct addrinfo *restrict hints, struct addrinfo **restrict res);|
```

DESCRIPTION

The *freeaddrinfo*( ) function frees one or more **addrinfo** structures returned by *getaddrinfo*( ), along with any additional storage associated with those structures. If the *ai_next* field of the structure is not null, the entire list of structures is freed. The *freeaddrinfo*( ) function shall support the freeing of arbitrary sublists of an **addrinfo** list originally returned by *getaddrinfo*( ).

The *getaddrinfo*( ) function shall translate the name of a service location (for example, a host name) and/or a service name and shall return a set of socket addresses and associated information to be used in creating a socket with which to address the specified service.

The *freeaddrinfo*( ) and *getaddrinfo*( ) functions shall be thread-safe.

The *nodename* and *servname* arguments are either null pointers or pointers to null-terminated strings. One or both of these two arguments shall be supplied by the application as a non-null pointer.

The format of a valid name depends on the protocol family or families. If a specific family is not given and the name could be interpreted as valid within multiple supported families, the implementation shall attempt to resolve the name in all supported families and, in absence of errors, one or more results shall be returned.

If the *nodename* argument is not null, it can be a descriptive name or can be an address string. If IP6 the specified address family is AF_INET, AF_INET6, or AF_UNSPEC, valid descriptive names include host names. If the specified address family is AF_INET or AF_UNSPEC, address strings using Internet standard dot notation as specified in *inet_addr*( ) are valid.

IP6 If the specified address family is AF_INET6 or AF_UNSPEC, standard IPv6 text forms described in *inet_ntop*( ) are valid.

If *nodename* is not null, the requested service location is named by *nodename*; otherwise, the requested service location is local to the caller.

If *servname* is null, the call shall return network-level addresses for the specified *nodename*. If *servname* is not null, it is a null-terminated character string identifying the requested service. This can be either a descriptive name or a numeric representation suitable for use with the address IP6 family or families. If the specified address family is AF_INET, AF_INET6, or AF_UNSPEC, the service can be specified as a string specifying a decimal port number.

If the *hints* argument is not null, it refers to a structure containing input values that may direct the operation by providing options and by limiting the returned information to a specific socket type, address family and/or protocol. In this *hints* structure every member other than *ai_flags*, *ai_family*, *ai_socktype*, and *ai_protocol* shall be set to zero or a null pointer. A value of AF_UNSPEC for *ai_family* means that the caller shall accept any protocol family. A value of zero for *ai_socktype* means that the caller shall accept any socket type. A value of zero for *ai_protocol* means that the caller shall accept any protocol. If *hints* is a null pointer, the behavior shall be as if it referred to a structure containing the value zero for the *ai_flags*, *ai_socktype*, and *ai_protocol* fields, and AF_UNSPEC for the *ai_family* field.

Notes:

1. If the caller handles only TCP and not UDP, for example, then the *ai_protocol* member of the *hints* structure should be set to IPPROTO_TCP when *getaddrinfo*( ) is called.
2. If the caller handles only IPv4 and not IPv6, then the *ai_family* member of the *hints* structure should be set to PF_INET when *getaddrinfo*( ) is called.

The *ai_flags* field to which the *hints* parameter points shall be set to zero or be the bitwise-inclusive OR of one or more of the values AI_PASSIVE, AI_CANONNAME, and AI_NUMERICHOST.

If the AI_PASSIVE flag is specified, the returned address information shall be suitable for use in binding a socket for accepting incoming connections for the specified service. In this case, if the *nodename* argument is null, then the IP address portion of the socket address structure shall be set to INADDR_ANY for an IPv4 address or IN6ADDR_ANY_INIT for an IPv6 address. If the AI_PASSIVE flag is not specified, the returned address information shall be suitable for a call to *connect*( ) (for a connection-mode protocol) or for a call to *connect*( ), *sendto*( ), or *sendmsg*( ) (for a connectionless protocol). In this case, if the *nodename* argument is null, then the IP address portion of the socket address structure shall be set to the loopback address.

If the AI_CANONNAME flag is specified and the *nodename* argument is not null, the function attempts to determine the canonical name corresponding to *nodename* (for example, if *nodename* is an alias or shorthand notation for a complete name).

If the AI_NUMERICHOST flag is specified, then a non-null *nodename* string supplied shall be a numeric host address string. Otherwise, an [EAI_NONAME] error is returned. This flag prevents any type of name resolution service (for example, the DNS) from being invoked.

If the AI_NUMERICSERV flag is specified, then a non-null *servname* string supplied shall be a numeric port string. Otherwise, an [EAI_NONAME] error is returned. This flag prevents any type of name resolution service (for example, NIS+) from being invoked.

The *ai_socktype* field to which argument *hints* points specifies the socket type for the service, as defined in *socket*( ). If a specific socket type is not given (for example, a value of zero) and the service name could be interpreted as valid with multiple supported socket types, the implementation shall attempt to resolve the service name for all supported socket types and, in the absence of errors, all possible results shall be returned. A non-zero socket type value shall limit the returned information to values with the specified socket type.

If the *ai_family* field to which *hints* points has the value AF_UNSPEC, addresses are returned for use with any protocol family that can be used with the specified *nodename* and/or *servname*. Otherwise, addresses are returned for use only with the specified protocol family. If *ai_family* is not AF_UNSPEC and *ai_protocol* is not zero, then addresses are returned for use only with the specified protocol family and protocol; the value of *ai_protocol* is interpreted as in a call to the *socket*( ) function with the corresponding values of *ai_family* and *ai_protocol*.

RETURN VALUE

A zero return value for *getaddrinfo*( ) indicates successful completion; a non-zero return value indicates failure. The possible values for the failures are listed in the ERRORS section.

Upon successful return of *getaddrinfo*( ), the location to which *res* points refers to a linked list of **addrinfo** structures, each of which specifies a socket address and information for use in creating a socket with which to use that socket address. The list shall include at least one **addrinfo** structure. The *ai_next* field of each structure contains a pointer to the next structure on the list, or a null pointer if it is the last structure on the list. Each structure on the list includes values for use with a call to the *socket*( ) function, and a socket address for use with the *connect*( ) function or, if

the AI_PASSIVE flag was specified, for use with the *bind*( ) function. The fields *ai_family*, *ai_socktype*, and *ai_protocol* are usable as the arguments to the *socket*( ) function to create a socket suitable for use with the returned address. The fields *ai_addr* and *ai_addrlen* are usable as the arguments to the *connect*( ) or *bind*( ) functions with such a socket, according to the AI_PASSIVE flag.

If *nodename* is not null, and if requested by the AI_CANONNAME flag, the *ai_canonname* field of the first returned **addrinfo** structure points to a null-terminated string containing the canonical name corresponding to the input *nodename*; if the canonical name is not available, then *ai_canonname* refers to the *nodename* argument or a string with the same contents. The contents of the *ai_flags* field of the returned structures are undefined.

All fields in socket address structures returned by *getaddrinfo*( ) that are not filled in through an explicit argument (for example, *sin6_flowinfo* and *sin_zero*) shall be set to zero.

Note: This makes it easier to compare socket address structures.

ERRORS

The *getaddrinfo*( ) function shall fail and return the corresponding value if:

[EAI_AGAIN] The name could not be resolved at this time. Future attempts may succeed.

[EAI_BADFLAGS] The *flags* parameter had an invalid value.

[EAI_FAIL] A non-recoverable error occurred when attempting to resolve the name.

[EAI_FAMILY] The address family was not recognized.

[EAI_MEMORY] There was a memory allocation failure when trying to allocate storage for the return value.

[EAI_NONAME] The name does not resolve for the supplied parameters.

Neither *nodename* nor *servname* were supplied. At least one of these shall be supplied.

[EAI_SERVICE] The service passed was not recognized for the specified socket type.

[EAI_SOCKTYPE] The intended socket type was not recognized.

[EAI_SYSTEM] A system error occurred; the error code can be found in *errno*.

14115 **CHANGE HISTORY**

14116 First released in Issue 6. Derived from the XNS, Issue 5.2 specification. |

14117 The **restrict** keyword is added to the *getaddrinfo*() prototype for alignment with the |
14118 ISO/IEC 9899:1999 standard. |

14119 **NAME**

14120 freehostent — network host database functions

14121 **SYNOPSIS**

14122 `#include <netdb.h>`

14123 `void freehostent(struct hostent *`*`ptr`*`);`

14124 **DESCRIPTION**

14125 Refer to *endhostent*( ).

14126 **NAME**

14127 freopen — open a stream

14128 **SYNOPSIS**

14129 `#include <stdio.h>`

14130 `FILE *freopen(const char *restrict filename, const char *restrict mode,`
14131 `FILE *restrict stream);`

14132 **DESCRIPTION**

14133 CX The functionality described on this reference page is aligned with the ISO C standard. Any
14134 conflict between the requirements described here and the ISO C standard is unintentional. This
14135 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

14136 The *freopen*( ) function shall first attempt to flush the stream and close any file descriptor
14137 associated with *stream*. Failure to flush or close the file successfully shall be ignored. The error
14138 and end-of-file indicators for the stream shall be cleared.

14139 The *freopen*( ) function shall open the file whose path name is the string pointed to by *filename*
14140 and associate the stream pointed to by *stream* with it. The *mode* argument shall be used just as in
14141 *fopen*( ).

14142 The original stream shall be closed regardless of whether the subsequent open succeeds.

14143 If *filename* is a null pointer, the *freopen*( ) function shall attempt to change the mode of the stream
14144 to that specified by *mode*, as if the name of the file currently associated with the stream had been
14145 used. It is implementation-defined which changes of mode are permitted (if any), and under
14146 what circumstances.

14147 XSI After a successful call to the *freopen*( ) function, the orientation of the stream shall be cleared, the
14148 encoding rule shall be cleared, and the associated **mbstate_t** object shall be set to describe an
14149 initial conversion state.

14150 CX The largest value that can be represented correctly in an object of type **off_t** shall be established
14151 as the offset maximum in the open file description.

14152 **RETURN VALUE**

14153 Upon successful completion, *freopen*( ) shall return the value of *stream*. Otherwise, a null pointer
14154 CX shall be returned, and *errno* shall be set to indicate the error.

14155 **ERRORS**

14156 The *freopen*( ) function shall fail if:

14157 CX [EACCES] Search permission is denied on a component of the path prefix, or the file
14158 exists and the permissions specified by *mode* are denied, or the file does not
14159 exist and write permission is denied for the parent directory of the file to be
14160 created.

14161 CX [EINTR] A signal was caught during *freopen*( ).

14162 CX [EISDIR] The named file is a directory and *mode* requires write access.

14163 CX [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
14164 argument.

14165 CX [EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

14166 CX [ENAMETOOLONG]
14167 The length of the *filename* argument exceeds {PATH_MAX} or a path name
14168 component is longer than {NAME_MAX}.

14169 CX [ENFILE] The maximum allowable number of files is currently open in the system.

14170 CX [ENOENT] A component of *filename* does not name an existing file or *filename* is an empty
14171 string.

14172 CX [ENOSPC] The directory or file system that would contain the new file cannot be
14173 expanded, the file does not exist, and it was to be created.

14174 CX [ENOTDIR] A component of the path prefix is not a directory.

14175 CX [ENXIO] The named file is a character special or block special file, and the device
14176 associated with this special file does not exist.

14177 CX [EOVERFLOW] The named file is a regular file and the size of the file cannot be represented
14178 correctly in an object of type **off_t**.

14179 CX [EROFS] The named file resides on a read-only file system and *mode* requires write
14180 access.

14181 The *freopen*( ) function may fail if:

14182 CX [EINVAL] The value of the *mode* argument is not valid.

14183 CX [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
14184 resolution of the *path* argument.

14185 CX [ENAMETOOLONG]
14186 Path name resolution of a symbolic link produced an intermediate result
14187 whose length exceeds {PATH_MAX}.

14188 CX [ENOMEM] Insufficient storage space is available.

14189 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
14190 capabilities of the device.

14191 CX [ETXTBSY] The file is a pure procedure (shared text) file that is being executed and *mode*
14192 requires write access.

14193 **EXAMPLES**

14194 **Directing Standard Output to a File**

14195 The following example logs all standard output to the **/tmp/logfile** file.

```
14196 #include <stdio.h>
14197 ...
14198 FILE *fp;
14199 ...
14200 fp = freopen ("/tmp/logfile", "a+", stdout);
14201 ...
```

14202 **APPLICATION USAGE**

14203 The *freopen*( ) function is typically used to attach the preopened *streams* associated with *stdin*,
14204 *stdout*, and *stderr* to other files.

14205 **RATIONALE**

14206 None.

14207 **FUTURE DIRECTIONS**

14208 None.

14209 **SEE ALSO**

14210 *fclose*( ), *fopen*( ), *fdopen*( ), *mbsinit*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, |
14211 **<stdio.h>**

14212 **CHANGE HISTORY**

14213 First released in Issue 1. Derived from Issue 1 of the SVID. |

14214 **Issue 4**

14215 In the DESCRIPTION, the word ''name'' is replaced by ''path name'', to make it clear that the
14216 function is not limited to accepting file names only.

14217 In the ERRORS section:

14218 • The description of the [EMFILE] error has been changed to refer to {OPEN_MAX} file
14219 descriptors rather than {FOPEN_MAX} file descriptors, directories, and message catalogs.

14220 • The errors [EINVAL], [ENOMEM], and [ETXTBSY] are marked as extensions.

14221 • The [ENXIO] error is added in the ''may fail'' section and marked as an extension.

14222 The following change is incorporated for alignment with the ISO C standard:

14223 • The type of arguments *filename* and *mode* are changed from **char*** to **const char***.

14224 The following change is incorporated for alignment with the FIPS requirements:

14225 • In the ERRORS section, the condition whereby [ENAMETOOLONG] is returned if a path
14226 name component is larger that {NAME_MAX} is now defined as mandatory and marked as
14227 an extension.

14228 **Issue 4, Version 2**

14229 The ERRORS section is updated for X/OPEN UNIX conformance as follows:

14230 • It states that [ELOOP] is returned if too many symbolic links are encountered during path
14231 name resolution.

14232 • A second [ENAMETOOLONG] condition is defined that may report excessive length of an
14233 intermediate result of path name resolution of a symbolic link.

14234 **Issue 5**

14235 The DESCRIPTION is updated to indicate that the orientation of the stream is cleared and the
14236 conversion state of the stream is set to an initial conversion state by a successful call to the
14237 *freopen*( ) function.

14238 Large File Summit extensions are added.

14239 **Issue 6**

14240 Extensions beyond the ISO C standard are now marked.

14241 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

14242 • The [ENAMETOOLONG] error is restored as an error dependent on _POSIX_NO_TRUNC.
14243 This is since behavior may vary from one file system to another.

14244 The following new requirements on POSIX implementations derive from alignment with the
14245 Single UNIX Specification:

14246 • In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file
14247 description. This change is to support large files.

- In the ERRORS section, the [EOVERFLOW] condition is added. This change is to support large files.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.
- The [EINVAL], [ENOMEM], [ENXIO], and [ETXTBSY] optional error conditions are added.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The *freopen*() prototype is updated.
- The DESCRIPTION is updated.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

14258 **NAME**

14259 frexp, frexpf, frexpl — extract mantissa and exponent from a double precision number

14260 **SYNOPSIS**

14261 `#include <math.h>`

14262 `double frexp(double num, int *exp);`
14263 `float frexpf(float value, int *exp);`
14264 `long double frexpl(long double value, int *exp);`

14265 **DESCRIPTION**

14266 CX The functionality described on this reference page is aligned with the ISO C standard. Any
14267 conflict between the requirements described here and the ISO C standard is unintentional. This
14268 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

14269 These functions breaks a floating-point number into a normalized fraction and an integral power
14270 of 2. It stores the integer exponent in the **int** object pointed to by *exp*.

14271 An application wishing to check for error situations should set *errno* to 0 before calling *frexp*( ). If
14272 *errno* is non-zero on return, or the return value is NaN, an error has occurred.

14273 **RETURN VALUE**

14274 These functions shall return the value *x*, such that *x* has a magnitude in the interval [½,1) or 0,
14275 and *num* equals *x* times 2 raised to the power **exp*.

14276 If *num* is 0, both parts of the result shall be 0.

14277 XSI If *num* is NaN, NaN shall be returned, *errno* may be set to [EDOM], and the value of **exp* shall be
14278 unspecified.

14279 If *num* is ±Inf, *num* shall be returned, *errno* may be set to [EDOM], and the value of **exp* shall be
14280 unspecified.

14281 **ERRORS**

14282 These functions may fail if:

14283 XSI [EDOM] The value of *num* is NaN or ±Inf.

14284 XSI No other errors shall occur.

14285 **EXAMPLES**

14286 None.

14287 **APPLICATION USAGE**

14288 None.

14289 **RATIONALE**

14290 None.

14291 **FUTURE DIRECTIONS**

14292 None.

14293 **SEE ALSO**

14294 *isnan*( ), *ldexp*( ), *modf*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<math.h>**

14295 **CHANGE HISTORY**

14296 First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

References to *matherr*( ) are removed.

The name of the first argument is changed from *value* to *num*.

The RETURN VALUE and ERRORS sections are substantially rewritten for alignment with the ISO C standard and to rationalize error handling in the mathematics functions.

The return value specified for [EDOM] is marked as an extension.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *frexpf*( ) and *frexpl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

14309 **NAME**

14310 fscanf, scanf, sscanf — convert formatted input

14311 **SYNOPSIS**

14312 `#include <stdio.h>`

14313 `int fscanf(FILE *restrict stream, const char *restrict format, ... );`
14314 `int scanf(const char *restrict format, ... );`
14315 `int sscanf(const char *restrict s, const char *restrict format, ... );`

14316 **DESCRIPTION**

14317 CX The functionality described on this reference page is aligned with the ISO C standard. Any
14318 conflict between the requirements described here and the ISO C standard is unintentional. This
14319 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

14320 The *fscanf*( ) function reads from the named input *stream*. The *scanf*( ) function reads from the
14321 standard input stream *stdin*. The *sscanf*( ) function reads from the string *s*. Each function reads
14322 bytes, interprets them according to a format, and stores the results in its arguments. Each
14323 expects, as arguments, a control string *format* described below, and a set of *pointer* arguments
14324 indicating where the converted input should be stored. The result is undefined if there are
14325 insufficient arguments for the format. If the format is exhausted while arguments remain, the
14326 excess arguments are evaluated but are otherwise ignored.

14327 XSI Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than
14328 to the next unused argument. In this case, the conversion character '%' (see below) is replaced
14329 by the sequence "%n$", where *n* is a decimal integer in the range [1,{NL_ARGMAX}]. This
14330 feature provides for the definition of format strings that select arguments in an order
14331 appropriate to specific languages. In format strings containing the "%n$" form of conversion
14332 specifications, it is unspecified whether numbered arguments in the argument list can be
14333 referenced from the format string more than once.

14334 The *format* can contain either form of a conversion specification—that is, '%' or "%n$"—but the
14335 two forms cannot normally be mixed within a single *format* string. The only exception to this is
14336 that "%%" or "%*" can be mixed with the "%n$" form.

14337 The *fscanf*( ) function in all its forms allows for detection of a language-dependent radix
14338 character in the input string. The radix character is defined in the program's locale (category
14339 *LC_NUMERIC*). In the POSIX locale, or in a locale where the radix character is not defined, the
14340 radix character defaults to a period ('.').

14341 The format is a character string, beginning and ending in its initial shift state, if any, composed
14342 of zero or more directives. Each directive is composed of one of the following: one or more
14343 white-space characters (<space>, <tab>, <newline>, <vertical-tab>, or <form-feed> characters);
14344 an ordinary character (neither '%' nor a white-space character); or a conversion specification.
14345 XSI Each conversion specification is introduced by the character '%' or the character sequence
14346 "%n$", after which the following appear in sequence:

14347 • An optional assignment-suppressing character '*'.

14348 • An optional non-zero decimal integer that specifies the maximum field width.

14349 • An option length modifier that specifies the size of the receiving object.

14350 • A conversion character that specifies the type of conversion to be applied. The valid
14351 conversion characters are described below.

14352 The *fscanf*( ) functions execute each directive of the format in turn. If a directive fails, as detailed
14353 below, the function shall return. Failures are described as input failures (due to the
14354 unavailability of input bytes) or matching failures (due to inappropriate input).

A directive composed of one or more white-space characters is executed by reading input until no more valid input can be read, or up to the first byte which is not a white-space character, which remains unread.

A directive that is an ordinary character is executed as follows: the next byte is read from the input and compared with the byte that comprises the directive; if the comparison shows that they are not equivalent, the directive fails, and the differing and subsequent bytes remain unread. Similarly, if end-of-file, an encoding error, or a read error prevents a character from being read, the directive fails.

A directive that is a conversion specification defines a set of matching input sequences, as described below for each conversion character. A conversion specification is executed in the following steps:

Input white-space characters (as specified by *isspace*()) are skipped, unless the conversion specification includes a '[', *c*, *C*, or *n* conversion character.

An item is read from the input, unless the conversion specification includes an *n* conversion character. An input item is defined as the longest sequence of input bytes (up to any specified maximum field width, which may be measured in characters or bytes dependent on the conversion character) which is an initial subsequence of a matching sequence. The first byte, if any, after the input item remains unread. If the length of the input item is 0, the execution of the conversion specification fails; this condition is a matching failure, unless end-of-file, an encoding error, or a read error prevented input from the stream, in which case it is an input failure.

Except in the case of a '%' conversion character, the input item (or, in the case of a %*n* conversion specification, the count of input bytes) is converted to a type appropriate to the conversion character. If the input item is not a matching sequence, the execution of the conversion specification fails; this condition is a matching failure. Unless assignment suppression was indicated by a '*', the result of the conversion is placed in the object pointed to by the first argument following the *format* argument that has not already received a conversion result if the conversion specification is introduced by '%', or in the *n*th argument if introduced by the character sequence "%n$". If this object does not have an appropriate type, or if the result of the conversion cannot be represented in the space provided, the behavior is undefined.

XSI

The length modifiers and their meanings are:

hh Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an argument with type pointer to **signed char** or **unsigned char**.

h Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an argument with type pointer to **short** or **unsigned short**.

l (ell) Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an argument with type pointer to **long** or **unsigned long**; that a following *a*, *A*, *e*, *E*, *f*, *F*, *g*, or *G* conversion specifier applies to an argument with type pointer to **double**; or that a following *c*, *s*, or '[' conversion specifier applies to an argument with type pointer to **wchar_t**.

ll (ell-ell) Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an argument with type pointer to **long long** or **unsigned long long**.

j Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an argument with type pointer to **intmax_t** or **uintmax_t**.

z Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an argument with type pointer to **size_t** or the corresponding signed integer type.

14401 *t* Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an argument
14402 with type pointer to **ptrdiff_t** or the corresponding **unsigned** type.

14403 *L* Specifies that a following *a*, *A*, *e*, *E*, *f*, *F*, *g*, or *G* conversion specifier applies to an
14404 argument with type pointer to **long double**.

14405 If a length modifier appears with any conversion specifier other than as specified above, the
14406 behavior is undefined.

14407 The following conversion characters are valid:

14408 *d* Matches an optionally signed decimal integer, whose format is the same as expected for
14409 the subject sequence of *strtol*( ) with the value 10 for the *base* argument. In the absence
14410 of a size modifier, the application shall ensure that the corresponding argument is a
14411 pointer to **int**.

14412 *i* Matches an optionally signed integer, whose format is the same as expected for the
14413 subject sequence of *strtol*( ) with 0 for the *base* argument. In the absence of a size
14414 modifier, the application shall ensure that the corresponding argument is a pointer to
14415 **int**.

14416 *o* Matches an optionally signed octal integer, whose format is the same as expected for
14417 the subject sequence of *strtoul*( ) with the value 8 for the *base* argument. In the absence
14418 of a size modifier, the application shall ensure that the corresponding argument is a
14419 pointer to **unsigned**.

14420 *u* Matches an optionally signed decimal integer, whose format is the same as expected for
14421 the subject sequence of *strtoul*( ) with the value 10 for the *base* argument. In the absence
14422 of a size modifier, the application shall ensure that the corresponding argument is a
14423 pointer to **unsigned**.

14424 *x* Matches an optionally signed hexadecimal integer, whose format is the same as
14425 expected for the subject sequence of *strtoul*( ) with the value 16 for the *base* argument. In
14426 the absence of a size modifier, the application shall ensure that the corresponding
14427 argument is a pointer to **unsigned**.

14428 *a*, *e*, *f*, *g* Matches an optionally signed floating-point number, infinity, or NaN, whose format is
14429 the same as expected for the subject sequence of *strtod*( ). In the absence of a size
14430 modifier, the application shall ensure that the corresponding argument is a pointer to
14431 **float**.

14432 If the *fprintf*( ) family of functions generates character string representations for infinity
14433 and NaN (a symbolic entity encoded in floating-point format) to support
14434 IEEE Std. 754-1985, the *fscanf*( ) family of functions shall recognize them as input.

14435 *s* Matches a sequence of bytes that are not white-space characters. The application shall
14436 ensure that the corresponding argument is a pointer to the initial byte of an array of
14437 **char**, **signed char**, or **unsigned char** large enough to accept the sequence and a
14438 terminating null character code, which shall be added automatically.

14439 If an *l* (ell) qualifier is present, the input is a sequence of characters that begins in the
14440 initial shift state. Each character is converted to a wide character as if by a call to the
14441 *mbrtowc*( ) function, with the conversion state described by an **mbstate_t** object
14442 initialized to zero before the first character is converted. The application shall ensure
14443 that the corresponding argument is a pointer to an array of **wchar_t** large enough to
14444 accept the sequence and the terminating null wide character, which shall be added
14445 automatically.

[Matches a non-empty sequence of bytes from a set of expected bytes (the *scanset*). The normal skip over white-space characters is suppressed in this case. The application shall ensure that the corresponding argument is a pointer to the initial byte of an array of **char**, **signed char**, or **unsigned char** large enough to accept the sequence and a terminating null byte, which shall be added automatically.

If an *l* (ell) qualifier is present, the input is a sequence of characters that begins in the initial shift state. Each character in the sequence is converted to a wide character as if by a call to the *mbrtowc*( ) function, with the conversion state described by an **mbstate_t** object initialized to zero before the first character is converted. The application shall ensure that the corresponding argument is a pointer to an array of **wchar_t** large enough to accept the sequence and the terminating null wide character, which shall be added automatically.

The conversion specification includes all subsequent bytes in the *format* string up to and including the matching right square bracket (']'). The bytes between the square brackets (the *scanlist*) comprise the scanset, unless the byte after the left square bracket is a circumflex ('^'), in which case the scanset contains all bytes that do not appear in the scanlist between the circumflex and the right square bracket. If the conversion specification begins with "[]" or "[^]", the right square bracket is included in the scanlist and the next right square bracket is the matching right square bracket that ends the conversion specification; otherwise, the first right square bracket is the one that ends the conversion specification. If a '–' is in the scanlist and is not the first character, nor the second where the first character is a '^', nor the last character, the behavior is implementation-defined.

c Matches a sequence of bytes of the number specified by the field width (1 if no field width is present in the conversion specification). The application shall ensure that the corresponding argument is a pointer to the initial byte of an array of **char**, **signed char**, or **unsigned char** large enough to accept the sequence. No null byte is added. The normal skip over white-space characters is suppressed in this case.

If an *l* (ell) qualifier is present, the input is a sequence of characters that begins in the initial shift state. Each character in the sequence is converted to a wide character as if by a call to the *mbrtowc*( ) function, with the conversion state described by an **mbstate_t** object initialized to zero before the first character is converted. The application shall ensure that the corresponding argument is a pointer to an array of **wchar_t** large enough to accept the resulting sequence of wide characters. No null wide character is added.

p Matches an implementation-defined set of sequences, which shall be the same as the set of sequences that is produced by the %*p* conversion of the corresponding *fprintf*( ) functions. The application shall ensure that the corresponding argument is a pointer to a pointer to **void**. The interpretation of the input item is implementation-defined. If the input item is a value converted earlier during the same program execution, the pointer that results shall compare equal to that value; otherwise, the behavior of the %*p* conversion is undefined.

n No input is consumed. The application shall ensure that the corresponding argument is a pointer to the integer into which is to be written the number of bytes read from the input so far by this call to the *fscanf*( ) functions. Execution of a %*n* conversion specification does not increment the assignment count returned at the completion of execution of the function. No argument is converted, but one is consumed. If the conversion specification includes an assignment-suppressing character or a field width, the behavior is undefined.

14495 XSI *C* Same as *lc*.

14496 XSI *S* Same as *ls*.

14497 % Matches a single '%'; no conversion or assignment occurs. The complete conversion
14498 specification shall be "%%".

14499 If a conversion specification is invalid, the behavior is undefined.

14500 The conversion characters *A*, *E*, *F*, *G*, and *X* are also valid and behave the same as, respectively, *a*,
14501 *e*, *f*, *g*, and *x*.

14502 If end-of-file is encountered during input, conversion is terminated. If end-of-file occurs before
14503 any bytes matching the current conversion specification (except for %*n*) have been read (other
14504 than leading white-space characters, where permitted), execution of the current conversion
14505 specification terminates with an input failure. Otherwise, unless execution of the current
14506 conversion specification is terminated with a matching failure, execution of the following
14507 conversion specification (if any) is terminated with an input failure.

14508 Reaching the end of the string in *sscanf*( ) is equivalent to encountering end-of-file for *fscanf*( ).

14509 If conversion terminates on a conflicting input, the offending input is left unread in the input.
14510 Any trailing white space (including newline characters) is left unread unless matched by a
14511 conversion specification. The success of literal matches and suppressed assignments is only
14512 directly determinable via the %*n* conversion specification.

14513 The *fscanf*( ) and *scanf*( ) functions may mark the *st_atime* field of the file associated with *stream*
14514 for update. The *st_atime* field shall be marked for update by the first successful execution of
14515 *fgetc*( ), *fgets*( ), *fread*( ), *getc*( ), *getchar*( ), *gets*( ), *fscanf*( ), or *fscanf*( ) using *stream* that returns data
14516 not supplied by a prior call to *ungetc*( ).

14517 **RETURN VALUE**

14518 Upon successful completion, these functions shall return the number of successfully matched
14519 and assigned input items; this number can be 0 in the event of an early matching failure. If the
14520 input ends before the first matching failure or conversion, EOF shall be returned. If a read error
14521 CX occurs, the error indicator for the stream is set, EOF shall be returned, and *errno* shall be set to
14522 indicate the error.

14523 **ERRORS**

14524 For the conditions under which the *fscanf*( ) functions fail and may fail, refer to *fgetc*( ) or
14525 *fgetwc*( ).

14526 In addition, *fscanf*( ) may fail if:

14527 XSI [EILSEQ] Input byte sequence does not form a valid character.

14528 XSI [EINVAL] There are insufficient arguments.

14529 **EXAMPLES**

14530 The call:

```
14531 int i, n; float x; char name[50];
14532 n = scanf("%d%f%s", &i, &x, name);
```

14533 with the input line:

```
14534 25 54.32E-1 Hamster
```

14535 assigns to *n* the value 3, to *i* the value 25, to *x* the value 5.432, and *name* contains the string
14536 "Hamster".

The call:

```
int i; float x; char name[50];
(void) scanf("%2d%f%*d %[0123456789]", &i, &x, name);
```

with input:

```
56789 0123 56a72
```

assigns 56 to *i*, 789.0 to *x*, skips 0123, and places the string `"56\0"` in *name*. The next call to *getchar*( ) shall return the character `'a'`.

Reading Data into an Array

The following call uses *fscanf*( ) to read three floating point numbers from standard input into the *input* array.

```
float input[3];
fscanf (stdin, "%f %f %f", input, input+1, input+2);
```

APPLICATION USAGE

If the application calling *fscanf*( ) has any objects of type **wint_t** or **wchar_t**, it must also include the **<wchar.h>** header to have these objects defined.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

Use of the terms ‘‘byte’’ and ‘‘character’’ is rationalized to make it clear when single-byte and multi-byte values can be used. Similarly, use of the terms ‘‘conversion specification’’ and ‘‘conversion character’’ is now more precise.

Various errors are corrected. For example, the description of the *d* conversion character contained an erroneous reference to *strtod*( ) in Issue 3. This is replaced in this issue by reference to *strtol*( ).

The DESCRIPTION is updated in a number of places to indicate further implications of the `"%n$"` form of a conversion. All references to this functionality, which is not specified in the ISO C standard, are marked as extensions.

The ERRORS section is changed to refer to the entries for *fgetc*( ) and *fgetwc*( ), the [EINVAL] error is marked as an extension, and the [EILSEQ] error is added and marked as an extension.

The detailed description of this function including the CHANGE HISTORY section for *scanf*( ) is provided here instead of under *scanf*( ).

The APPLICATION USAGE section is amended to record the need for **<sys/types.h>** or **<stddef.h>** if type **wchar_t** is required.

The following changes are incorporated for alignment with the ISO C standard:

- The type of the argument *format* for all functions, and the type of argument *s* for *sscanf*( ), are changed from **char*** to **const char***.
- The description is updated in various places to align more closely with the text of the ISO C standard. In particular, this issue fully defines the *L* conversion character, allows for the support of multi-byte coded character sets (although these are not mandated by X/Open), and fills in a number of gaps in the definition (for example, by defining termination conditions for *sscanf*( ).
- Following an ANSI interpretation, the effect of conversion specifications that consume no input is better defined, and is no longer marked as an extension.

The following change is incorporated for alignment with the MSE working draft.

- The *C* and *S* conversion characters are added, indicating a pointer in the argument list to the initial wide-character code of an array large enough to accept the input sequence.

Issue 5

Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the *l* (ell) qualifier is now defined for the *c*, *s*, and ′[′ conversion characters.

The DESCRIPTION is updated to indicate that if infinity and NaN can be generated by the *fprintf*( ) family of functions, then they are recognized by the *fscanf*( ) family.

Issue 6

The Open Group corrigenda items U021/7 and U028/10 have been applied. These correct several occurrences of ‘‘characters’’ in the text which have been replaced with the term ‘‘bytes’’.

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The prototypes for *fscanf*( ), *scanf*( ), and *sscanf*( ) are updated.
- The DESCRIPTION is updated.

14603 **NAME**

14604 fseek, fseeko — reposition a file-position indicator in a stream

14605 **SYNOPSIS**

14606 ```
#include <stdio.h>
```

14607 ```
int fseek(FILE *stream, long offset, int whence);
```

14608 CX ```
int fseeko(FILE *stream, off_t offset, int whence);
```

14609

14610 **DESCRIPTION**

14611 CX The functionality described on this reference page is aligned with the ISO C standard. Any
14612 conflict between the requirements described here and the ISO C standard is unintentional. This
14613 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

14614 The *fseek*( ) function shall set the file-position indicator for the stream pointed to by *stream*. If a
14615 read or write error occurs, the error indicator for the stream shall be set and *fseek*( ) fails.

14616 The new position, measured in bytes from the beginning of the file, shall be obtained by adding
14617 *offset* to the position specified by *whence*. The specified point is the beginning of the file for
14618 {SEEK_SET}, the current value of the file-position indicator for {SEEK_CUR}, or end-of-file for
14619 {SEEK_END}.

14620 If the stream is to be used with wide-character input/output functions, the application shall
14621 ensure that *offset* is either 0 or a value returned by an earlier call to *ftell*( ) on the same stream and
14622 *whence* is {SEEK_SET}.

14623 A successful call to *fseek*( ) shall clear the end-of-file indicator for the stream and undo any effects
14624 of *ungetc*( ) and *ungetwc*( ) on the same stream. After an *fseek*( ) call, the next operation on an
14625 update stream may be either input or output.

14626 If the most recent operation, other than *ftell*( ), on a given stream is *fflush*( ), the file offset in the
14627 underlying open file description shall be adjusted to reflect the location specified by *fseek*( ).

14628 The *fseek*( ) function shall allow the file-position indicator to be set beyond the end of existing
14629 data in the file. If data is later written at this point, subsequent reads of data in the gap shall
14630 return bytes with the value 0 until data is actually written into the gap.

14631 CX The behavior of *fseek*( ) on devices which are incapable of seeking is implementation-defined.
14632 The value of the file offset associated with such a device is undefined.

14633 If the stream is writable and buffered data had not been written to the underlying file, *fseek*( )
14634 shall cause the unwritten data to be written to the file and shall mark the *st_ctime* and *st_mtime*
14635 fields of the file for update.

14636 In a locale with state-dependent encoding, whether *fseek*( ) restores the stream's shift state is
14637 implementation-defined.

14638 The *fseeko*( ) function is equivalent to the *fseek*( ) function except that the *offset* argument is of
14639 type **off_t**.

14640 **RETURN VALUE**

14641 CX The *fseek*( ) and *fseeko*( ) functions shall return 0 if they succeed.

14642 CX Otherwise, they shall return –1 and set *errno* to indicate the error.

14643 **ERRORS**

14644 CX The *fseek*( ) and *fseeko*( ) functions shall fail if, either the *stream* is unbuffered or the *stream*'s
14645 CX buffer needed to be flushed, and the call to *fseek*( ) or *fseeko*( ) causes an underlying *lseek*( ) or
14646 *write*( ) to be invoked:
```

14647 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor and the process would be delayed in the write operation.

14649 CX [EBADF] The file descriptor underlying the stream file is not open for writing or the stream's buffer needed to be flushed and the file is not open.

14651 CX [EFBIG] An attempt was made to write a file that exceeds the maximum file size.

14652 XSI [EFBIG] An attempt was made to write a file that exceeds the process' file size limit.

14653 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the offset maximum associated with the corresponding stream.

14655 CX [EINTR] The write operation was terminated due to the receipt of a signal, and no data was transferred.

14657 CX [EINVAL] The *whence* argument is invalid. The resulting file-position indicator would be set to a negative value.

14659 CX [EIO] A physical I/O error has occurred, or the process is a member of a background process group attempting to perform a *write*() to its controlling terminal, TOSTOP is set, the process is neither ignoring nor blocking SIGTTOU, and the process group of the process is orphaned. This error may also be returned under implementation-defined conditions.

14664 CX [ENOSPC] There was no free space remaining on the device containing the file.

14665 CX [EOVERFLOW] For *fseek*(), the resulting file offset would be a value which cannot be represented correctly in an object of type **long**.

14667 CX [EOVERFLOW] For *fseeko*(), the resulting file offset would be a value which cannot be represented correctly in an object of type **off_t**.

14669 CX [EPIPE] The file descriptor underlying *stream* is associated with a pipe or FIFO.

14670 CX [EPIPE] An attempt was made to write to a pipe or FIFO that is not open for reading by any process; a SIGPIPE signal shall also be sent to the thread.

14672 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the capabilities of the device.

14674 **EXAMPLES**

14675 None.

14676 **APPLICATION USAGE**

14677 None.

14678 **RATIONALE**

14679 None.

14680 **FUTURE DIRECTIONS**

14681 None.

14682 **SEE ALSO**

14683 *fopen*(), *fsetpos*(), *ftell*(), *getrlimit*(), *rewind*(), *ulimit*(), *ungetc*(), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdio.h>**

14685 **CHANGE HISTORY**

14686 First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

In the DESCRIPTION, the words ‘‘The *seek*( ) function does not, by itself, extend the size of a file’’ are deleted.

In the RETURN VALUE section, the value –1 is marked as an extension. This is because the ISO POSIX-1 standard only requires that a non-zero value is returned.

In the ERRORS section, text is added to indicate that error returns are only generated when either the stream is unbuffered, or if the stream buffer needs to be flushed.

The ‘‘fail’’ and ‘‘may fail’’ parts of the ERRORS section are revised for consistency with *lseek*( ) and *write*( ).

Text associated with the [EIO] error is expanded and the [ENXIO] error is added.

Text is added to explain how *fseek*( ) is used with wide-character input/output; this is marked as a WP extension.

The [EFBIG] error is marked to show extensions.

The APPLICATION USAGE section is added.

The following change is incorporated for alignment with the ISO C standard:

- The type of argument *offset* is now defined in full as **long** instead of **long**.

The following change is incorporated for alignment with the FIPS requirements:

- The [EINTR] error is no longer an indication that the implementation does not report partial transfers.

Issue 4, Version 2

In the ERRORS section, the description of [EIO] is updated to include the case where a physical I/O error occurs.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are now marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The *fseeko*( ) function is added.
- The [EFBIG], [EOVERFLOW], and [ENXIO] mandatory error conditions are added.

The following change is incorporated for alignment with the FIPS requirements:

- The [EINTR] error is no longer an indication that the implementation does not report partial transfers.

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

The DESCRIPTION is updated to explicitly state that *fseek*( ) sets the file-position indicator, and then on error the error indicator is set and *fseek*( ) fails. This is for alignment with the ISO/IEC 9899:1999 standard.

14726 **NAME**

14727 fsetpos — set current file position

14728 **SYNOPSIS**

14729 `#include <stdio.h>`

14730 `int fsetpos(FILE *stream, const fpos_t *pos);`

14731 **DESCRIPTION**

14732 CX The functionality described on this reference page is aligned with the ISO C standard. Any
14733 conflict between the requirements described here and the ISO C standard is unintentional. This
14734 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

14735 The *fsetpos*( ) function shall set the file position and state indicators for the stream pointed to by
14736 *stream* according to the value of the object pointed to by *pos*, which the application shall ensure
14737 is a value obtained from an earlier call to *fgetpos*( ) on the same stream. If a read or write error |
14738 occurs, the error indicator for the stream shall be set and *fsetpos*( ) fails. |

14739 A successful call to the *fsetpos*( ) function shall clear the end-of-file indicator for the stream and
14740 undo any effects of *ungetc*( ) on the same stream. After an *fsetpos*( ) call, the next operation on an
14741 update stream may be either input or output. |

14742 CX The behavior of *fsetpos*( ) on devices which are incapable of seeking is implementation-defined. |
14743 The value of the file offset associated with such a device is undefined. |

14744 **RETURN VALUE**

14745 The *fsetpos*( ) function shall return 0 if it succeeds; otherwise, it shall return a non-zero value and
14746 set *errno* to indicate the error.

14747 **ERRORS**

14748 The *fsetpos*( ) function may fail if:

14749 CX [EBADF] The file descriptor underlying *stream* is not valid. |

14750 CX [ESPIPE] The file descriptor underlying *stream* is associated with a pipe, FIFO, or socket. |

14751

14752 **EXAMPLES**

14753 None.

14754 **APPLICATION USAGE**

14755 None.

14756 **RATIONALE**

14757 None.

14758 **FUTURE DIRECTIONS**

14759 None.

14763 **CHANGE HISTORY**

14764 First released in Issue 4. Derived from the ISO C standard. |

14765 **Issue 6**

14766 Extensions beyond the ISO C standard are now marked.

14767 An additional [ESPIPE] error condition is added for sockets.

14768 The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements. |

14769 The DESCRIPTION is updated to clarify that the error indicator is set for the stream on a read or |
14770 write error. This is for alignment with the ISO/IEC 9899:1999 standard. |

14771 **NAME**

14772 fstat — get file status

14773 **SYNOPSIS**

14774 `#include <sys/stat.h>`

14775 `int fstat(int fildes, struct stat *buf);`

14776 **DESCRIPTION**

14777 The *fstat*( ) function obtains information about an open file associated with the file descriptor
14778 *fildes*, and writes it to the area pointed to by *buf*.

14779 SHM If *fildes* references a shared memory object, the implementation need update in the **stat** structure
14780 pointed to by the *buf* argument only the *st_uid*, *st_gid*, *st_size*, and *st_mode* fields, and only the
14781 S_IRUSR, S_IWUSR, S_IRGRP, S_IWGRP, S_IROTH, and S_IWOTH file permission bits need be
14782 valid.

14783 TYM If *fildes* references a typed memory object, the implementation need update in the **stat** structure
14784 pointed to by the *buf* argument only the *st_uid*, *st_gid*, *st_size*, and *st_mode* fields, and only the
14785 S_IRUSR, S_IWUSR, S_IRGRP, S_IWGRP, S_IROTH, and S_IWOTH file permission bits need be
14786 valid.

14787 The *buf* argument is a pointer to a **stat** structure, as defined in **<sys/stat.h>**, into which
14788 information is placed concerning the file.

14789 The structure members *st_mode*, *st_ino*, *st_dev*, *st_uid*, *st_gid*, *st_atime*, *st_ctime*, and *st_mtime*
14790 shall have meaningful values for all file types defined in this volume of IEEE Std. 1003.1-200x.
14791 The value of the member *st_nlink* shall be set to the number of links to the file.

14792 An implementation that provides additional or alternative file access control mechanisms may, |
14793 under implementation-defined conditions, cause *fstat*( ) to fail. |

14794 The *fstat*( ) function updates any time-related fields as described in **File Times Update** (see the |
14795 Base Definitions volume of IEEE Std. 1003.1-200x, Chapter 6, Character Set), before writing into |
14796 the **stat** structure. |

14797 **RETURN VALUE**

14798 Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to
14799 indicate the error.

14800 **ERRORS**

14801 The *fstat*( ) function shall fail if:

14802 [EBADF] The *fildes* argument is not a valid file descriptor. |

14803 [EIO] An I/O error occurred while reading from the file system. |

14804 [EOVERFLOW] The file size in bytes or the number of blocks allocated to the file or the file |
14805 serial number cannot be represented correctly in the structure pointed to by
14806 *buf*. |

14807 The *fstat*( ) function may fail if:

14808 [EOVERFLOW] One of the values is too large to store into the structure pointed to by the *buf* |
14809 argument. |

EXAMPLES

Obtaining File Status Information

The following example shows how to obtain file status information for a file named **/home/cnd/mod1**. The structure variable *buffer* is defined for the **stat** structure. The **/home/cnd/mod1** file is opened with read/write privileges and is passed to the open file descriptor *fildes*.

```
#include <sys/types.h>
#include <sys/stat.h>
#include <fcntl.h>

struct stat buffer;
int         status;
...
fildes = open("/home/cnd/mod1", O_RDWR);
status = fstat(fildes, &buffer);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

lstat( ), *stat*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<sys/stat.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The **<sys/types.h>** header is now marked as optional (OH); this header need not be included on XSI-conformant systems.

The following changes are incorporated in the DESCRIPTION for alignment with the ISO POSIX-1 standard:

- A paragraph defining the contents of **stat** structure members is added.
- The words ‘‘extended security controls’’ are replaced by ‘‘additional or alternative file access control mechanisms’’.

Issue 4, Version 2

The ERRORS section is updated for X/OPEN UNIX conformance as follows:

- The [EIO] error is added as a mandatory error indicated the occurrence of an I/O error.
- The [EOVERFLOW] error is added as an optional error indicating that one of the values is too large to store in the area pointed to by *buf*.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

Large File Summit extensions are added.

Issue 6

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [EIO] mandatory error condition is added.
- The [EOVERFLOW] mandatory error condition is added. This change is to support large files.
- The [EOVERFLOW] optional error condition is added.

The DESCRIPTION is updated for alignment with IEEE Std. 1003.1j-2000 by specifying that shared memory object semantics apply to typed memory objects.

14863 **NAME**

14864 fstatvfs, statvfs — get file system information

14865 **SYNOPSIS**

14866 XSI
```
#include <sys/statvfs.h>

int fstatvfs(int fildes, struct statvfs *buf);
int statvfs(const char *restrict path, struct statvfs *restrict buf);
```

14869

14870 **DESCRIPTION**

14871 The *fstatvfs*( ) function obtains information about the file system containing the file referenced by
14872 *fildes*.

14873 The following flags can be returned in the *f_flag* member:

14874 ST_RDONLY Read-only file system.

14875 ST_NOSUID Setuid/setgid bits ignored by *exec*.

14876 The *statvfs*( ) function obtains descriptive information about the file system containing the file
14877 named by *path*.

14878 For both functions, the *buf* argument is a pointer to a **statvfs** structure that shall be filled. Read,
14879 write, or execute permission of the named file is not required.

14880 It is unspecified whether all members of the **statvfs** structure have meaningful values on all file
14881 systems.

14882 **RETURN VALUE**

14883 Upon successful completion, *statvfs*( ) shall return 0. Otherwise, it shall return –1 and set *errno* to
14884 indicate the error.

14885 **ERRORS**

14886 The *fstatvfs*( ) and *statvfs*( ) functions shall fail if:

14887 [EIO] An I/O error occurred while reading the file system.

14888 [EINTR] A signal was caught during execution of the function.

14889 [EOVERFLOW] One of the values to be returned cannot be represented correctly in the
14890 structure pointed to by *buf*.

14891 The *fstatvfs*( ) function shall fail if:

14892 [EBADF] The *fildes* argument is not an open file descriptor.

14893 The *statvfs*( ) function shall fail if:

14894 [EACCES] Search permission is denied on a component of the path prefix.

14895 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
14896 argument.

14897 [ENAMETOOLONG]
14898 The length of a path name exceeds {PATH_MAX} or a path name component
14899 is longer than {NAME_MAX}.

14900 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

14901 [ENOTDIR] A component of the path prefix of *path* is not a directory.

14902 The *statvfs*( ) function may fail if:

14903 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during |
14904 resolution of the *path* argument. |

14905 [ENAMETOOLONG] |
14906 Path name resolution of a symbolic link produced an intermediate result
14907 whose length exceeds {PATH_MAX}.

14908 **EXAMPLES**

14909 **Obtaining File System Information Using fstatvfs()**

14910 The following example shows how to obtain file system information for the file system upon
14911 which the file named **/home/cnd/mod1** resides, using the *fstatvfs*() function. The
14912 **/home/cnd/mod1** file is opened with read/write privileges and the open file descriptor is passed
14913 to the *fstatvfs*() function.

```
14914 #include <statvfs.h>
14915 #include <fcntl.h>

14916 struct statvfs buffer;
14917 int            status;
14918 ...
14919 fildes = open("/home/cnd/mod1", O_RDWR);
14920 status  = fstatvfs(fildes, &buffer);
```

14921 **Obtaining File System Information Using statvfs()**

14922 The following example shows how to obtain file system information for the file system upon
14923 which the file named **/home/cnd/mod1** resides, using the *statvfs*() function.

```
14924 #include <statvfs.h>

14925 struct statvfs buffer;
14926 int            status;
14927 ...
14928 status = statvfs("/home/cnd/mod1", &buffer);
```

14929 **APPLICATION USAGE**
14930 None.

14931 **RATIONALE**
14932 None.

14933 **FUTURE DIRECTIONS**
14934 None.

14935 **SEE ALSO**
14936 *chmod*(), *chown*(), *creat*(), *dup*(), *exec*, *fcntl*(), *link*(), *mknod*(), *open*(), *pipe*(), *read*(), *time*(),
14937 *unlink*(), *utime*(), *write*(), the Base Definitions volume of IEEE Std. 1003.1-200x, **<sys/statvfs.h>** |

14938 **CHANGE HISTORY**
14939 First released in Issue 4, Version 2.

14940 **Issue 5**
14941 Moved from X/OPEN UNIX extension to BASE.

14942 Large File Summit extensions are added.

Issue 6

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

The **restrict** keyword is added to the *statvfs*() prototype for alignment with the ISO/IEC 9899:1999 standard.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

14949 **NAME**

14950 fsync — synchronize changes to a file

14951 **SYNOPSIS**

14952 FSC
```
#include <unistd.h>
```

14953
```
int fsync(int fildes);
```

14954

14955 **DESCRIPTION**

14956 The *fsync*( ) function can be used by an application to indicate that all data for the open file
14957 description named by *fildes* is to be transferred to the storage device associated with the file
14958 described by *fildes* in an implementation-defined manner. The *fsync*( ) function shall not return |
14959 until the system has completed that action or until an error is detected.

14960 SIO If _POSIX_SYNCHRONIZED_IO is defined, the *fsync*( ) function shall force all currently queued
14961 I/O operations associated with the file indicated by file descriptor *fildes* to the synchronized I/O
14962 completion state. All I/O operations shall be completed as defined for synchronized I/O file
14963 integrity completion.

14964 **RETURN VALUE**

14965 Upon successful completion, *fsync*( ) shall return 0. Otherwise, –1 shall be returned and *errno* set
14966 to indicate the error. If the *fsync*( ) function fails, outstanding I/O operations are not guaranteed
14967 to have been completed.

14968 **ERRORS**

14969 The *fsync*( ) function shall fail if:

14970 [EBADF] The *fildes* argument is not a valid descriptor. |

14971 [EINTR] The *fsync*( ) function was interrupted by a signal. |

14972 [EINVAL] The *fildes* argument does not refer to a file on which this operation is possible. |

14973 [EIO] An I/O error occurred while reading from or writing to the file system. |

14974 In the event that any of the queued I/O operations fail, *fsync*( ) shall return the error conditions
14975 defined for *read*( ) and *write*( ).

14976 **EXAMPLES**

14977 None.

14978 **APPLICATION USAGE**

14979 The *fsync*( ) function should be used by programs which require modifications to a file to be
14980 completed before continuing; for example, a program which contains a simple transaction
14981 facility might use it to ensure that all modifications to a file or files caused by a transaction are
14982 recorded.

14983 **RATIONALE**

14984 The *fsync*( ) function is intended to force a physical write of data from the buffer cache, and to
14985 assure that after a system crash or other failure that all data up to the time of the *fsync*( ) call is
14986 recorded on the disk. Since the concepts of ‘‘buffer cache’’, ‘‘system crash’’, ‘‘physical write’’, and
14987 ‘‘non-volatile storage’’ are not defined here, the wording has to be more abstract.

14988 If _POSIX_SYNCHRONIZED_IO is not defined, the wording relies heavily on the conformance
14989 document to tell the user what can be expected from the system. It is explicitly intended that a
14990 null implementation is permitted. This could be valid in the case where the system cannot assure
14991 non-volatile storage under any circumstances or when the system is highly fault-tolerant and the
14992 functionality is not required. In the middle ground between these extremes, *fsync*( ) might or
14993 might not actually cause data to be written where it is safe from a power failure. The

conformance document should identify at least that one configuration exists (and how to obtain that configuration) where this can be assured for at least some files that the user can select to use for critical data. It is not intended that an exhaustive list is required, but rather sufficient information is provided to let the user determine that if he or she has critical data he or she can configure her system to allow it to be written to non-volatile storage.

It is reasonable to assert that the key aspects of *fsync*( ) are unreasonable to test in a test suite. That does not make the function any less valuable, just more difficult to test. A formal conformance test should probably force a system crash (power shutdown) during the test for this condition, but it needs to be done in such a way that automated testing does not require this to be done except when a formal record of the results is being made. It would also not be unreasonable to omit testing for *fsync*( ), allowing it to be treated as a quality-of-implementation issue.

FUTURE DIRECTIONS

None.

SEE ALSO

sync( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<unistd.h>**

CHANGE HISTORY

First released in Issue 3.

Issue 4

The **<unistd.h>** header is added to the SYNOPSIS section.

In the APPLICATION USAGE section, the words ‘‘require a file to be in a known state’’ are replaced by ‘‘require modifications to a file to be completed before continuing’’.

Issue 5

Aligned with *fsync*( ) in the POSIX Realtime Extension. Specifically, the DESCRIPTION and RETURN VALUE sections are much expanded, and the ERRORS section is updated to indicate that *fsync*( ) can return the error conditions defined for *read*( ) and *write*( ).

Issue 6

This function is marked as part of the File Synchronization option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EINVAL] and [EIO] mandatory error conditions are added.

15025 **NAME**

15026 ftell, ftello — return a file offset in a stream

15027 **SYNOPSIS**

15028 `#include <stdio.h>`

15029 `long ftell(FILE *stream);` |

15030 CX `off_t ftello(FILE *stream);` |

15031

15032 **DESCRIPTION**

15033 CX The functionality described on this reference page is aligned with the ISO C standard. Any
15034 conflict between the requirements described here and the ISO C standard is unintentional. This
15035 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

15036 The *ftell*( ) function shall obtain the current value of the file-position indicator for the stream
15037 pointed to by *stream*.

15038 CX The *ftello*( ) function is identical to *ftell*( ) except that the return value is of type **off_t**.

15039 **RETURN VALUE**

15040 CX Upon successful completion, *ftell*( ) and *ftello*( ) shall return the current value of the file-position
15041 indicator for the stream measured in bytes from the beginning of the file.

15042 CX Otherwise, *ftell*( ) and *ftello*( ) shall return –1, cast to **long** and **off_t** respectively, and set *errno* to
15043 indicate the error.

15044 **ERRORS**

15045 CX The *ftell*( ) and *ftello*( ) functions shall fail if:

15046 CX [EBADF] The file descriptor underlying *stream* is not an open file descriptor. |

15047 CX [EOVERFLOW] For *ftell*( ), the current file offset cannot be represented correctly in an object of |
15048 type **long**.

15049 CX [EOVERFLOW] For *ftello*( ), the current file offset cannot be represented correctly in an object |
15050 of type **off_t**.

15051 CX [ESPIPE] The file descriptor underlying *stream* is associated with a pipe or FIFO. |

15052 The *ftell*( ) function may fail if:

15053 CX [ESPIPE] The file descriptor underlying *stream* is associated with a socket.

15054 **EXAMPLES**

15055 None.

15056 **APPLICATION USAGE**

15057 None.

15058 **RATIONALE**

15059 None.

15060 **FUTURE DIRECTIONS**

15061 None.

15062 **SEE ALSO**

15063 *fgetpos*( ), *fopen*( ), *fseek*( ), *lseek*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdio.h>** |

15064 **CHANGE HISTORY**

15065 First released in Issue 1. Derived from Issue 1 of the SVID.

15066 **Issue 4**

15067 The following change is incorporated for alignment with the ISO C standard:

15068 • The function return value is now defined in full as **long**. It was previously defined as **long**.

15069 **Issue 5**

15070 Large File Summit extensions are added.

15071 **Issue 6**

15072 Extensions beyond the ISO C standard are now marked.

15073 The following new requirements on POSIX implementations derive from alignment with the
15074 Single UNIX Specification:

15075 • The *ftello*( ) function is added.

15076 • The [EOVERFLOW] error conditions are added.

15077 An additional [ESPIPE] error condition is added for sockets.

15078 **NAME**

15079 ftime — get date and time (**LEGACY**)

15080 **SYNOPSIS**

15081 XSI
```
#include <sys/timeb.h>
```
15082
```
int ftime(struct timeb *tp);
```
15083

15084 **DESCRIPTION**

15085 The *ftime*( ) function shall set the *time* and *millitm* members of the **timeb** structure pointed to by
15086 *tp* to contain the seconds and milliseconds portions, respectively, of the current time in seconds
15087 since the Epoch. The contents of the *timezone* and *dstflag* members of *tp* after a call to *ftime*( ) are
15088 unspecified.

15089 The system clock need not have millisecond granularity. Depending on any granularity
15090 (particularly a granularity of one) renders code non-portable.

15091 **RETURN VALUE**

15092 Upon successful completion, the *ftime*( ) function shall return 0; otherwise, –1 shall be returned.

15093 **ERRORS**

15094 No errors are defined.

15095 **EXAMPLES**

15096 **Getting the Current Time and Date**

15097 The following example shows how to get the current system time values using the *ftime*( )
15098 function. The **timeb** structure pointed to by *tp* is filled with the current system time values for
15099 *time* and *millitm*.

15100
```
#include <sys/timeb.h>
```
15101
```
struct timeb tp;
```
15102
```
int          status;
```
15103
```
...
```
15104
```
status = ftime(&tp);
```

15105 **APPLICATION USAGE**

15106 For applications portability, the *time*( ) function should be used to determine the current time
15107 instead of *ftime*( ).

15108 **RATIONALE**

15109 None.

15110 **FUTURE DIRECTIONS**

15111 This function may be withdrawn in a future version.

15112 **SEE ALSO**

15113 *ctime*( ), *gettimeofday*( ), *time*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, |
15114 **<sys/timeb.h>**

15115 **CHANGE HISTORY**

15116 First released in Issue 4, Version 2.

15117 **Issue 5**

15118 Moved from X/OPEN UNIX extension to BASE.

15119 Normative text previously in the APPLICATION USAGE section is moved to the
15120 DESCRIPTION.

Issue 6

This function is marked LEGACY.

The DESCRIPTION is updated to refer to ‘‘seconds since the Epoch’’ rather than ‘‘seconds since 00:00:00 UTC (Coordinated Universal Time), January 1 1970’’ for consistency with other *time* functions.

15126 **NAME**

15127 ftok — generate an IPC key

15128 **SYNOPSIS**

15129 XSI
```
#include <sys/ipc.h>
```

15130
```
key_t ftok(const char *path, int id);
```

15131

15132 **DESCRIPTION**

15133 The *ftok*( ) function shall return a key based on *path* and *id* that is usable in subsequent calls to
15134 *msgget*( ), *semget*( ), and *shmget*( ). The application shall ensure that the *path* argument is the path
15135 name of an existing file that the process is able to *stat*( ).

15136 The *ftok*( ) function shall return the same key value for all paths that name the same file, when
15137 called with the same *id* value, and return different key values when called with different *id*
15138 values or with paths that name different files existing on the same file system at the same time. It
15139 is unspecified whether *ftok*( ) shall return the same key value when called again after the file
15140 named by *path* is removed and recreated with the same name.

15141 Only the low order 8-bits of *id* are significant. The behavior of *ftok*( ) is unspecified if these bits
15142 are 0.

15143 **RETURN VALUE**

15144 Upon successful completion, *ftok*( ) shall return a key. Otherwise, *ftok*( ) shall return (**key_t**)–1
15145 and set *errno* to indicate the error.

15146 **ERRORS**

15147 The *ftok*( ) function shall fail if:

15148 [EACCES] Search permission is denied for a component of the path prefix. |

15149 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path* |
15150 argument. |

15151 [ENAMETOOLONG] |
15152 The length of the *path* argument exceeds {PATH_MAX} or a path name
15153 component is longer than {NAME_MAX}.

15154 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string. |

15155 [ENOTDIR] A component of the path prefix is not a directory. |

15156 The *ftok*( ) function may fail if:

15157 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during |
15158 resolution of the *path* argument. |

15159 [ENAMETOOLONG] |
15160 Path name resolution of a symbolic link produced an intermediate result
15161 whose length exceeds {PATH_MAX}.

EXAMPLES

Getting an IPC Key

The following example gets a unique key that can be used by the IPC functions *semget*( ), *msgget*( ), and *shmget*( ). The key returned by *ftok*( ) for this example is based on the ID value *S* and the path name **/tmp**.

```
#include <sys/ipc.h>
...
key_t key;
char *path = "/tmp";
int id = 'S';

key = ftok(path, id);
```

Saving an IPC Key

The following example gets a unique key based on the path name **/tmp** and the ID value *a*. It also assigns the value of the resulting key to the *semkey* variable so that it will be available to a later call to *semget*( ), *msgget*( ), or *shmget*( ).

```
#include <sys/ipc.h>
...
key_t semkey;

if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
    perror("IPC error: ftok"); exit(1);
}
```

APPLICATION USAGE

For maximum portability, *id* should be a single-byte character.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

15199 **NAME**

15200 ftruncate — truncate a file to a specified length

15201 **SYNOPSIS**

15202 `#include <unistd.h>`

15203 `int ftruncate(int` *`fildes`*`, off_t` *`length`*`);`

15204 **DESCRIPTION**

15205 If *fildes* is not a valid file descriptor open for writing, the *ftruncate*( ) function shall fail.

15206 If *fildes* refers to a regular file, the *ftruncate*( ) function shall cause the size of the file to be
15207 truncated to *length*. If the size of the file previously exceeded *length*, the extra data shall no
15208 longer be available to reads on the file. If the file previously was smaller than this size,
15209 XSI *ftruncate*( ) shall either increase the size of the file or fail. XSI-conformant systems shall increase
15210 the size of the file. If the file size is increased, the extended area shall appear as if it were zero-
15211 filled. The value of the seek pointer shall not be modified by a call to *ftruncate*( ).

15212 Upon successful completion, if *fildes* refers to a regular file, the *ftruncate*( ) function shall mark
15213 for update the *st_ctime* and *st_mtime* fields of the file and the S_ISUID and S_ISGID bits of the file
15214 mode may be cleared. If the *ftruncate*( ) function is unsuccessful, the file is unaffected.

15215 XSI If the request would cause the file size to exceed the soft file size limit for the process, the
15216 request shall fail and the implementation shall generate the SIGXFSZ signal for the process.

15217 If *fildes* refers to a directory, *ftruncate*( ) shall fail.

15218 If *fildes* refers to any other file type, except a shared memory object, the result is unspecified.

15219 SHM If *fildes* refers to a shared memory object, *ftruncate*( ) shall set the size of the shared memory
15220 object to *length*.

15221 MF|SHM If the effect of *ftruncate*( ) is to decrease the size of a shared memory object or memory mapped
15222 file and whole pages beyond the new end were previously mapped, then the whole pages
15223 beyond the new end shall be discarded.

15224 MPR If the Memory Protection option is supported, references to discarded pages shall result in the
15225 generation of a SIGBUS signal; otherwise, the result of such references is undefined.

15226 MF|SHM If the effect of *ftruncate*( ) is to increase the size of a shared memory object, it is unspecified if the
15227 contents of any mapped pages between the old end-of-file and the new are flushed to the
15228 underlying object.

15229 **RETURN VALUE**

15230 Upon successful completion, *ftruncate*( ) shall return 0; otherwise, –1 shall be returned and *errno*
15231 set to indicate the error.

15232 **ERRORS**

15233 The *ftruncate*( ) function shall fail if:

15234 [EINTR] A signal was caught during execution.

15235 [EINVAL] The *length* argument was less than 0.

15236 [EFBIG] or [EINVAL]
15237 The *length* argument was greater than the maximum file size.

15238 XSI [EFBIG] The file is a regular file and *length* is greater than the offset maximum
15239 established in the open file description associated with *fildes*.

15240 [EIO] An I/O error occurred while reading from or writing to a file system.

15241 [EBADF] or [EINVAL] |
15242 The *fildes* argument is not a file descriptor open for writing.

15243 [EINVAL] The *fildes* argument references a file that was opened without write |
15244 permission.

15245 [EROFS] The named file resides on a read-only file system. |

15246 **EXAMPLES**

15247 None.

15248 **APPLICATION USAGE**

15249 None.

15250 **RATIONALE**

15251 The *ftruncate*( ) function is part of IEEE Std. 1003.1-200x as it was deemed to be more useful than |
15252 *truncate*( ). The *truncate*( ) function is provided as an XSI extension.

15253 **FUTURE DIRECTIONS**

15254 None.

15255 **SEE ALSO**

15256 *open*( ), *truncate*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<unistd.h>** |

15257 **CHANGE HISTORY**

15258 First released in Issue 4, Version 2.

15259 **Issue 5**

15260 Moved from X/OPEN UNIX extension to BASE and aligned with *ftruncate*( ) in the POSIX
15261 Realtime Extension. Specifically, the DESCRIPTION is extensively reworded and [EROFS] is
15262 added to the list of mandatory errors that can be returned by *ftruncate*( ).

15263 Large File Summit extensions are added.

15264 **Issue 6**

15265 The *truncate*( ) function has been split out into a separate reference page.

15266 The following new requirements on POSIX implementations derive from alignment with the |
15267 Single UNIX Specification:

15268 • The DESCRIPTION is change to indicate that if the file size is changed, and if the file is a
15269 regular file, the S_ISUID and S_ISGID bits in the file mode may be cleared.

15270 The following changes were made to align with the IEEE P1003.1a draft standard:

15271 • The DESCRIPTION text is updated.

15272 XSI-conformant systems are required to increase the size of the file if the file was previously |
15273 smaller than the size requested. |

15274 **NAME**

15275 ftrylockfile — stdio locking functions

15276 **SYNOPSIS**

15277 TSF
```
#include <stdio.h>
```

15278
```
int ftrylockfile(FILE *file);
```

15279

15280 **DESCRIPTION**

15281 Refer to *flockfile* ( ).

NAME

ftw — traverse (walk) a file tree

SYNOPSIS

XSI
```
#include <ftw.h>

int ftw(const char *path, int (*fn)(const char *,
    const struct stat *ptr, int flag), int ndirs);
```

DESCRIPTION

The *ftw*( ) function recursively descends the directory hierarchy rooted in *path*. For each object in the hierarchy, *ftw*( ) shall call the function pointed to by *fn*, passing it a pointer to a null-terminated character string containing the name of the object, a pointer to a **stat** structure containing information about the object, and an integer. Possible values of the integer, defined in the **<ftw.h>** header, are:

FTW_D — For a directory.

FTW_DNR — For a directory that cannot be read.

FTW_F — For a file.

FTW_SL — For a symbolic link (but see also FTW_NS below).

FTW_NS — For an object other than a symbolic link on which *stat*( ) could not successfully be executed. If the object is a symbolic link and *stat*( ) failed, it is unspecified whether *ftw*( ) passes FTW_SL or FTW_NS to the user-supplied function.

If the integer is FTW_DNR, descendants of that directory shall not be processed. If the integer is FTW_NS, the **stat** structure contains undefined values. An example of an object that would cause FTW_NS to be passed to the function pointed to by *fn* would be a file in a directory with read but without execute (search) permission.

The *ftw*( ) function shall visit a directory before visiting any of its descendants.

The *ftw*( ) function shall use at most one file descriptor for each level in the tree.

The argument *ndirs* should be in the range of 1 to {OPEN_MAX}.

The tree traversal shall continue until the tree is exhausted, an invocation of *fn* returns a non-zero value, or some error, other than [EACCES], is detected within *ftw*( ).

The *ndirs* argument shall specify the maximum number of directory streams or file descriptors or both available for use by *ftw*( ) while traversing the tree. When *ftw*( ) returns it shall close any directory streams and file descriptors it uses not counting any opened by the application-supplied *fn* function.

RETURN VALUE

If the tree is exhausted, *ftw*( ) shall return 0. If the function pointed to by *fn* returns a non-zero value, *ftw*( ) shall stop its tree traversal and return whatever value was returned by the function pointed to by *fn*. If *ftw*( ) detects an error, it shall return –1 and set *errno* to indicate the error.

If *ftw*( ) encounters an error other than [EACCES] (see FTW_DNR and FTW_NS above), it shall return –1 and set *errno* to indicate the error. The external variable *errno* may contain any error value that is possible when a directory is opened or when one of the *stat* functions is executed on a directory or file.

15323 **ERRORS**

15324 The *ftw*( ) function shall fail if:

15325 [EACCES] Search permission is denied for any component of *path* or read permission is
15326 denied for *path*.

15327 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
15328 argument.

15329 [ENAMETOOLONG]
15330 The length of the *path* argument exceeds {PATH_MAX} or a path name
15331 component is longer than {NAME_MAX}.

15332 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

15333 [ENOTDIR] A component of *path* is not a directory.

15334 The *ftw*( ) function may fail if:

15335 [EINVAL] The value of the *ndirs* argument is invalid.

15336 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
15337 resolution of the *path* argument.

15338 [ENAMETOOLONG]
15339 Path name resolution of a symbolic link produced an intermediate result
15340 whose length exceeds {PATH_MAX}.

15341 In addition, if the function pointed to by *fn* encounters system errors, *errno* may be set
15342 accordingly.

15343 **EXAMPLES**

15344 **Walking a Directory Structure**

15345 The following example walks the current directory structure, calling the *fn* function for every
15346 directory entry, using at most 10 file descriptors:

```
15347 #include <ftw.h>
15348 ...
15349 if (ftw(".", fn, 10) != 0) {
15350     perror("ftw"); exit(2);
15351 }
```

15352 **APPLICATION USAGE**

15353 The *ftw*( ) function may allocate dynamic storage during its operation. If *ftw*( ) is forcibly
15354 terminated, such as by *longjmp*( ) or *siglongjmp*( ) being executed by the function pointed to by *fn*
15355 or an interrupt routine, *ftw*( ) does not have a chance to free that storage, so it remains
15356 permanently allocated. A safe way to handle interrupts is to store the fact that an interrupt has
15357 occurred, and arrange to have the function pointed to by *fn* return a non-zero value at its next
15358 invocation.

15359 **RATIONALE**

15360 None.

15361 **FUTURE DIRECTIONS**

15362 None.

15363 **SEE ALSO**

15364 *longjmp*( ), *lstat*( ), *malloc*( ), *nftw*( ), *opendir*( ), *siglongjmp*( ), *stat*( ), the Base Definitions volume of |
15365 IEEE Std. 1003.1-200x, **<ftw.h>**, **<sys/stat.h>** |

15366 **CHANGE HISTORY**

15367 First released in Issue 1. Derived from Issue 1 of the SVID. |

15368 **Issue 4**

15369 The type of argument *path* is changed from **char*** to **const char***. The argument list for *fn* has
15370 also been defined.

15371 In the DESCRIPTION, the words ‘‘other than [EACCES]’’ are added to the paragraph describing
15372 termination conditions for tree traversal.

15373 The following change is incorporated for alignment with the FIPS requirements:

15374 • In the ERRORS section, the condition whereby [ENAMETOOLONG] is returned if a path
15375 name component is larger that {NAME_MAX} is now defined as mandatory and marked as
15376 an extension.

15377 **Issue 4, Version 2**

15378 The following changes are incorporated for X/OPEN UNIX conformance:

15379 • The DESCRIPTION is updated to describe the use of the FTW_SL and FTW_NS values for a
15380 symbolic link.

15381 • The DESCRIPTION states that *ftw*( ) uses at most one file descriptor for each level in the tree.

15382 • The DESCRIPTION constrains *ndirs* to the range from 1 to {OPEN_MAX}.

15383 • The RETURN VALUE section is updated to describe the case where *ftw*( ) encounters an error
15384 other than [EACCES].

15385 • In the ERRORS section, a second [ENAMETOOLONG] condition is defined that may report
15386 excessive length of an intermediate result of path name resolution of a symbolic link.

15387 **Issue 5**

15388 UX codings in the DESCRIPTION, RETURN VALUE, and ERRORS sections have been changed
15389 to EX.

15390 **Issue 6**

15391 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

15392 • The [ENAMETOOLONG] error is restored as an error dependent on _POSIX_NO_TRUNC.
15393 This is since behavior may vary from one file system to another.

15394 The wording of the mandatory [ELOOP] error condition is updated, and a second optional |
15395 [ELOOP] error condition is added. |

15396 **NAME**

15397 funlockfile — stdio locking functions

15398 **SYNOPSIS**

15399 TSF
```
#include <stdio.h>
```

15400
```
void funlockfile(FILE *file);
```

15401

15402 **DESCRIPTION**

15403 Refer to *flockfile* ( ).

15404 **NAME**

15405 fwide — set stream orientation

15406 **SYNOPSIS**

15407 `#include <stdio.h>`

15408 `#include <wchar.h>`

15409 `int fwide(FILE *stream, int mode);`

15410 **DESCRIPTION**

15411 CX The functionality described on this reference page is aligned with the ISO C standard. Any
15412 conflict between the requirements described here and the ISO C standard is unintentional. This
15413 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

15414 The *fwide*( ) function shall determine the orientation of the stream pointed to by *stream*. If *mode* is
15415 greater than zero, the function first attempts to make the stream wide-oriented. If *mode* is less
15416 than zero, the function first attempts to make the stream byte-oriented. Otherwise, *mode* is zero
15417 and the function does not alter the orientation of the stream.

15418 If the orientation of the stream has already been determined, *fwide*( ) shall not change it.

15419 Because no return value is reserved to indicate an error, an application wishing to check for error
15420 situations should set *errno* to 0, then call *fwide*( ), then check *errno*, and if it is non-zero, assume
15421 an error has occurred.

15422 **RETURN VALUE**

15423 The *fwide*( ) function shall return a value greater than zero if, after the call, the stream has wide-
15424 orientation, a value less than zero if the stream has byte-orientation, or zero if the stream has no
15425 orientation.

15426 **ERRORS**

15427 The *fwide*( ) function may fail if:

15428 CX [EBADF] The *stream* argument is not a valid stream.

15429 **EXAMPLES**

15430 None.

15431 **APPLICATION USAGE**

15432 A call to *fwide*( ) with *mode* set to zero can be used to determine the current orientation of a
15433 stream.

15434 **RATIONALE**

15435 None.

15436 **FUTURE DIRECTIONS**

15437 None.

15438 **SEE ALSO**

15439 The Base Definitions volume of IEEE Std. 1003.1-200x, **<wchar.h>**

15440 **CHANGE HISTORY**

15441 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
15442 (E).

15443 **Issue 6**

15444 Extensions beyond the ISO C standard are now marked.

15445 **NAME**

15446 fwprintf, swprintf, wprintf — print formatted wide-character output

15447 **SYNOPSIS**

15448 ```
#include <stdio.h>
```

15449 ```
#include <wchar.h>
```

15450 ```
int fwprintf(FILE *restrict stream, const wchar_t *restrict format, ...);
```

15451 ```
int swprintf(wchar_t *restrict ws, size_t n, const wchar_t *restrict format, ...);
```

15452 ```
int wprintf(const wchar_t *restrict format, ...);
```

15453 **DESCRIPTION**

15454 CX The functionality described on this reference page is aligned with the ISO C standard. Any
15455 conflict between the requirements described here and the ISO C standard is unintentional. This
15456 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

15457 The *fwprintf*( ) function places output on the named output *stream*. The *wprintf*( ) function places
15458 output on the standard output stream *stdout*. The *swprintf*( ) function places output followed by
15459 the null wide character in consecutive wide characters starting at **ws*; no more than *n* wide
15460 characters are written, including a terminating null wide character, which is always added
15461 (unless *n* is zero).

15462 Each of these functions converts, formats, and prints its arguments under control of the *format*
15463 wide-character string. The *format* is composed of zero or more directives: *ordinary wide-*
15464 *characters*, which are simply copied to the output stream, and *conversion specifications*, each of
15465 which results in the fetching of zero or more arguments. The results are undefined if there are
15466 insufficient arguments for the *format*. If the *format* is exhausted while arguments remain, the
15467 excess arguments are evaluated but are otherwise ignored.

15468 XSI Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than
15469 to the next unused argument. In this case, the conversion wide character '%' (see below) is
15470 replaced by the sequence "%n$", where *n* is a decimal integer in the range [1,{NL_ARGMAX}],
15471 giving the position of the argument in the argument list. This feature provides for the definition
15472 of *format* wide-character strings that select arguments in an order appropriate to specific
15473 languages (see the EXAMPLES section).

15474 In *format* wide-character strings containing the "%n$" form of conversion specifications,
15475 numbered arguments in the argument list can be referenced from the *format* wide-character
15476 string as many times as required.

15477 In *format* wide-character strings containing the '%' form of conversion specifications, each
15478 argument in the argument list is used exactly once.

15479 All forms of the *fwprintf*( ) function allow for the insertion of a locale-dependent radix character
15480 in the output string, output as a wide-character value. The radix character is defined in the
15481 program's locale (category *LC_NUMERIC*). In the POSIX locale, or in a locale where the radix
15482 character is not defined, the radix character defaults to a period ('.').

15483 XSI Each conversion specification is introduced by the '%' wide character or by the wide-character
15484 sequence "%n$", after which the following appear in sequence:

15485 - Zero or more *flags* (in any order), which modify the meaning of the conversion specification.

15486 - An optional minimum *field width*. If the converted value has fewer wide characters than the
15487 field width, it shall be padded with spaces by default on the left; it shall be padded on the
15488 right, if the left-adjustment flag ('−'), described below, is given to the field width. The field
15489 width takes the form of an asterisk ('*'), described below, or a decimal integer.
```

- An optional *precision* that gives the minimum number of digits to appear for the *d*, *i*, *o*, *u*, *x*, and *X* conversions; the number of digits to appear after the radix character for the *e*, *E*, and *f* conversions; the maximum number of significant digits for the *g* and *G* conversions; or the maximum number of wide characters to be printed from a string in *s* conversions. The precision takes the form of a period (`'.'`) followed either by an asterisk (`'*'`), described below, or an optional decimal digit string, where a null digit string is treated as 0. If a precision appears with any other conversion wide character, the behavior is undefined.
- An optional length modifier that specifies the size of the argument.
- A *conversion wide character* that indicates the type of conversion to be applied.

A field width, or precision, or both, may be indicated by an asterisk (`'*'`). In this case an argument of type **int** supplies the field width or precision. The application shall ensure that arguments specifying field width, or precision, or both appear in that order before the argument, if any, to be converted. A negative field width is taken as a `'-'` flag followed by a positive field width. A negative precision is taken as if the precision were omitted. In format wide-character strings containing the `"%n$"` form of a conversion specification, a field width or precision may be indicated by the sequence `"*m$"`, where *m* is a decimal integer in the range [1,{NL_ARGMAX}] giving the position in the argument list (after the format argument) of an integer argument containing the field width or precision, for example:

```
wprintf(L"%1$d:%2$.*3$d:%4$.*3$d\n", hour, min, precision, sec);
```

The *format* can contain either numbered argument specifications (that is, `"%n$"` and `"*m$"`), or unnumbered argument specifications (that is, `'%'` and `'*'`), but normally not both. The only exception to this is that `"%%"` can be mixed with the `"%n$"` form. The results of mixing numbered and unnumbered argument specifications in a *format* wide-character string are undefined. When numbered argument specifications are used, specifying the *N*th argument requires that all the leading arguments, from the first to the (*N*–1)th, are specified in the format wide-character string.

The flag wide characters and their meanings are:

`'` The integer portion of the result of a decimal conversion (%*i*, %*d*, %*u*, %*f*, %*g*, or %*G*) shall be formatted with thousands' grouping wide characters. For other conversions, the behavior is undefined. The numeric grouping wide character is used.

– The result of the conversion shall be left-justified within the field. The conversion shall be right-justified if this flag is not specified.

+ The result of a signed conversion shall always begin with a sign (`'+'` or `'-'`). The conversion shall begin with a sign only when a negative value is converted if this flag is not specified.

<space> If the first wide character of a signed conversion is not a sign, or if a signed conversion results in no wide characters, a space shall be prefixed to the result. This means that if the <space> and `'+'` flags both appear, the space flag shall be ignored.

This flag specifies that the value is to be converted to an alternative form. For *o* conversion, it increases the precision (if necessary) to force the first digit of the result to be 0. For *x* or *X* conversions, a non-zero result ahsll have 0*x* (or 0*X*) prefixed to it. For *e*, *E*, *f*, *g*, or *G* conversions, the result shall always contain a radix character, even if no digits follow it. Without this flag, a radix character appears in the result of these conversions only if a digit follows it. For *g* and *G* conversions, trailing zeros shall *not* be removed from the result as they normally are. For other conversions, the behavior is undefined.

0 For *d*, *i*, *o*, *u*, *x*, *X*, *e*, *E*, *f*, *g*, and *G* conversions, leading zeros (following any indication of sign or base) are used to pad to the field width; no space padding is performed. If the 0 and '−' flags both appear, the 0 flag shall be ignored. For *d*, *i*, *o*, *u*, *x*, and *X* conversions, if a precision is specified, the 0 flag shall be ignored. If the 0 and ''' flags both appear, the grouping wide characters are inserted before zero padding. For other conversions, the behavior is undefined.

The length modifiers and their meanings are:

hh Specifies that a following *d*, *i*, *o*, *u*, *x*, or *X* conversion specifier applies to a **signed char** or **unsigned char** argument (the argument will have been promoted according to the integer promotions, but its value shall be converted to **signed char** or **unsigned char** before printing); or that a following *n* conversion specifier applies to a pointer to a **signed char** argument.

h Specifies that a following *d*, *i*, *o*, *u*, *x*, or *X* conversion specifier applies to a **short** or **unsigned short** argument (the argument will have been promoted according to the integer promotions, but its value shall be converted to **short** or **unsigned short** before printing); or that a following *n* conversion specifier applies to a pointer to a **short** argument.

l (ell) Specifies that a following *d*, *i*, *o*, *u*, *x*, or *X* conversion specifier applies to a **long** or **unsigned long** argument; that a following *n* conversion specifier applies to a pointer to a **long** argument; that a following *c* conversion specifier applies to a **wint_t** argument; that a following *s* conversion specifier applies to a pointer to a **wchar_t** argument; or has no effect on a following *a*, *A*, *e*, *E*, *f*, *F*, *g*, or *G* conversion specifier.

ll (ell-ell) Specifies that a following *d*, *i*, *o*, *u*, *x*, or *X* conversion specifier applies to a **long long** or **unsigned long long** argument; or that a following *n* conversion specifier applies to a pointer to a **long long** argument.

j Specifies that a following *d*, *i*, *o*, *u*, *x*, or *X* conversion specifier applies to an **intmax_t** or **uintmax_t** argument; or that a following *n* conversion specifier applies to a pointer to an **intmax_t** argument.

z Specifies that a following *d*, *i*, *o*, *u*, *x*, or *X* conversion specifier applies to a **size_t** or the corresponding signed integer type argument; or that a following *n* conversion specifier applies to a pointer to a signed integer type corresponding to **size_t** argument.

t Specifies that a following *d*, *i*, *o*, *u*, *x*, or *X* conversion specifier applies to a **ptrdiff_t** or the corresponding **unsigned** type argument; or that a following *n* conversion specifier applies to a pointer to a **ptrdiff_t** argument.

L Specifies that a following *a*, *A*, *e*, *E*, *f*, *F*, *g*, or *G* conversion specifier applies to a **long double** argument.

If a length modifier appears with any conversion specifier other than as specified above, the behavior is undefined.

The conversion wide characters and their meanings are:

d, *i* The **int** argument is converted to a signed decimal in the style **[–]***dddd*. The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision is 1. The result of converting 0 with an explicit precision of 0 is no wide characters.

o The **unsigned** argument is converted to unsigned octal format in the style *dddd*. The precision specifies the minimum number of digits to appear; if the value being

converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision is 1. The result of converting 0 with an explicit precision of 0 is no wide characters.

u The **unsigned** argument is converted to unsigned decimal format in the style *dddd*. The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision is 1. The result of converting 0 with an explicit precision of 0 is no wide characters.

x The **unsigned** argument is converted to unsigned hexadecimal format in the style *dddd*; the letters "abcdef" are used. The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision is 1. The result of converting 0 with an explicit precision of 0 is no wide characters.

X Behaves the same as the *x* conversion wide character except that letters "ABCDEF" are used instead of "abcdef".

f, F The **double** argument is converted to decimal notation in the style **[–]***ddd.ddd*, where the number of digits after the radix character is equal to the precision specification. If the precision is missing, it is taken as 6; if the precision is explicitly 0 and no '#' flag is present, no radix character appears. If a radix character appears, at least one digit appears before it. The value is rounded to the appropriate number of digits.

A **double** argument representing an infinity is converted in one of the styles [–]inf or [–]infinity; which style is implementation-defined. A **double** argument representing a NaN is converted in one of the styles [–]nan or [–]nan(*n-char-sequence*); which style, and the meaning of any *n-char-sequence*, is implementation-defined. The *F* conversion specifier produces INF, INFINITY, or NAN instead of inf, infinity, or nan, respectively.

e, E The **double** argument is converted in the style **[–]***d.ddd*±*dd*, where there is one digit before the radix character (which is non-zero if the argument is non-zero) and the number of digits after it is equal to the precision; if the precision is missing, it is taken as 6; if the precision is 0 and no '#' flag is present, no radix character appears. The value is rounded to the appropriate number of digits. The *E* conversion wide character shall produce a number with *E* instead of *e* introducing the exponent. The exponent always contains at least two digits. If the value is 0, the exponent is 0.

A **double** argument representing an infinity or NaN is converted in the style of an *f* or *F* conversion specifier.

g, G The **double** argument is converted in the style *f* or *e* (or in the style *E* in the case of a *G* conversion wide character), with the precision specifying the number of significant digits. If an explicit precision is 0, it is taken as 1. The style used depends on the value converted; style *e* (or *E*) shall be used only if the exponent resulting from such a conversion is less than –4 or greater than or equal to the precision. Trailing zeros are removed from the fractional portion of the result; a radix character appears only if it is followed by a digit.

A **double** argument representing an infinity or NaN is converted in the style of an *f* or *F* conversion specifier.

a, A A **double** argument representing a floating-point number is converted in the style [–]0xh.hhhh p1d, where there is one hexadecimal digit (which is non-zero if the argument is a normalized floating-point number and is otherwise unspecified) before the decimal-point character 235) and the number of hexadecimal digits after it is equal

15629 to the precision; if the precision is missing and FLT_RADIX is a power of 2, then the
15630 precision is sufficient for an exact representation of the value; if the precision is missing
15631 and FLT_RADIX is not a power of 2, then the precision is sufficient to distinguish 236)
15632 values of type **double**, except that trailing zeros may be omitted; if the precision is zero
15633 and the '#' flag is not specified, no decimal-point character appears. The letters
15634 "abcdef" are used for *a* conversion and the letters "ABCDEF" for *A* conversion. The *A*
15635 conversion specifier produces a number with 'X' and 'P' instead of 'x' and 'p'.
15636 The exponent always contains at least one digit, and only as many more digits as
15637 necessary to represent the decimal exponent of 2. If the value is zero, the exponent is
15638 zero.

15639 A **double** argument representing an infinity or NaN is converted in the style of an *f* or *F*
15640 conversion specifier.

15641 *c* If no *l* (ell) qualifier is present, the **int** argument is converted to a wide character as if by
15642 calling the *btowc*( ) function and the resulting wide character is written. Otherwise, the
15643 **wint_t** argument is converted to **wchar_t**, and written.

15644 *s* If no *l* (ell) qualifier is present, the application shall ensure that the argument is a
15645 pointer to a character array containing a character sequence beginning in the initial
15646 shift state. Characters from the array are converted as if by repeated calls to the
15647 *mbrtowc*( ) function, with the conversion state described by an **mbstate_t** object
15648 initialized to zero before the first character is converted, and written up to (but not
15649 including) the terminating null wide character. If the precision is specified, no more
15650 than that many wide characters are written. If the precision is not specified, or is
15651 greater than the size of the array, the application shall ensure that the array contains a
15652 null wide character.

15653 If an *l* (ell) qualifier is present, the application shall ensure that the argument is a
15654 pointer to an array of type **wchar_t**. Wide characters from the array are written up to
15655 (but not including) a terminating null wide character. If no precision is specified, or is
15656 greater than the size of the array, the application shall ensure that the array contains a
15657 null wide character. If a precision is specified, no more than that many wide characters
15658 are written.

15659 *p* The application shall ensure that the argument is a pointer to **void**. The value of the
15660 pointer is converted to a sequence of printable wide characters, in an implementation-
15661 defined manner.

15662 *n* The application shall ensure that the argument is a pointer to an integer into which is
15663 written the number of wide characters written to the output so far by this call to one of
15664 the *fwprintf*( ) functions. No argument is converted, but one is consumed. If the
15665 conversion specification includes any flags, a field width, or a precision, the behavior is
15666 undefined.

15667 XSI *C* Same as *lc*.

15668 XSI *S* Same as *ls*.

15669 % Output a '%' wide character; no argument is converted. The entire conversion
15670 specification shall be "%%".

15671 If a conversion specification does not match one of the above forms, the behavior is undefined.

15672 In no case does a nonexistent or small field width cause truncation of a field; if the result of a
15673 conversion is wider than the field width, the field is simply expanded to contain the conversion
15674 result. Characters generated by *fwprintf*( ) and *wprintf*( ) are printed as if *fputwc*( ) had been
15675 called.

For *a* and *A* conversions, if FLT_RADIX is a power of 2, the value is correctly rounded to a hexadecimal floating number with the given precision.

If FLT_RADIX is not a power of 2, the result should be one of the two adjacent numbers in hexadecimal floating style with the given precision, with the extra stipulation that the error should have a correct sign for the current rounding direction.

For *e*, *E*, *f*, *F*, *g*, and *G* conversions, if the number of significant decimal digits is at most DECIMAL_DIG, then the result should be correctly rounded. If the number of significant decimal digits is more than DECIMAL_DIG but the source value is exactly representable with DECIMAL_DIG digits, then the result should be an exact representation with trailing zeros. Otherwise, the source value is bounded by two adjacent decimal strings "L < U", both having DECIMAL_DIG significant digits; the value of the resultant decimal string "D" should satisfy "L <= D <= U", with the extra stipulation that the error should have a correct sign for the current rounding direction.

CX The *st_ctime* and *st_mtime* fields of the file shall be marked for update between the call to a successful execution of *fwprintf*( ) or *wprintf*( ) and the next successful completion of a call to *fflush*( ) or *fclose*( ) on the same stream, or a call to *exit*( ) or *abort*( ).

RETURN VALUE

Upon successful completion, these functions shall return the number of wide characters transmitted, excluding the terminating null wide character in the case of *swprintf*( ), or a negative CX value if an output error was encountered, and set *errno* to indicate the error.

If *n* or more wide characters were requested to be written, *swprintf*( ) shall return a negative CX value, and set *errno* to indicate the error.

ERRORS

For the conditions under which *fwprintf*( ) and *wprintf*( ) fail and may fail, refer to *fputwc*( ).

In addition, all forms of *fwprintf*( ) may fail if:

XSI [EILSEQ] A wide-character code that does not correspond to a valid character has been detected.

XSI [EINVAL] There are insufficient arguments.

In addition, *wprintf*( ) and *fwprintf*( ) may fail if:

XSI [ENOMEM] Insufficient storage space is available.

EXAMPLES

To print the language-independent date and time format, the following statement could be used:

```
wprintf(format, weekday, month, day, hour, min);
```

For American usage, *format* could be a pointer to the wide-character string:

```
L"%s, %s %d, %d:%.2d\n"
```

producing the message:

```
Sunday, July 3, 10:02
```

whereas for German usage, *format* could be a pointer to the wide-character string:

```
L"%1$s, %3$d. %2$s, %4$d:%5$.2d\n"
```

producing the message:

```
Sonntag, 3. Juli, 10:02
```

15736 • The DESCRIPTION is updated. |

NAME

fwrite — binary output

SYNOPSIS

```
#include <stdio.h>

size_t fwrite(const void *restrict ptr, size_t size, size_t nitems,
    FILE *restrict stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

The *fwrite*( ) function shall write, from the array pointed to by *ptr*, up to *nitems* members whose size is specified by *size*, to the stream pointed to by *stream*. For each object, size calls are made to the *fputc*( ) function, taking the values (in order) from an array of **unsigned char** exactly overlaying the object. The file-position indicator for the stream (if defined) shall be advanced by the number of bytes successfully written. If an error occurs, the resulting value of the file-position indicator for the stream is indeterminate.

CX The *st_ctime* and *st_mtime* fields of the file shall be marked for update between the successful execution of *fwrite*( ) and the next successful completion of a call to *fflush*( ) or *fclose*( ) on the same stream, or a call to *exit*( ) or *abort*( ).

RETURN VALUE

The *fwrite*( ) function shall return the number of members successfully written, which may be less than *nitems* if a write error is encountered. If *size* or *nitems* is 0, *fwrite*( ) shall return 0 and the state of the stream remains unchanged. Otherwise, if a write error occurs, the error indicator for the stream shall be set, CX and *errno* shall be set to indicate the error.

ERRORS

Refer to *fputc*( ).

EXAMPLES

None.

APPLICATION USAGE

Because of possible differences in member length and byte ordering, files written using *fwrite*( ) are application-dependent, and possibly cannot be read using *fread*( ) by a different application or by the same application on a different processor.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

In the DESCRIPTION, the text is changed to make it clear that the function advances the file-position indicator by the number of bytes successfully written rather than the number of characters, which could include multi-byte sequences.

The following change is incorporated for alignment with the ISO C standard:

- The type of argument *ptr* is changed from **void*** to **const void***.

Issue 6

Extensions beyond the ISO C standard are now marked.

The following changes are made for alignment with the ISO / IEC 9899: 1999 standard:

- The *fwrite*( ) prototype is updated.
- The DESCRIPTION is updated to clarify how the data is written out using *fputc*( ).

15789 **NAME**

15790 fwscanf, swscanf, wscanf — convert formatted wide-character input

15791 **SYNOPSIS**

15792 ```
#include <stdio.h>
```

15793 ```
#include <wchar.h>
```

15794 ```
int fwscanf(FILE *restrict stream, const wchar_t *restrict format, ...);
```

15795 ```
int swscanf(const wchar_t *restrict ws,
```

15796 ```
    const wchar_t *restrict format, ...);
```

15797 ```
int wscanf(const wchar_t *format, ... );
```

15798 **DESCRIPTION**

15799 CX The functionality described on this reference page is aligned with the ISO C standard. Any
15800 conflict between the requirements described here and the ISO C standard is unintentional. This
15801 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

15802 The *fwscanf*( ) function reads from the named input *stream*. The *wscanf*( ) function reads from the
15803 standard input stream *stdin*. The *swscanf*( ) function reads from the wide-character string *ws*.
15804 Each function reads wide characters, interprets them according to a format, and stores the
15805 results in its arguments. Each expects, as arguments, a control wide-character string *format*
15806 described below, and a set of *pointer* arguments indicating where the converted input should be
15807 stored. The result is undefined if there are insufficient arguments for the format. If the format is
15808 exhausted while arguments remain, the excess arguments are evaluated but are otherwise
15809 ignored.

15810 XSI Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than
15811 to the next unused argument. In this case, the conversion wide character '%' (see below) is
15812 replaced by the sequence "%n$", where *n* is a decimal integer in the range [1,{NL_ARGMAX}].
15813 This feature provides for the definition of format wide-character strings that select arguments in
15814 an order appropriate to specific languages. In format wide-character strings containing the
15815 "%n$" form of conversion specifications, it is unspecified whether numbered arguments in the
15816 argument list can be referenced from the format wide-character string more than once.

15817 The *format* can contain either form of a conversion specification—that is, '%' or "%n$"—but the
15818 two forms cannot normally be mixed within a single *format* wide-character string. The only
15819 exception to this is that "%%" or "%*" can be mixed with the "%n$" form.

15820 The *fwscanf*( ) function in all its forms allows for detection of a language-dependent radix
15821 character in the input string, encoded as a wide-character value. The radix character is defined in
15822 the program's locale (category *LC_NUMERIC*). In the POSIX locale, or in a locale where the
15823 radix character is not defined, the radix character defaults to a period ('.').

15824 The *format* is a wide-character string composed of zero or more directives. Each directive is
15825 composed of one of the following: one or more white-space wide characters (<space>, <tab>,
15826 <newline>, <vertical-tab>, or <form-feed> characters); an ordinary wide character (neither '%'
15827 nor a white-space character); or a conversion specification. Each conversion specification is
15828 XSI introduced by a '%' or the sequence "%n$" after which the following appear in sequence:

15829 - An optional assignment-suppressing character '*'.
15830 - An optional non-zero decimal integer that specifies the maximum field width.
15831 - An optional length modifier that specifies the size of the receiving object.
15832 - A conversion wide character that specifies the type of conversion to be applied. The valid
15833 conversion wide characters are described below.

The *fwscanf*( ) functions execute each directive of the format in turn. If a directive fails, as detailed below, the function shall return. Failures are described as input failures (due to the unavailability of input bytes) or matching failures (due to inappropriate input).

A directive composed of one or more white-space wide characters is executed by reading input until no more valid input can be read, or up to the first wide character which is not a white-space wide character, which remains unread.

A directive that is an ordinary wide character is executed as follows. The next wide character is read from the input and compared with the wide character that comprises the directive; if the comparison shows that they are not equivalent, the directive fails, and the differing and subsequent wide characters remain unread. Similarly, if end-of-file, an encoding error, or a read error prevents a wide character from being read, the directive fails.

A directive that is a conversion specification defines a set of matching input sequences, as described below for each conversion wide character. A conversion specification is executed in the following steps.

Input white-space wide characters (as specified by *iswspace*( )) are skipped, unless the conversion specification includes a '[', *c*, or *n* conversion character.

An item is read from the input, unless the conversion specification includes an *n* conversion wide character. An input item is defined as the longest sequence of input wide characters, not exceeding any specified field width, which is an initial subsequence of a matching sequence. The first wide character, if any, after the input item remains unread. If the length of the input item is 0, the execution of the conversion specification fails; this condition is a matching failure, unless end-of-file, an encoding error, or a read error prevented input from the stream, in which case it is an input failure.

Except in the case of a '%' conversion wide character, the input item (or, in the case of a %*n* conversion specification, the count of input wide characters) is converted to a type appropriate to the conversion wide character. If the input item is not a matching sequence, the execution of the conversion specification fails; this condition is a matching failure. Unless assignment suppression was indicated by a '*', the result of the conversion is placed in the object pointed to by the first argument following the *format* argument that has not already received a
XSI conversion result if the conversion specification is introduced by '%', or in the *n*th argument if introduced by the wide-character sequence "%n$". If this object does not have an appropriate type, or if the result of the conversion cannot be represented in the space provided, the behavior is undefined.

The length modifiers and their meanings are:

hh Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an argument with type pointer to **signed char** or **unsigned char**.

h Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an argument with type pointer to **short** or **unsigned short**.

l (ell) Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an argument with type pointer to **long** or **unsigned long**; that a following *a*, *A*, *e*, *E*, *f*, *F*, *g*, or *G* conversion specifier applies to an argument with type pointer to **double**; or that a following *c*, *s*, or '[' conversion specifier applies to an argument with type pointer to **wchar_t**.

ll (ell-ell) Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an argument with type pointer to **long long** or **unsigned long long**.

15879 *j* Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an argument
15880 with type pointer to **intmax_t** or **uintmax_t**.

15881 *z* Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an argument
15882 with type pointer to **size_t** or the corresponding signed integer type.

15883 *t* Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an argument
15884 with type pointer to **ptrdiff_t** or the corresponding **unsigned** type.

15885 *L* Specifies that a following *a*, *A*, *e*, *E*, *f*, *F*, *g*, or *G* conversion specifier applies to an
15886 argument with type pointer to **long double**.

15887 If a length modifier appears with any conversion specifier other than as specified above, the
15888 behavior is undefined.

15889 The following conversion wide characters are valid:

15890 *d* Matches an optionally signed decimal integer, whose format is the same as expected for
15891 the subject sequence of *wcstol*( ) with the value 10 for the *base* argument. In the absence
15892 of a size modifier, the application shall ensure that the corresponding argument is a
15893 pointer to **int**.

15894 *i* Matches an optionally signed integer, whose format is the same as expected for the
15895 subject sequence of *wcstol*( ) with 0 for the *base* argument. In the absence of a size
15896 modifier, the application shall ensure that the corresponding argument is a pointer to
15897 **int**.

15898 *o* Matches an optionally signed octal integer, whose format is the same as expected for
15899 the subject sequence of *wcstoul*( ) with the value 8 for the *base* argument. In the absence
15900 of a size modifier, the application shall ensure that the corresponding argument is a
15901 pointer to **unsigned**.

15902 *u* Matches an optionally signed decimal integer, whose format is the same as expected for
15903 the subject sequence of *wcstoul*( ) with the value 10 for the *base* argument. In the absence
15904 of a size modifier, the application shall ensure that the corresponding argument is a
15905 pointer to **unsigned**.

15906 *x* Matches an optionally signed hexadecimal integer, whose format is the same as
15907 expected for the subject sequence of *wcstoul*( ) with the value 16 for the *base* argument.
15908 In the absence of a size modifier, the application shall ensure that the corresponding
15909 argument is a pointer to **unsigned**.

15910 *a*, *e*, *f*, *g* Matches an optionally signed floating-point number, infinity, or NaN whose format is
15911 the same as expected for the subject sequence of *wcstod*( ). In the absence of a size
15912 modifier, the application shall ensure that the corresponding argument is a pointer to
15913 **float**.

15914 If the *fwprintf*( ) family of functions generates character string representations for
15915 infinity and NaN (a symbolic entity encoded in floating-point format) to support
15916 IEEE Std. 754-1985, the *fwscanf*( ) family of functions shall recognize them as input.

15917 *s* Matches a sequence of non white-space wide characters. If no *l* (ell) qualifier is present,
15918 characters from the input field are converted as if by repeated calls to the *wcrtomb*( )
15919 function, with the conversion state described by an **mbstate_t** object initialized to zero
15920 before the first wide character is converted. The application shall ensure that the
15921 corresponding argument is a pointer to a character array large enough to accept the
15922 sequence and the terminating null character, which shall be added automatically.

Otherwise, the application shall ensure that the corresponding argument is a pointer to an array of **wchar_t** large enough to accept the sequence and the terminating null wide character, which shall be added automatically.

[Matches a non-empty sequence of wide characters from a set of expected wide characters (the *scanset*). If no *l* (ell) qualifier is present, wide characters from the input field are converted as if by repeated calls to the *wcrtomb*( ) function, with the conversion state described by an **mbstate_t** object initialized to zero before the first wide character is converted. The application shall ensure that the corresponding argument is a pointer to a character array large enough to accept the sequence and the terminating null character, which shall be added automatically.

If an *l* (ell) qualifier is present, the application shall ensure that the corresponding argument is a pointer to an array of **wchar_t** large enough to accept the sequence and the terminating null wide character, which shall be added automatically.

The conversion specification includes all subsequent wide characters in the *format* string up to and including the matching right square bracket (']'). The wide characters between the square brackets (the *scanlist*) comprise the scanset, unless the wide character after the left square bracket is a circumflex ('^'), in which case the scanset contains all wide characters that do not appear in the scanlist between the circumflex and the right square bracket. If the conversion specification begins with "[]" or "[^]", the right square bracket is included in the scanlist and the next right square bracket is the matching right square bracket that ends the conversion specification; otherwise, the first right square bracket is the one that ends the conversion specification. If a '-' is in the scanlist and is not the first wide character, nor the second where the first wide character is a '^', nor the last wide character, the behavior is implementation-defined.

c Matches a sequence of wide characters of exactly the number specified by the field width (1 if no field width is present in the conversion specification).

If no *l* (ell) length modifier is present, characters from the input field are converted as if by repeated calls to the *wcrtomb*( ) function, with the conversion state described by an **mbstate_t** object initialized to zero before the first wide character is converted. The corresponding argument shall be a pointer to the initial element of a character array large enough to accept the sequence. No null character is added.

If an *l* (ell) length modifier is present, the corresponding argument shall be a pointer to the initial element of an array of **wchar_t** large enough to accept the sequence. No null wide character is added.

Otherwise, the application shall ensure that the corresponding argument is a pointer to an array of **wchar_t** large enough to accept the sequence. No null wide character is added.

p Matches an implementation-defined set of sequences, which shall be the same as the set of sequences that is produced by the %*p* conversion of the corresponding *fwprintf*( ) functions. The application shall ensure that the corresponding argument is a pointer to a pointer to **void**. The interpretation of the input item is implementation-defined. If the input item is a value converted earlier during the same program execution, the pointer that results shall compare equal to that value; otherwise, the behavior of the %*p* conversion is undefined.

n No input is consumed. The application shall ensure that the corresponding argument is a pointer to the integer into which is to be written the number of wide characters read from the input so far by this call to the *fwscanf*( ) functions. Execution of a %*n*

15971 conversion specification does not increment the assignment count returned at the
15972 completion of execution of the function. No argument is converted, but one is
15973 consumed. If the conversion specification includes an assignment-suppressing wide
15974 character or a field width, the behavior is undefined.

15975 XSI *C* Same as *lc*.

15976 *S* Same as *ls*.

15977 % Matches a single '%'; no conversion or assignment occurs. The complete conversion
15978 specification shall be "%%".

15979 If a conversion specification is invalid, the behavior is undefined.

15980 The conversion characters *A*, *E*, *F*, *G*, and *X* are also valid and behave the same as, respectively, *a*,
15981 *e*, *f*, *g*, and *x*.

15982 If end-of-file is encountered during input, conversion is terminated. If end-of-file occurs before
15983 any wide characters matching the current conversion specification (except for %*n*) have been
15984 read (other than leading white-space, where permitted), execution of the current conversion
15985 specification terminates with an input failure. Otherwise, unless execution of the current
15986 conversion specification is terminated with a matching failure, execution of the following
15987 conversion specification (if any) is terminated with an input failure.

15988 Reaching the end of the string in *swscanf*() is equivalent to encountering end-of-file for *fwscanf*().

15989 If conversion terminates on a conflicting input, the offending input is left unread in the input.
15990 Any trailing white space (including <newline>) is left unread unless matched by a conversion
15991 specification. The success of literal matches and suppressed assignments is only directly
15992 determinable via the %*n* conversion specification.

15993 The *fwscanf*() and *wscanf*() functions may mark the *st_atime* field of the file associated with
15994 *stream* for update. The *st_atime* field shall be marked for update by the first successful execution
15995 of *fgetc*(), *fgetwc*(), *fgets*(), *fgetws*(), *fread*(), *getc*(), *getwc*(), *getchar*(), *getwchar*(), *gets*(), *fscanf*(),
15996 or *fwscanf*() using *stream* that returns data not supplied by a prior call to *ungetc*().

15997 **RETURN VALUE**

15998 Upon successful completion, these functions shall return the number of successfully matched
15999 and assigned input items; this number can be 0 in the event of an early matching failure. If the
16000 input ends before the first matching failure or conversion, EOF shall be returned. If a read error
16001 CX occurs the error indicator for the stream is set, EOF shall be returned, and *errno* shall be set to
16002 indicate the error.

16003 **ERRORS**

16004 For the conditions under which the *fwscanf*() functions shall fail and may fail, refer to *fgetwc*().

16005 In addition, *fwscanf*() may fail if:

16006 XSI [EILSEQ] Input byte sequence does not form a valid character.

16007 XSI [EINVAL] There are insufficient arguments.

16008 **EXAMPLES**

16009 The call:

16010 ```
int i, n; float x; char name[50];
16011 n = wscanf(L"%d%f%s", &i, &x, name);
```

16012 with the input line:

16013 ```
25 54.32E-1 Hamster
```

16014 assigns to *n* the value 3, to *i* the value 25, to *x* the value 5.432, and *name* contains the string
16015 `"Hamster"`.

16016 The call:

16017 ```
int i; float x; char name[50];
16018 (void) wscanf(L"%2d%f%*d %[0123456789]", &i, &x, name);
```

16019 with input:

16020 ```
56789 0123 56a72
```

16021 assigns 56 to *i*, 789.0 to *x*, skip 0123, and place the string `"56\0"` in *name*. The next call to
16022 *getchar*( ) shall return the character `'a'`.

16023 **APPLICATION USAGE**

16024 In format strings containing the `'%'` form of conversion specifications, each argument in the
16025 argument list is used exactly once.

16026 **RATIONALE**

16027 None.

16028 **FUTURE DIRECTIONS**

16029 None.

16030 **SEE ALSO**

16031 *getwc*( ), *fwprintf*( ), *setlocale*( ), *wcstod*( ), *wcstol*( ), *wcstoul*( ), *wcrtomb*( ), the Base Definitions

16034 **CHANGE HISTORY**

16035 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
16036 (E).

16037 **Issue 6**

16038 The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

16039 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

16040 • The prototypes for *fwscanf*( ) and *swscanf*( ) are updated.

16041 • The DESCRIPTION is updated.

16042 **NAME**

16043 gai_strerror — address and name information error description

16044 **SYNOPSIS**

16045 `#include <netdb.h>`

16046 `char *gai_strerror(int ecode);`

16047 **DESCRIPTION**

16048 The *gai_strerror*( ) function shall return a text string describing an error that is listed in the
16049 **<netdb.h>** header.

16050 When the *ecode* argument is one of the values listed in the **<netdb.h>** header, the function return
16051 value points to a string describing the error. If the argument is not one of those values, the
16052 function shall return a pointer to a string whose contents indicate an unknown error.

16053 **RETURN VALUE**

16054 Upon successful completion, *gai_strerror*( ) shall return a pointer to an implementation-defined |
16055 string. |

16056 **ERRORS**

16057 No errors are defined.

16058 **EXAMPLES**

16059 None.

16060 **APPLICATION USAGE**

16061 None.

16062 **RATIONALE**

16063 None.

16064 **FUTURE DIRECTIONS**

16065 None.

16070 **NAME**

16071 gcvt — convert a floating-point number to a string (**LEGACY**)

16072 **SYNOPSIS**

16073 XSI
```
#include <stdlib.h>
```

16074
```
char *gcvt(double value, int ndigit, char *buf);
```

16075

16076 **DESCRIPTION**

16077 Refer to *ecvt*( ).

16078 **NAME**

16079 getaddrinfo — get address information

16080 **SYNOPSIS**

16081 `#include <sys/socket.h>`

16082 `#include <netdb.h>`

16083 `int getaddrinfo(const char *restrict` *`nodename`*`,` |

16084 `    const char *restrict` *`servname`*`,` |

16085 `    const struct addrinfo *restrict` *`hints`*`,` |

16086 `    struct addrinfo **restrict` *`res`*`);` |

16087 **DESCRIPTION** |

16088 Refer to *freeaddrinfo*( ).

16089 **NAME**

16090 getc — get a byte from a stream

16091 **SYNOPSIS**

16092 `#include <stdio.h>`

16093 `int getc(FILE *stream);`

16094 **DESCRIPTION**

16095 CX The functionality described on this reference page is aligned with the ISO C standard. Any
16096 conflict between the requirements described here and the ISO C standard is unintentional. This
16097 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

16098 The *getc*( ) function shall be equivalent to *fgetc*( ), except that if it is implemented as a macro it
16099 may evaluate *stream* more than once, so the argument should never be an expression with side
16100 effects.

16101 **RETURN VALUE**

16102 Refer to *fgetc*( ).

16103 **ERRORS**

16104 Refer to *fgetc*( ).

16105 **EXAMPLES**

16106 None.

16107 **APPLICATION USAGE**

16108 If the integer value returned by *getc*( ) is stored into a variable of type **char** and then compared
16109 against the integer constant EOF, the comparison may never succeed, because sign-extension of
16110 a variable of type **char** on widening to integer is implementation-defined. |

16111 Because it may be implemented as a macro, *getc*( ) may treat incorrectly a *stream* argument with
16112 side effects. In particular, *getc*(*f*++) does not necessarily work as expected. Therefore, use of this
16113 function should be preceded by `"#undef getc"` in such situations; *fgetc*( ) could also be used.

16114 **RATIONALE**

16115 None.

16116 **FUTURE DIRECTIONS**

16117 None.

16118 **SEE ALSO**

16119 *fgetc*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdio.h>** |

16120 **CHANGE HISTORY**

16121 First released in Issue 1. Derived from Issue 1 of the SVID. |

16122 **Issue 4**

16123 The words ‘‘a character variable’’ are replaced by ‘‘a variable of type **char**’’, to emphasize the fact
16124 that this function deals with byte values.

16125 The APPLICATION USAGE section now states that the use of this function is not recommended.

16126 **NAME**

16127 getc_unlocked, getchar_unlocked, putc_unlocked, putchar_unlocked — stdio with explicit client
16128 locking

16129 **SYNOPSIS**

16130 TSF
```
#include <stdio.h>

int getc_unlocked(FILE *stream);
int getchar_unlocked(void);
int putc_unlocked(int c, FILE *stream);
int putchar_unlocked(int c);
```
16135

16136 **DESCRIPTION**

16137 Versions of the functions *getc*(), *getchar*(), *putc*(), and *putchar*() respectively named
16138 *getc_unlocked*(), *getchar_unlocked*(), *putc_unlocked*(), and *putchar_unlocked*() shall be provided
16139 which are functionally identical to the original versions, with the exception that they are not
16140 required to be implemented in a thread-safe manner. They may only safely be used within a
16141 scope protected by *flockfile*() (or *ftrylockfile*()) and *funlockfile*(). These functions may safely be
16142 used in a multi-threaded program if and only if they are called while the invoking thread owns
16143 the (**FILE***) object, as is the case after a successful call of the *flockfile*() or *ftrylockfile*() functions.

16144 **RETURN VALUE**

16145 See *getc*(), *getchar*(), *putc*(), and *putchar*().

16146 **ERRORS**

16147 No errors are defined.

16148 **EXAMPLES**

16149 None.

16150 **APPLICATION USAGE**

16151 Because they may be implemented as macros, *getc_unlocked*() and *putc_unlocked*() may treat
16152 incorrectly a stream argument with side effects. In particular, *getc_unlocked*(*f++) and
16153 *putc_unlocked*(*f++) do not necessarily work as expected. Therefore, use of these functions in
16154 such situations should be preceded by the following statement as appropriate:

```
16155 #undef getc_unlocked
16156 #undef putc_unlocked
```

16157 **RATIONALE**

16158 Some I/O functions are typically implemented as macros for performance reasons (for example,
16159 *putc*() and *getc*()). For safety, they need to be synchronized, but it is often too expensive to
16160 synchronize on every character. Nevertheless, it was felt that the safety concerns were more
16161 important; consequently, the *getc*(), *getchar*(), *putc*(), and *putchar*() functions are required to be
16162 thread-safe. However, unlocked versions are also provided with names that clearly indicate the
16163 unsafe nature of their operation but can be used to exploit their higher performance. These
16164 unlocked versions can be safely used only within explicitly locked program regions, using
16165 exported locking primitives. In particular, a sequence such as:

```
16166 flockfile(fileptr);
16167 putc_unlocked('1', fileptr);
16168 putc_unlocked('\n', fileptr);
16169 fprintf(fileptr, "Line 2\n");
16170 funlockfile(fileptr);
```

16171 is permissible, and results in the text sequence:

```
1
Line 2
```

being printed without being interspersed with output from other threads.

It would be wrong to have the standard names such as *getc*( ), *putc*( ), and so on, map to the ''faster, but unsafe'' rather than the ''slower, but safe'' versions. In either case, you would still want to inspect all uses of *getc*( ), *putc*( ), and so on, by hand when converting existing code. Choosing the safe bindings as the default, at least, results in correct code and maintains the ''atomicity at the function'' invariant. To do otherwise would introduce gratuitous synchronization errors into converted code. Other routines that modify the *stdio* (**FILE***) structures or buffers are also safely synchronized.

Note that there is no need for functions of the form *getc_locked*( ), *putc_locked*( ), and so on, since this is the functionality of *getc*( ), *putc*( ), *et al*. It would be inappropriate to use a feature test macro to switch a macro definition of *getc*( ) between *getc_locked*( ) and *getc_unlocked*( ), since the ISO C standard requires an actual function to exist, a function whose behavior could not be changed by the feature test macro. Also, providing both the *xxx_locked*( ) and *xxx_unlocked*( ) forms leads to the confusion of whether the suffix describes the behavior of the function or the circumstances under which it should be used.

Three additional routines, *flockfile*( ), *ftrylockfile*( ), and *funlockfile*( ) (which may be macros), are provided to allow the user to delineate a sequence of I/O statements that are executed synchronously.

The *ungetc*( ) function is infrequently called relative to the other functions/macros so no unlocked variation is needed.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

These functions are marked as part of the Thread-Safe Functions option.

The Open Group corrigenda item U030/2 has been applied adding APPLICATION USAGE describing how applications should be written to avoid the case when the functions are implemented as macros.

16206 **NAME**

16207 getchar — get a byte from a stdin stream

16208 **SYNOPSIS**

16209
```
#include <stdio.h>
```

16210
```
int getchar(void);
```

16211 **DESCRIPTION**

16212 CX The functionality described on this reference page is aligned with the ISO C standard. Any
16213 conflict between the requirements described here and the ISO C standard is unintentional. This
16214 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

16215 The *getchar*( ) function shall be equivalent to *getc*(*stdin*).

16216 **RETURN VALUE**

16217 Refer to *fgetc*( ).

16218 **ERRORS**

16219 Refer to *fgetc*( ).

16220 **EXAMPLES**

16221 None.

16222 **APPLICATION USAGE**

16223 If the integer value returned by *getchar*( ) is stored into a variable of type **char** and then
16224 compared against the integer constant EOF, the comparison may never succeed, because sign-
16225 extension of a variable of type **char** on widening to integer is implementation-defined. |

16226 **RATIONALE**

16227 None.

16228 **FUTURE DIRECTIONS**

16229 None.

16230 **SEE ALSO**

16231 *getc*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdio.h>** |

16232 **CHANGE HISTORY**

16233 First released in Issue 1. Derived from Issue 1 of the SVID. |

16234 **Issue 4**

16235 The words ‘‘a character variable’’ are replaced by ‘‘a variable of type **char**’’, to emphasize the fact
16236 that this function deals in byte values.

16237 The following change is incorporated for alignment with the ISO C standard:

16238 • The argument list is explicitly defined as **void**.

16239 **NAME**

16240 getcontext, setcontext — get and set current user context

16241 **SYNOPSIS**

16242 XSI
```
#include <ucontext.h>

int getcontext(ucontext_t *ucp);
int setcontext(const ucontext_t *ucp);
```
16243

16244

16245

16246 **DESCRIPTION**

16247 The *getcontext*( ) function shall initialize the structure pointed to by *ucp* to the current user
16248 context of the calling thread. The **ucontext_t** type that *ucp* points to defines the user context and
16249 includes the contents of the calling thread's machine registers, the signal mask, and the current
16250 execution stack.

16251 The *setcontext*( ) function shall restore the user context pointed to by *ucp*. A successful call to
16252 *setcontext*( ) shall not return; program execution resumes at the point specified by the *ucp*
16253 argument passed to *setcontext*( ). The *ucp* argument should be created either by a prior call to
16254 *getcontext*( ) or *makecontext*( ), or by being passed as an argument to a signal handler. If the *ucp*
16255 argument was created with *getcontext*( ), program execution continues as if the corresponding
16256 call of *getcontext*( ) had just returned. If the *ucp* argument was created with *makecontext*( ),
16257 program execution continues with the function passed to *makecontext*( ). When that function
16258 returns, the thread shall continue as if after a call to *setcontext*( ) with the *ucp* argument that was
16259 input to *makecontext*( ). If the *uc_link* member of the **ucontext_t** structure pointed to by the *ucp*
16260 argument is equal to 0, then this context is the main context, and the thread shall exit when this
16261 context returns. The effects of passing a *ucp* argument obtained from any other source are
16262 unspecified.

16263 **RETURN VALUE**

16264 Upon successful completion, *setcontext*( ) shall not return and *getcontext*( ) shall return 0;
16265 otherwise, a value of –1 shall be returned.

16266 **ERRORS**

16267 No errors are defined.

16268 **EXAMPLES**

16269 None.

16270 **APPLICATION USAGE**

16271 When a signal handler is executed, the current user context is saved and a new context is
16272 created. If the thread leaves the signal handler via *longjmp*( ), then it is unspecified whether the
16273 context at the time of the corresponding *setjmp*( ) call is restored and thus whether future calls to
16274 *getcontext*( ) provide an accurate representation of the current context, since the context restored
16275 by *longjmp*( ) does not necessarily contain all the information that *setcontext*( ) requires. Signal
16276 handlers should use *siglongjmp*( ) or *setcontext*( ) instead.

16277 Portable applications should not modify or access the *uc_mcontext* member of **ucontext_t**. A
16278 portable application cannot assume that context includes any process-wide static data, possibly
16279 including *errno*. Users manipulating contexts should take care to handle these explicitly when
16280 required.

16281 Use of contexts to create alternate stacks is not defined by this volume of IEEE Std. 1003.1-200x.

16282 **RATIONALE**

16283 None.

16284 **FUTURE DIRECTIONS**

16285 None.

16286 **SEE ALSO**

16287 *bsd_signal*( ), *makecontext*( ), *setjmp*( ), *sigaction*( ), *sigaltstack*( ), *sigprocmask*( ), *sigsetjmp*( ), the Base |
16288 Definitions volume of IEEE Std. 1003.1-200x, **<ucontext.h>** |

16289 **CHANGE HISTORY**

16290 First released in Issue 4, Version 2.

16291 **Issue 5**

16292 Moved from X/OPEN UNIX extension to BASE.

16293 The following sentence was removed from the DESCRIPTION: ‘‘If the *ucp* argument was passed
16294 to a signal handler, program execution continues with the program instruction following the
16295 instruction interrupted by the signal.’’

16296 **NAME**

16297 getcwd — get the path name of the current working directory

16298 **SYNOPSIS**

16299 ```
#include <unistd.h>
```

16300 ```
char *getcwd(char *buf, size_t size);
```

16301 **DESCRIPTION**

16302 The *getcwd*( ) function shall place an absolute path name of the current working directory in the
16303 array pointed to by *buf*, and return *buf*. The path name copied to the array shall contain no
16304 components that are symbolic links. The *size* argument is the size in bytes of the character array
16305 pointed to by the *buf* argument. If *buf* is a null pointer, the behavior of *getcwd*( ) is unspecified. |

16306 **RETURN VALUE**

16307 Upon successful completion, *getcwd*( ) shall return the *buf* argument. Otherwise, *getcwd*( ) shall
16308 return a null pointer and set *errno* to indicate the error. The contents of the array pointed to by
16309 *buf* are then undefined.

16310 **ERRORS**

16311 The *getcwd*( ) function shall fail if:

16312 [EINVAL] The *size* argument is 0. |

16313 [ERANGE] The size argument is greater than 0, but is smaller than the length of the path |
16314 name +1.

16315 The *getcwd*( ) function may fail if:

16316 [EACCES] Read or search permission was denied for a component of the path name. |

16317 [ENOMEM] Insufficient storage space is available. |

16318 **EXAMPLES**

16319 **Determining the Absolute Path Name of the Current Working Directory**

16320 The following example returns a pointer to an array that holds the absolute path name of the
16321 current working directory. The pointer is returned in the *ptr* variable, which points to the *buf*
16322 array where the path name is stored.

```
16323 #include <stdlib.h>
16324 #include <unistd.h>
16325 ...
16326 long size;
16327 char *buf;
16328 char *ptr;
16329 size = pathconf(".", _PC_PATH_MAX);
16330 if ((buf = (char *)malloc((size_t)size)) != NULL)
16331     ptr = getcwd(buf, (size_t)size);
16332 ...
```

16333 **APPLICATION USAGE**

16334 None. |

16335 **RATIONALE**

16336 Since the maximum path name length is arbitrary unless {PATH_MAX} is defined, an
16337 application generally cannot supply a *buf* with *size* {{PATH_MAX} +1}.

16338 Having *getcwd*( ) take no arguments and instead use the *malloc*( ) function to produce space for
16339 the returned argument was considered. The advantage is that *getcwd*( ) knows how big the
16340 working directory path name is and can allocate an appropriate amount of space. But the
16341 programmer would have to use the *free*( ) function to free the resulting object, or each use of
16342 *getcwd*( ) would further reduce the available memory. Also, *malloc*( ) and *free*( ) are used nowhere
16343 else in this volume of IEEE Std. 1003.1-200x. Finally, *getcwd*( ) is taken from the SVID where it
16344 has the two arguments used in this volume of IEEE Std. 1003.1-200x.

16345 The older function *getwd*( ) was rejected for use in this context because it had only a buffer
16346 argument and no *size* argument, and thus had no way to prevent overwriting the buffer, except
16347 to depend on the programmer to provide a large enough buffer.

16348 On some implementations, if *buf* is a null pointer, *getcwd*( ) may obtain *size* bytes of memory |
16349 using *malloc*( ). In this case, the pointer returned by *getcwd*( ) may be used as the argument in a |
16350 subsequent call to *free*( ). Invoking *getcwd*( ) with *buf* as a null pointer is not recommended in |
16351 portable applications. |

16352 If a program is operating in a directory where some (grand)parent directory does not permit
16353 reading, *getcwd*( ) may fail, as in most implementations it must read the directory to determine
16354 the name of the file. This can occur if search, but not read, permission is granted in an
16355 intermediate directory, or if the program is placed in that directory by some more privileged
16356 process (for example, login). Including the [EACCES] error condition makes the reporting of the |
16357 error consistent and warns the application writer that *getcwd*( ) can fail for reasons beyond the
16358 control of the application writer or user. Some implementations can avoid this occurrence (for
16359 example, by implementing *getcwd*( ) using *pwd*, where *pwd* is a set-user-root process), thus the
16360 error was made optional.

16361 Because this volume of IEEE Std. 1003.1-200x permits the addition of other errors, this would be
16362 a common addition and yet one that applications could not be expected to deal with without
16363 this addition.

16364 **FUTURE DIRECTIONS**

16365 None.

16366 **SEE ALSO**

16367 *malloc*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<unistd.h>** |

16368 **CHANGE HISTORY**

16369 First released in Issue 1. Derived from Issue 1 of the SVID. |

16370 **Issue 4**

16371 The **<unistd.h>** header is added to the SYNOPSIS section.

16372 The [ENOMEM] error is marked as an extension.

16373 The words ‘‘as this functionality may be subject to withdrawal’’ have been deleted from the end
16374 of the last sentence in the APPLICATION USAGE section.

16375 The following change is incorporated for alignment with the ISO POSIX-1 standard:

16376 • The DESCRIPTION is changed to indicate that the effects of passing a null pointer in *buf* are
16377 undefined.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [ENOMEM] optional error condition is added.

16382 **NAME**

16383 getdate — convert user format date and time

16384 **SYNOPSIS**

16385 XSI
```
#include <time.h>
```

16386
```
struct tm *getdate(const char *string);
```

16387

16388 **DESCRIPTION**

16389 The *getdate*( ) function shall convert a string representation of a date or time into a broken-down
16390 time.

16391 The external variable or macro *getdate_err* is used by *getdate*( ) to return error values.

16392 Templates are used to parse and interpret the input string. The templates are contained in a text
16393 file identified by the environment variable *DATEMSK*. The *DATEMSK* variable should be set to
16394 indicate the full path name of the file that contains the templates. The first line in the template
16395 that matches the input specification is used for interpretation and conversion into the internal
16396 time format.

16397 The following field descriptors are supported:

16398 %% Same as '%'.

16399 %*a* Abbreviated weekday name.

16400 %*A* Full weekday name.

16401 %*b* Abbreviated month name.

16402 %*B* Full month name.

16403 %*c* Locale's appropriate date and time representation.

16404 %*C* Century number (00-99; leading zeros are permitted but not required).

16405 %*d* Day of month (01-31; the leading 0 is optional).

16406 %*D* Date as %*m* / %*d* / %*y*.

16407 %*e* Same as %*d*.

16408 %*h* Abbreviated month name.

16409 %*H* Hour (00-23).

16410 %*I* Hour (01-12).

16411 %*m* Month number (01-12).

16412 %*M* Minute (00-59).

16413 %*n* Same as <newline>.

16414 %*p* Locale's equivalent of either AM or PM.

16415 %*r* The locale's appropriate representation of time in AM and PM notation. In the POSIX
16416 locale, this is equivalent to %*I*:%*M*:%*S* %*p*.

16417 %*R* Time as %*H*:%*M*.

16418 %*S* Seconds (00-61). Leap seconds are allowed but are not predictable through use of
16419 algorithms.

16420 %*t* Same as <tab>.

16421 %*T* Time as %*H*:%*M*:%*S*.

16422 %*w* Weekday number (Sunday = 0-6).

16423 %*x* Locale's appropriate date representation.

16424 %*X* Locale's appropriate time representation.

16425 %*y* Year within century. When a century is not otherwise specified, values in the range
16426 69-99 refer to years in the twentieth century (1969 to 1999 inclusive); values in the range
16427 00-68 refer to years in the twenty-first century (2000 to 2068 inclusive).

16428 %*Y* Year as *ccyy* (for example, 1994).

16429 %*Z* Timezone name or no characters if no timezone exists. If the timezone supplied by %*Z*
16430 is not the timezone that *getdate*( ) expects, an invalid input specification error shall
16431 result. The *getdate*( ) function calculates an expected timezone based on information
16432 supplied to the function (such as the hour, day, and month).

16433 The match between the template and input specification performed by *getdate*( ) is case-
16434 insensitive.

16435 The month and weekday names can consist of any combination of upper and lowercase letters.
16436 The process can request that the input date or time specification be in a specific language by
16437 setting the *LC_TIME* category (see *setlocale*( )).

16438 Leading 0s are not necessary for the descriptors that allow leading 0s. However, at most two
16439 digits are allowed for those descriptors, including leading 0s. Extra whitespace in either the
16440 template file or in *string* is ignored.

16441 The field descriptors %*c*, %*x*, and %*X* shall not be supported if they include unsupported field
16442 descriptors.

16443 The following rules apply for converting the input specification into the internal format:

16444 • If %*Z* is being scanned, then *getdate*( ) initializes the broken-down time to be the current time
16445 in the scanned timezone. Otherwise, it initializes the broken-down time based on the current
16446 local time as if *localtime*( ) had been called.

16447 • If only the weekday is given, today is assumed if the given day is equal to the current day
16448 and next week if it is less,

16449 • If only the month is given, the current month is assumed if the given month is equal to the
16450 current month and next year if it is less, and no year is given (the first day of month is
16451 assumed if no day is given),

16452 • If no hour, minute, and second are given the current hour, minute, and second are assumed,

16453 • If no date is given, today is assumed if the given hour is greater than the current hour and
16454 tomorrow is assumed if it is less.

16455 If a field descriptor specification in the DATEMSK file does not correspond to one of the field
16456 descriptors above, the behavior is unspecified.

16457 The *getdate*( ) function need not be reentrant. A function that is not required to be reentrant is not
16458 required to be thread-safe.

RETURN VALUE

Upon successful completion, *getdate*() shall return a pointer to a **struct tm**. Otherwise, it shall return a null pointer and set *getdate_err* to indicate the error.

ERRORS

The *getdate*() function shall fail in the following cases, setting *getdate_err* to the value shown in the list below. Any changes to *errno* are unspecified.

1. The *DATEMSK* environment variable is null or undefined.
2. The template file cannot be opened for reading.
3. Failed to get file status information.
4. The template file is not a regular file.
5. An I/O error is encountered while reading the template file.
6. Memory allocation failed (not enough memory available).
7. There is no line in the template that matches the input.
8. Invalid input specification. For example, February 31; or a time is specified that cannot be represented in a **time_t** (representing the time in seconds since the Epoch).

EXAMPLES

1. The following example shows the possible contents of a template:

```
%m
%A %B %d, %Y, %H:%M:%S
%A
%B
%m/%d/%y %I %p
%d,%m,%Y %H:%M
at %A the %dst of %B in %Y
run job at %I %p,%B %dnd
%A den %d. %B %Y %H.%M Uhr
```

2. The following are examples of valid input specifications for the template in Example 1:

```
getdate("10/1/87 4 PM");
getdate("Friday");
getdate("Friday September 18, 1987, 10:30:30");
getdate("24,9,1986 10:30");
getdate("at monday the 1st of december in 1986");
getdate("run job at 3 PM, december 2nd");
```

   If the *LC_TIME* category is set to a German locale that includes *freitag* as a weekday name and *oktober* as a month name, the following would be valid:

```
getdate("freitag den 10. oktober 1986 10.30 Uhr");
```

3. The following example shows how local date and time specification can be defined in the template:

Invocation	Line in Template
`getdate("11/27/86")`	`%m/%d/%y`
`getdate("27.11.86")`	`%d.%m.%y`
`getdate("86-11-27")`	`%y-%m-%d`
`getdate("Friday 12:00:00")`	`%A %H:%M:%S`

4. The following examples help to illustrate the above rules assuming that the current date is Mon Sep 22 12:19:47 EDT 1986 and the *LC_TIME* category is set to the default C locale:

Input	Line in Template	Date
`Mon`	`%a`	Mon Sep 22 12:19:47 EDT 1986
`Sun`	`%a`	Sun Sep 28 12:19:47 EDT 1986
`Fri`	`%a`	Fri Sep 26 12:19:47 EDT 1986
`September`	`%B`	Mon Sep 1 12:19:47 EDT 1986
`January`	`%B`	Thu Jan 1 12:19:47 EST 1987
`December`	`%B`	Mon Dec 1 12:19:47 EST 1986
`Sep Mon`	`%b %a`	Mon Sep 1 12:19:47 EDT 1986
`Jan Fri`	`%b %a`	Fri Jan 2 12:19:47 EST 1987
`Dec Mon`	`%b %a`	Mon Dec 1 12:19:47 EST 1986
`Jan Wed 1989`	`%b %a %Y`	Wed Jan 4 12:19:47 EST 1989
`Fri 9`	`%a %H`	Fri Sep 26 09:00:00 EDT 1986
`Feb 10:30`	`%b %H:%S`	Sun Feb 1 10:00:30 EST 1987
`10:30`	`%H:%M`	Tue Sep 23 10:30:00 EDT 1986
`13:30`	`%H:%M`	Mon Sep 22 13:30:00 EDT 1986

APPLICATION USAGE

Although historical versions of *getdate*() did not require that **<time.h>** declare the external variable *getdate_err*, this volume of IEEE Std. 1003.1-200x does require it. The Open Group encourages applications to remove declarations of *getdate_err* and instead incorporate the declaration by including **<time.h>**.

Applications should use %*Y* (4-digit years) in preference to %*y* (2-digit years).

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The last paragraph of the DESCRIPTION is added.

The %*C* specifier is added, and the exact meaning of the %*y* specifier is clarified in the DESCRIPTION.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

The %*R* specifier is changed to follow historical practice.

Issue 6

The DESCRIPTION is updated to refer to ‘‘seconds since the Epoch’’ rather than ‘‘seconds since 00:00:00 UTC (Coordinated Universal Time), January 1 1970’’ for consistency with other *time* functions.

16547 **NAME**

16548 getegid — get the effective group ID

16549 **SYNOPSIS**

16550
```
#include <unistd.h>
```

16551
```
gid_t getegid(void);
```

16552 **DESCRIPTION**

16553 The *getegid*( ) function shall return the effective group ID of the calling process.

16554 **RETURN VALUE**

16555 The *getegid*( ) function is always successful and no return value is reserved to indicate an error.

16556 **ERRORS**

16557 No errors are defined.

16558 **EXAMPLES**

16559 None.

16560 **APPLICATION USAGE**

16561 None.

16562 **RATIONALE**

16563 None.

16564 **FUTURE DIRECTIONS**

16565 None.

16566 **SEE ALSO**

16567 *geteuid*( ), *getgid*( ), *getuid*( ), *setegid*( ), *seteuid*( ), *setgid*( ), *setregid*( ), *setreuid*( ), *setuid*( ), the Base
16568 Definitions volume of IEEE Std. 1003.1-200x, **<sys/types.h>**, **<unistd.h>**

16569 **CHANGE HISTORY**

16570 First released in Issue 1. Derived from Issue 1 of the SVID.

16571 **Issue 4**

16572 The **<sys/types.h>** header is now marked as optional (OH); this header need not be included on
16573 XSI-conformant systems.

16574 The **<unistd.h>** header is added to the SYNOPSIS section.

16575 The following change is incorporated for alignment with the ISO POSIX-1 standard:

16576 • The argument list is explicitly defined as **void**.

16577 **Issue 6**

16578 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

16579 The following new requirements on POSIX implementations derive from alignment with the
16580 Single UNIX Specification:

16581 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
16582 required for conforming implementations of previous POSIX specifications, it was not
16583 required for UNIX applications.

16584 **NAME**

16585 getenv — get value of an environment variable

16586 **SYNOPSIS**

16587
```
#include <stdlib.h>
```

16588
```
char *getenv(const char *name);
```

16589 **DESCRIPTION**

16590 CX The functionality described on this reference page is aligned with the ISO C standard. Any
16591 conflict between the requirements described here and the ISO C standard is unintentional. This
16592 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

16593 The *getenv*( ) function shall search the environment of the calling process (see the Base
16594 Definitions volume of IEEE Std. 1003.1-200x, Chapter 8, Environment Variables) for the
16595 environment variable *name* if it exists and return a pointer to the value of the environment
16596 variable. If the specified environment variable cannot be found, a null pointer shall be returned.
16597 The application shall ensure that it does not modify the string pointed to by the *getenv*( )
16598 function. The string pointed to may be overwritten by a subsequent call to *getenv*( ), *setenv*( ),
16599 XSI *unsetenv*( ), or *putenv*( ) but shall not be overwritten by a call to any other function in this volume
16600 of IEEE Std. 1003.1-200x.

16601 If the application modifies *environ* or the pointers to which it points, the behavior of *getenv*( ) is
16602 undefined.

16603 CX The *getenv*( ) function need not be reentrant. A function that is not required to be reentrant is not
16604 required to be thread-safe.

16605 **RETURN VALUE**

16606 Upon successful completion, *getenv*( ) shall return a pointer to a string containing the *value* for
16607 the specified *name*. If the specified name cannot be found in the environment of the calling
16608 process, a null pointer shall be returned.

16609 The return value from *getenv*( ) may point to static data which may be overwritten by
16610 XSI subsequent calls to *getenv*( ), *setenv*( ), *unsetenv*( ), or *putenv*( ).

16611 **ERRORS**

16612 No errors are defined.

16613 **EXAMPLES**

16614 **Getting the Value of an Environment Variable**

16615 The following example gets the value of the *HOME* environment variable.

16616
```
#include <stdlib.h>
```
16617
```
...
```
16618
```
const char *name = "HOME";
char *value;
```

16620
```
value = getenv(name);
```

16621 **APPLICATION USAGE**

16622 None.

16623 **RATIONALE**

16624 The *clearenv*( ) function was considered but rejected. The *putenv*( ) function has now been
16625 included for alignment with the Single UNIX Specification.

The *getenv*( ) function is inherently not reentrant because it returns a value pointing to static data.

Conforming applications are required not to modify *environ* directly, but to use only the functions described here to manipulate the process environment as an abstract object. Thus, the implementation of the environment access functions has complete control over the data structure used to represent the environment (subject to the requirement that *environ* be maintained as a list of strings with embedded equal signs for applications that wish to scan the environment). This constraint allows the implementation to properly manage the memory it allocates, either by using allocated storage for all variables (copying them on the first invocation of *setenv*( ) or *unsetenv*( )), or keeping track of which strings are currently in allocated space and which are not, via a separate table or some other means. This enables the implementation to free any allocated space used by strings (and perhaps the pointers to them) stored in *environ* when *unsetenv*( ) is called. A C runtime start-up procedure (that which invokes *main*( ) and perhaps initializes *environ*) can also initialize a flag indicating that none of the environment has yet been copied to allocated storage, or that the separate table has not yet been initialized.

In fact, for higher performance of *getenv*( ), the implementation could also maintain a separate copy of the environment in a data structure that could be searched much more quickly (such as an indexed hash table, or a binary tree), and update both it and the linear list at *environ* when *setenv*( ) or *unsetenv*( ) is invoked.

Performance of *getenv*( ) can be important for applications which have large numbers of environment variables. Typically, applications like this use the environment as a resource database of user-configurable parameters. The fact that these variables are in the user's shell environment usually means that any other program that uses environment variables (such as *ls*, which attempts to use *COLUMNS*, or really almost any utility (*LANG*, *LC_ALL*, and so on) is similarly slowed down by the linear search through the variables.

An implementation that maintains separate data structures, or even one that manages the memory it consumes, is not currently required as it was thought it would reduce consensus among implementors who do not want to change their historical implementations.

The POSIX Threads Extension states that multi-threaded applications must not modify *environ* directly, and that IEEE Std. 1003.1-200x is providing functions which such applications can use in the future to manipulate the environment in a thread-safe manner. Thus, moving away from application use of *environ* is desirable from that standpoint as well.

FUTURE DIRECTIONS

None.

SEE ALSO

exec, *putenv*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdlib.h>**, the Base Definitions volume of IEEE Std. 1003.1-200x, Chapter 8, Environment Variables

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The DESCRIPTION is updated to indicate that the return string must not be modified by an application, may be overwritten by subsequent calls to *getenv*( ) or *putenv*( ), and is not overwritten by calls to other XSI system interfaces.

A reference to *putenv*( ) has also been added to the APPLICATION USAGE section.

The following change is incorporated for alignment with the ISO POSIX-1 standard:

- The type of argument *name* is changed from **char*** to **const char***.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

Issue 6

The following changes were made to align with the IEEE P1003.1a draft standard:

- References added to the new *setenv*( ) and *unsetenv*( ) functions.

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

16680 **NAME**

16681 geteuid — get the effective user ID

16682 **SYNOPSIS**

16683
```
#include <unistd.h>
```

16684
```
uid_t geteuid(void);
```

16685 **DESCRIPTION**

16686 The *geteuid*( ) function shall return the effective user ID of the calling process.

16687 **RETURN VALUE**

16688 The *geteuid*( ) function is always successful and no return value is reserved to indicate an error.

16689 **ERRORS**

16690 No errors are defined.

16691 **EXAMPLES**

16692 None.

16693 **APPLICATION USAGE**

16739 **CHANGE HISTORY**

16740 First released in Issue 1. Derived from Issue 1 of the SVID.

16741 **Issue 4**

16742 The **<sys/types.h>** header is now marked as optional (OH); this header need not be included on
16743 XSI-conformant systems.

16744 The **<unistd.h>** header is added to the SYNOPSIS section.

16745 The following change is incorporated for alignment with the ISO POSIX-1 standard:

16746 - The argument list is explicitly defined as **void**.

16747 **Issue 6**

16748 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

16749 The following new requirements on POSIX implementations derive from alignment with the
16750 Single UNIX Specification:

16751 - The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
16752 required for conforming implementations of previous POSIX specifications, it was not
16753 required for UNIX applications.

16754 **NAME**

16755 getgrent — get the group database entry

16756 **SYNOPSIS**

16757 XSI
```
#include <grp.h>
```

16758
```
struct group *getgrent(void);
```

16759

16760 **DESCRIPTION**

16761 Refer to *endgrent*( ).

16762 **NAME**

16763 getgrgid, getgrgid_r — get group database entry for a group ID

16764 **SYNOPSIS**

16765 ```
#include <grp.h>
```

16766 ```
struct group *getgrgid(gid_t gid);
```

16767 TSF ```
int getgrgid_r(gid_t gid, struct group *grp, char *buffer,
16768   size_t bufsize, struct group **result);
```

16769

16770 **DESCRIPTION**

16771 The *getgrgid*( ) function shall search the group database for an entry with a matching *gid*.

16772 The *getgrgid*( ) function need not be reentrant. A function that is not required to be reentrant is
16773 not required to be thread-safe.

16774 TSF The *getgrgid_r*( ) function updates the **group** structure pointed to by *grp* and stores a pointer to
16775 that structure at the location pointed to by *result*. The structure contains an entry from the
16776 group database with a matching *gid*. Storage referenced by the group structure is allocated from
16777 the memory provided with the *buffer* parameter, which is *bufsize* characters in size. The
16778 maximum size needed for this buffer can be determined with the {_SC_GETGR_R_SIZE_MAX}
16779 *sysconf*( ) parameter. A NULL pointer is returned at the location pointed to by *result* on error or if
16780 the requested entry is not found.

16781 **RETURN VALUE**

16782 Upon successful completion, *getgrgid*( ) shall return a pointer to a **struct group** with the structure
16783 defined in **<grp.h>** with a matching entry if one is found. The *getgrgid*( ) function shall return a
16784 null pointer if either the requested entry was not found, or an error occurred. On error, *errno* |
16785 shall be set to indicate the error. |

16786 The return value may point to a static area which is overwritten by a subsequent call to
16787 *getgrent*( ), *getgrgid*( ), or *getgrnam*( ).

16788 TSF If successful, the *getgrgid_r*( ) function shall return zero; otherwise, an error number shall be
16789 returned to indicate the error.

16790 **ERRORS**

16791 The *getgrgid*( ) and *getgrgid_r*( ) functions may fail if: |

16792 [EIO] An I/O error has occurred. |

16793 [EINTR] A signal was caught during *getgrgid*( ). |

16794 [EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process. |

16795 [ENFILE] The maximum allowable number of files is currently open in the system. |

16796 TSF The *getgrgid_r*( ) function may fail if:

16797 TSF [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to |
16798 be referenced by the resulting **group** structure.
```

EXAMPLES

Finding an Entry in the Group Database

The following example uses *getgrgid*( ) to search the group database for a group ID that was previously stored in a **stat** structure, then prints out the group name if it is found. If the group is not found, the program prints the numeric value of the group for the entry.

```
#include <sys/types.h>
#include <grp.h>
#include <stdio.h>
...
struct stat statbuf;
struct group *grp;
...
if ((grp = getgrgid(statbuf.st_gid)) != NULL)
    printf(" %-8.8s", grp->gr_name);
else
    printf(" %-8d", statbuf.st_gid);
...
```

APPLICATION USAGE

Applications wishing to check for error situations should set *errno* to 0 before calling *getgrgid*( ). If *errno* is set on return, an error occurred.

The *getgrgid_r*( ) function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

endgrent( ), *getgrnam*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<grp.h>**, **<limits.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 1. Derived from System V Release 2.0.

Issue 4

The DESCRIPTION is clarified.

In the RETURN VALUE section, the reference to the setting of *errno* is marked as an extension.

The errors [EIO], [EINTR], [EMFILE], and [ENFILE] are marked as extensions.

A note is added to the APPLICATION USAGE section advising how applications should check for errors.

The **<sys/types.h>** header is added as optional (OH); this header need not be included on XSI-conformant systems.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The *getgrgid_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *getgrgid*() function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *getgrgid_r*() function is marked as part of the Thread-Safe Functions option.

The Open Group corrigenda item U028/3 has been applied correcting text in the DESCRIPTION describing matching the *gid*.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

16859 **NAME**

16860 getgrnam, getgrnam_r — search group database for a name

16861 **SYNOPSIS**

16862 ```
#include <grp.h>

struct group *getgrnam(const char *name);
TSF int getgrnam_r(const char *name, struct group *grp, char *buffer,
        size_t bufsize, struct group **result);
```

16866

16867 **DESCRIPTION**

16868 The *getgrnam*( ) function shall search the group database for an entry with a matching *name*.

16869 The *getgrnam*( ) function need not be reentrant. A function that is not required to be reentrant is
16870 not required to be thread-safe.

16871 TSF The *getgrnam_r*( ) function updates the **group** structure pointed to by *grp* and stores a pointer to
16872 that structure at the location pointed to by *result*. The structure contains an entry from the
16873 group database with a matching *gid* or *name*. Storage referenced by the group structure is
16874 allocated from the memory provided with the *buffer* parameter, which is *bufsize* characters in
16875 size. The maximum size needed for this buffer can be determined with the
16876 {_SC_GETGR_R_SIZE_MAX} *sysconf*( ) parameter. A NULL pointer is returned at the location
16877 pointed to by *result* on error or if the requested entry is not found.

16878 **RETURN VALUE**

16879 The *getgrnam*( ) function shall return a pointer to a **struct group** with the structure defined in
16880 **<grp.h>** with a matching entry if one is found. The *getgrnam*( ) function shall return a null
16881 pointer if either the requested entry was not found, or an error occurred. On error, *errno* shall be |
16882 set to indicate the error. |

16883 The return value may point to a static area which is overwritten by a subsequent call to
16884 *getgrent*( ), *getgrgid*( ), or *getgrnam*( ).

16885 TSF If successful, the *getgrnam_r*( ) function shall return zero; otherwise, an error number shall be
16886 returned to indicate the error.

16887 **ERRORS**

16888 The *getgrnam*( ) and *getgrnam_r*( ) functions may fail if: |

16889 [EIO] An I/O error has occurred. |

16890 [EINTR] A signal was caught during *getgrnam*( ). |

16891 [EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process. |

16892 [ENFILE] The maximum allowable number of files is currently open in the system. |

16893 The *getgrnam_r*( ) function may fail if:

16894 TSF [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to |
16895 be referenced by the resulting **group** structure.
```

16896 **EXAMPLES**

16897 None.

16898 **APPLICATION USAGE**

16899 Applications wishing to check for error situations should set *errno* to 0 before calling *getgrnam*().
16900 If *errno* is set on return, an error occurred.

16901 The *getgrnam_r*() function is thread-safe and shall return values in a user-supplied buffer instead
16902 of possibly using a static data area that may be overwritten by each call.

16903 **RATIONALE**

16904 None.

16905 **FUTURE DIRECTIONS**

16906 None.

16907 **SEE ALSO**

16908 *endgrent*(), *getgrgid*(), the Base Definitions volume of IEEE Std. 1003.1-200x, **<grp.h>**, **<limits.h>**, |
16909 **<sys/types.h>**

16910 **CHANGE HISTORY**

16911 First released in Issue 1. Derived from System V Release 2.0. |

16912 **Issue 4**

16913 The DESCRIPTION is clarified.

16914 The **<sys/types.h>** header is added as optional (OH); this header need not be included on XSI-
16915 conformant systems.

16916 In the RETURN VALUE section, reference to the setting of *errno* is marked as an extension.

16917 The errors [EIO], [EINTR], [EMFILE], and [ENFILE] are marked as extensions.

16918 A note is added to the APPLICATION USAGE section advising how applications should check
16919 for errors.

16920 The following change is incorporated for alignment with the ISO POSIX-1 standard:

16921 • The type of argument *name* is changed from **char*** to **const char***.

16922 **Issue 5**

16923 Normative text previously in the APPLICATION USAGE section is moved to the RETURN
16924 VALUE section.

16925 The *getgrnam_r*() function is included for alignment with the POSIX Threads Extension.

16926 A note indicating that the *getgrnam*() function need not be reentrant is added to the
16927 DESCRIPTION.

16928 **Issue 6**

16929 The *getgrnam_r*() function is marked as part of the Thread-Safe Functions option. |

16930 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

16931 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

16932 The following new requirements on POSIX implementations derive from alignment with the
16933 Single UNIX Specification:

16934 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
16935 required for conforming implementations of previous POSIX specifications, it was not
16936 required for UNIX applications.

- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

NAME

getgroups — get supplementary group IDs

SYNOPSIS

```
#include <unistd.h>

int getgroups(int gidsetsize, gid_t grouplist[]);
```

DESCRIPTION

The *getgroups*( ) function fills in the array *grouplist* with the current supplementary group IDs of the calling process. It is implementation-defined whether *getgroups*( ) also returns the effective group ID in the *grouplist* array.

The *gidsetsize* argument specifies the number of elements in the array *grouplist*. The actual number of group IDs stored in the array is returned. The values of array entries with indices greater than or equal to the value returned are undefined.

If *gidsetsize* is 0, *getgroups*( ) shall return the number of group IDs that it would otherwise return without modifying the array pointed to by *grouplist*.

If the effective group ID of the process is returned with the supplementary group IDs, the value returned shall always be greater than or equal to one and less than or equal to the value of {NGROUPS_MAX}+1.

RETURN VALUE

Upon successful completion, the number of supplementary group IDs shall be returned. A return value of –1 indicates failure and *errno* shall be set to indicate the error.

ERRORS

The *getgroups*( ) function shall fail if:

[EINVAL] The *gidsetsize* argument is non-zero and less than the number of group IDs that would have been returned.

EXAMPLES

Getting the Supplementary Group IDs of the Calling Process

The following example places the current supplementary group IDs of the calling process into the *group* array.

```
#include <sys/types.h>
#include <unistd.h>
...
gid_t *group;
int nogroups;
long ngroups_max;

ngroups_max = sysconf(_SC_NGROUPS_MAX);
group = (gid_t *)malloc(ngroups_max *sizeof(gid_t));

ngroups = getgroups(ngroups_max, group);
```

APPLICATION USAGE

None.

RATIONALE

The related function *setgroups*( ) is a privileged operation and therefore is not covered by this volume of IEEE Std. 1003.1-200x.

As implied by the definition of supplementary groups, the effective group ID may appear in the array returned by *getgroups*( ) or it may be returned only by *getegid*( ). Duplication may exist, but the application needs to call *getegid*( ) to be sure of getting all of the information. Various implementation variations and administrative sequences cause the set of groups appearing in the result of *getgroups*( ) to vary in order and as to whether the effective group ID is included, even when the set of groups is the same (in the mathematical sense of ''set''). (The history of a process and its parents could affect the details of result.)

Applications writers should note that {NGROUPS_MAX} is not necessarily a constant on all implementations.

FUTURE DIRECTIONS

None.

SEE ALSO

getegid( ), *setgid*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<sys/types.h>**, | **<unistd.h>**

CHANGE HISTORY

First released in Issue 3.

Entry included for alignment with the POSIX.1-1988 standard.

Issue 4

The **<sys/types.h>** header is now marked as optional (OH); this header need not be included on XSI-conformant systems.

The **<unistd.h>** header is added to the SYNOPSIS section.

The following change is incorporated for alignment with the FIPS requirements:

- A return value of 0 is no longer permitted, because {NGROUPS_MAX} cannot be 0.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

Issue 6

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- A return value of 0 is not permitted, because {NGROUPS_MAX} cannot be 0. This is a FIPS requirement.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Explanation added that the effective group ID may be included in the supplementary group list.

17021 **NAME**

17022 gethostbyaddr (**LEGACY**), gethostbyname (**LEGACY**), getipnodebyaddr, getipnodebyname, —
17023 network host database functions

17024 **SYNOPSIS**

17025 ```
#include <netdb.h>

struct hostent *gethostbyaddr(const void *addr, socklen_t len,
    int type);
struct hostent *gethostbyname(const char *name);
struct hostent *getipnodebyaddr(const void *restrict addr, socklen_t len,
    int type, int *restrict error_num);
struct hostent *getipnodebyname(const char *name, int type, int flags,
    int *error_num);
```

17033 **DESCRIPTION**

17034 These functions enable applications to retrieve information about hosts. This information is
17035 considered to be stored in a database that can be accessed sequentially or randomly.
17036 Implementation of this database is unspecified.

17037 **Note:** In many cases it is implemented by the Domain Name System, as documented in
17038 RFC 1034, RFC 1035, and RFC 1886.

17039 Entries are returned in **hostent** structures.

17040 The *gethostbyaddr*( ) function shall return an entry containing addresses of address family *type* for
17041 the host with address *addr*. *len* contains the length of the address pointed to by *addr*. The
17042 *gethostbyaddr*( ) function need not be reentrant. A function that is not required to be reentrant is
17043 not required to be thread-safe.

17044 The *gethostbyname*( ) function shall return an entry containing addresses of address family
17045 AF_INET for the host with name *name*. The *gethostbyname*( ) function need not be reentrant. A
17046 function that is not required to be reentrant is not required to be thread-safe.

17047 The *getipnodebyaddr*( ) function shall return the entry containing addresses of address family *type*
17048 for the host with address *addr*, opening a connection to the database if necessary. The *len*
17049 argument contains the length of the address pointed to by *addr*. If an error occurs, the
17050 appropriate error code is returned in *error_num*. The *getipnodebyaddr*( ) function is thread-safe.

17051 The *getipnodebyname*( ) function shall return the entry containing addresses of address family
17052 *type* for the host with name *name*, opening a connection to the database if necessary. The *flags*
17053 argument affects what information is returned. If an error occurs, the appropriate error code is
17054 returned in *error_num*. The *getipnodebyname*( ) function is thread-safe.

17055 The *addr* argument of *gethostbyaddr*( ) or *getipnodebyaddr*( ) shall be an **in_addr** structure when
17056 IP6 *type* is AF_INET, and shall be an **in6_addr** structure when *type* is AF_INET6. It contains a binary
17057 format (that is, not null-terminated) address in network byte order. The *gethostbyaddr*( ) function
17058 is not guaranteed to return addresses of address families other than AF_INET, even when such
17059 addresses exist in the database.

17060 If *gethostbyaddr*( ) or *getipnodebyaddr*( ) returns a record, then its *h_addrtype* field is the same as the
17061 *type* argument that was passed to the function, and its *h_addr_list* field lists a single address that
17062 IP6 is a copy of the *addr* argument that was passed to the function. If *type* is AF_INET6 and *addr* is
17063 an IPv4-mapped IPv6 address or an IPv4-compatible IPv6 address, then the *h_name* and *h_aliases*
17064 fields are those that would have been returned for address family AF_INET and address equal to
17065 the last four bytes of *addr*.
```

If *gethostbyaddr*( ) or *getipnodebyaddr*( ) are called with *addr* containing the IPv6 unspecified address (all bytes zero), then no query is performed and the function fails with [HOST_NOT_FOUND].

The *name* argument of *getipnodebyname*( ) shall be either a node name or a numeric address string. For IPv4, a numeric address string shall be in the dotted-decimal notation described in *inet_addr*( ). IP6 For IPv6, a numeric address string shall be in one of the standard IPv6 text forms described in *inet_ntop*( ) The *name* argument of *gethostbyname*( ) shall be a node name; the behavior of *gethostbyname*( ) when passed a numeric address string is unspecified.

IP6 If *name* is a dotted-decimal IPv4 address and *af* equals AF_INET, or *name* is an IPv6 hex address and *af* equals AF_INET6, the members of the returned **hostent** structure are as follows:

h_name Points to a copy of the *name* argument.

h_aliases A NULL pointer.

h_addrtype A copy of the *type* argument.

IP6 *h_length* Either 4 (for AF_INET) or 16 (for AF_INET6).

IP6 *h_addr_list*[0] A pointer to the 4-byte or 16-byte binary address.

h_addr_list[1] A NULL pointer.

IP6 If *name* is a dotted-decimal IPv4 address and *af* equals AF_INET6 and AI_V4MAPPED is set in *flags*, an IPv4-mapped IPv6 address is returned, and the members are as follows:

h_name Points to an IPv6 hex address containing the IPv4-mapped IPv6 address.

h_aliases A NULL pointer.

h_addrtype AF_INET6.

h_length 16.

h_addr_list[0] A pointer to the 16-byte binary address.

h_addr_list[1] A NULL pointer.

If *name* is a dotted-decimal IPv4 address and *af* equals AF_INET6 and AI_V4MAPPED is not set, then NULL is returned with [HOST_NOT_FOUND].

It is an error when *name* is an IPv6 hex address and *af* equals AF_INET. The function's return value is a NULL pointer with the [HOST_NOT_FOUND] error.

If *name* is not a numeric address string and is an alias for a valid host name, then *gethostbyname*( ) or *getipnodebyname*( ) return information about the host name to which the alias refers, and *name* is included in the list of aliases returned.

If *name* is a node name, then operation of the *getipnodebyname*( ) function is modified by the value of the *flags* argument, as follows:

- If *flags* is 0 and *type* is AF_INET, then a query is made for IPv4 addresses. If it is successful, the IPv4 addresses are returned and the *h_length* member of the **hostent** structure shall have a value of 4. Otherwise, the function shall return a NULL pointer. IP6

- If *flags* is 0 and if *type* is AF_INET6, then a query is made for IPv6 addresses. If it is successful, the IPv6 addresses are returned and the *h_length* member of the **hostent** structure shall have a value of 16. If unsuccessful, the function shall return a NULL pointer.

- If the AI_V4MAPPED flag is set and *type* is AF_INET6, then a query is made for IPv6 addresses. If it is successful, the IPv6 addresses are returned, and no query is made for IPv4

addresses. If it is not successful, a query is made for IPv4 addresses and any found are returned as IPv4-mapped IPv6 addresses. *h_length* shall have a value of 16 in either case of addresses being returned. The AI_V4MAPPED flag is ignored unless *type* is AF_INET6.

- If the AI_ALL and AI_V4MAPPED flags are both set and *type* is AF_INET6, then a query is made for IPv6 addresses, and any found are returned. Another query is then made for IPv4 addresses, and any found are returned as IPv4-mapped IPv6 addresses, and *h_length* is 16. Only if both queries fail does the function return a NULL pointer. This flag is ignored unless type is AF_INET6.
- The AI_ADDRCONFIG flag specifies that a query for IPv6 addresses should be made only if the node has at least one IPv6 source address configured, and that a query for IPv4 addresses should be made only if the node has at least one IPv4 source address configured.
- If the AI_V4MAPPED and AI_ADDRCONFIG flags are both set and *type* is AF_INET6, then:

  — If the node has at least one IPv6 source address configured, a query is made for IPv6 addresses.

  — If it is successful, the IPv6 addresses are returned and no query is made for IPv4 addresses.

  — If the node has no IPv6 source address configured, or if the query for IPv6 addresses is not successful, then if the node has at least one IPv4 source address configured, a query is made for IPv4 addresses and any found are returned as IPv4-mapped IPv6 addresses.

  h_length shall have a value of 16 in either case of addresses being returned.
- Macro AI_DEFAULT is defined as the logical OR of AI_V4MAPPED and AI_ADDRCONFIG.

Note: It is intended that setting *flags* to AI_DEFAULT be appropriate for most applications.

RETURN VALUE

Upon successful completion, these functions shall return a pointer to a **hostent** structure if the requested entry was found, and a null pointer if the end of the database was reached or the requested entry was not found.

Upon unsuccessful completion, *getipnodebyaddr*( ) and *getipnodebyname*( ) shall set their *error_num* argument to indicate the error, while *gethostbyaddr*( ) and *gethostbyname*( ) shall set *h_errno* to indicate it.

ERRORS

These functions shall fail in the following cases. The *getipnodebyaddr*( ) and *getipnodebyname*( ) functions shall return the value shown in the list below in *error_num*; the *gethostbyaddr*( ) and *gethostbyname*( ) functions shall set *h_errno* to that value. Any changes to *errno* are unspecified.

[HOST_NOT_FOUND]
No such host is known.

[NO_DATA] The server recognized the request and the name, but no address is available. Another type of request to the name server for the domain might return an answer.

[NO_RECOVERY]
An unexpected server failure occurred which cannot be recovered.

[TRY_AGAIN] A temporary and possibly transient error occurred, such as a failure of a server to respond.

17150 **EXAMPLES**

17151 None.

17152 **APPLICATION USAGE**

17153 The **hostent** structure returned by *getipnodebyaddr*( ) and *getipnodebyname*( ), and any structures
17154 pointed to from those structures, are dynamically allocated. Applications should call
17155 *freehostent*( ) to free the memory used by these structures.

17156 The *gethostbyaddr*( ), and *gethostbyname*( ) functions may return pointers to static data, which may
17157 be overwritten by subsequent calls to any of these functions. Applications shall not call
17158 *freehostent*( ) for this area.

17159 The *getipnodebyaddr*( ) function is preferred over the *gethostbyaddr*( ) function.

17160 The *getipnodebyname*( ) function is preferred over the *gethostbyname*( ) function.

17161 **RATIONALE**

17162 None.

17163 **FUTURE DIRECTIONS**

17164 The *gethostbyaddr*( ) and *gethostbyname*( ) functions may be withdrawn in a future version.

17165 **SEE ALSO**

17166 *endhostent*( ), *freehostent*( ), *endservent*( ), *inet_addr*( ), the Base Definitions volume of |

17213 **NAME**

17214 gethostname — get name of current host

17215 **SYNOPSIS**

17216 `#include <unistd.h>`

17217 `int gethostname(char *`*`name`*`, socklen_t `*`namelen`*`);`

17218 **DESCRIPTION**

17219 The *gethostname*( ) function shall return the standard host name for the current machine. The
17220 *namelen* argument shall specify the size of the array pointed to by the *name* argument. The
17221 returned name shall be null-terminated, except that if *namelen* is an insufficient length to hold
17222 the host name, then the returned name shall be truncated and it is unspecified whether the
17223 returned name is null-terminated.

17224 Host names are limited to 255 bytes.

17225 **RETURN VALUE**

17226 Upon successful completion, 0 shall be returned; otherwise, –1 shall be returned.

17227 **ERRORS**

17228 No errors are defined.

17229 **EXAMPLES**

17230 None.

17231 **APPLICATION USAGE**

17232 None.

17253 `struct hostent *getipnodebyname(const char *`*`name`*`, int `*`type`*`, int `*`flags`*`,`
17254 `int *`*`error_num`*`);`

17255 **DESCRIPTION**

17256 Refer to *gethostbyaddr*( ).

NAME

getitimer, setitimer — get or set value of interval timer

SYNOPSIS

XSI

```
#include <sys/time.h>

int getitimer(int which, struct itimerval *value);
int setitimer(int which, const struct itimerval *restrict value,
    struct itimerval *restrict ovalue);
```

DESCRIPTION

The *getitimer*( ) function shall store the current value of the timer specified by *which* into the structure pointed to by *value*. The *setitimer*( ) function shall set the timer specified by *which* to the value specified in the structure pointed to by *value*, and if *ovalue* is not a null pointer, stores the previous value of the timer in the structure pointed to by *ovalue*.

A timer value is defined by the **itimerval** structure, specified in **<sys/time.h>**. If *it_value* is non-zero, it shall indicate the time to the next timer expiration. If *it_interval* is non-zero, it shall specify a value to be used in reloading *it_value* when the timer expires. Setting *it_value* to 0 shall disable a timer, regardless of the value of *it_interval*. Setting *it_interval* to 0 shall disable a timer after its next expiration (assuming *it_value* is non-zero).

Implementations may place limitations on the granularity of timer values. For each interval timer, if the requested timer value requires a finer granularity than the implementation supports, the actual timer value shall be rounded up to the next supported value.

An XSI-conforming implementation provides each process with at least three interval timers, which are indicated by the *which* argument:

ITIMER_REAL — Decrements in real time. A SIGALRM signal is delivered when this timer expires.

ITIMER_VIRTUAL — Decrements in process virtual time. It runs only when the process is executing. A SIGVTALRM signal is delivered when it expires.

ITIMER_PROF — Decrements both in process virtual time and when the system is running on behalf of the process. It is designed to be used by interpreters in statistically profiling the execution of interpreted programs. Each time the ITIMER_PROF timer expires, the SIGPROF signal is delivered.

The interaction between *setitimer*( ) and any of *alarm*( ), *sleep*( ), or *usleep*( ) is unspecified.

RETURN VALUE

Upon successful completion, *getitimer*( ) or *setitimer*( ) shall return 0; otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *setitimer*( ) function shall fail if:

[EINVAL] The *value* argument is not in canonical form. (In canonical form, the number of microseconds is a non-negative integer less than 1,000,000 and the number of seconds is a non-negative integer.)

The *getitimer*( ) and *setitimer*( ) functions may fail if:

[EINVAL] The *which* argument is not recognized.

17299 **EXAMPLES**

17300 None.

17314 **Issue 6** |

17315 The **restrict** keyword is added to the *setitimer*( ) prototype for alignment with the |
17316 ISO/IEC 9899:1999 standard. |

17317 **NAME**

17318 getlogin, getlogin_r — get login name

17319 **SYNOPSIS**

17320 `#include <unistd.h>`

17321 `char *getlogin(void);`

17322 TSF `int getlogin_r(char *`*`name`*`, size_t `*`namesize`*`);`

17323

17324 **DESCRIPTION**

17325 The *getlogin*( ) function shall return a pointer to a string containing the user name associated by
17326 the login activity with the controlling terminal of the current process. If *getlogin*( ) returns a non-
17327 null pointer, then that pointer points to the name that the user logged in under, even if there are
17328 several login names with the same user ID.

17329 The *getlogin*( ) function need not be reentrant. A function that is not required to be reentrant is
17330 not required to be thread-safe.

17331 TSF The *getlogin_r*( ) function puts the name associated by the login activity with the controlling
17332 terminal of the current process in the character array pointed to by *name*. The array is *namesize*
17333 characters long and should have space for the name and the terminating null character. The
17334 maximum size of the login name is {LOGIN_NAME_MAX}.

17335 If *getlogin_r*( ) is successful, *name* points to the name the user used at login, even if there are
17336 several login names with the same user ID.

17337 **RETURN VALUE**

17338 Upon successful completion, *getlogin*( ) shall return a pointer to the login name or a null pointer
17339 if the user's login name cannot be found. Otherwise, it shall return a null pointer and set *errno* to
17340 indicate the error.

17341 The return value from *getlogin*( ) may point to static data whose content is overwritten by each
17342 call.

17343 TSF If successful, the *getlogin_r*( ) function shall return zero; otherwise, an error number shall be
17344 returned to indicate the error.

17345 **ERRORS**

17346 The *getlogin*( ) and *getlogin_r*( ) functions may fail if:

17347 [EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

17348 [ENFILE] The maximum allowable number of files is currently open in the system.

17349 [ENXIO] The calling process has no controlling terminal.

17350 The *getlogin_r*( ) function may fail if:

17351 TSF [ERANGE] The value of *namesize* is smaller than the length of the string to be returned
17352 including the terminating null character.

EXAMPLES

Getting the User Login Name

The following example calls the *getlogin*( ) function to obtain the name of the user associated with the calling process, and passes this information to the *getpwnam*( ) function to get the associated user database information.

```
#include <unistd.h>
#include <sys/types.h>
#include <pwd.h>
#include <stdio.h>
...
char *lgn;
struct passwd *pw;
...
if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
    fprintf(stderr, "Get of user information failed.\n"); exit(1);
    }
```

APPLICATION USAGE

Three names associated with the current process can be determined: *getpwuid*(*geteuid*( )) shall return the name associated with the effective user ID of the process; *getlogin*( ) shall return the name associated with the current login activity; and *getpwuid*(*getuid*( )) shall return the name associated with the real user ID of the process.

The *getlogin_r*( ) function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

The *getlogin*( ) function returns a pointer to the user's login name. The same user ID may be shared by several login names. If it is desired to get the user database entry that is used during login, the result of *getlogin*( ) should be used to provide the argument to the *getpwnam*( ) function. (This might be used to determine the user's login shell, particularly where a single user has multiple login shells with distinct login names, but the same user ID.)

The information provided by the *cuserid*( ) function, which was originally defined in the POSIX.1-1988 standard and subsequently removed, can be obtained by the following:

```
getpwuid(geteuid())
```

while the information provided by historical implementations of *cuserid*( ) can be obtained by:

```
getpwuid(getuid())
```

The thread-safe version of this function places the user name in a user-supplied buffer and returns a non-zero value if it fails. The non-thread-safe version may return the name in a static data area that may be overwritten by each call.

FUTURE DIRECTIONS

None.

SEE ALSO

getpwnam( ), *getpwuid*( ), *geteuid*( ), *getuid*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<limits.h>**, **<unistd.h>**

17395 **CHANGE HISTORY**

17396 First released in Issue 1. Derived from System V Release 2.0.

17397 **Issue 4**

17398 The **<unistd.h>** header is added to the SYNOPSIS section.

17399 In the RETURN VALUE section, reference to the setting of *errno* is marked as an extension.

17400 The behavior of the function when the login name cannot be found is included in the RETURN
17401 VALUE section instead of the DESCRIPTION.

17402 The errors [EMFILE], [ENFILE], and [ENXIO] are marked as extensions.

17403 The APPLICATION USAGE section is changed to refer to *getpwuid*( ) rather than *cuserid*( ), which
17404 may be withdrawn in a future version.

17405 The following changes are incorporated for alignment with the ISO POSIX-1 standard:

17406 - The argument list is explicitly defined as **void**.

17407 - The DESCRIPTION is updated to state explicitly that the return value is a pointer to a string
17408 giving the user name, rather than simply a pointer to the user name as stated in previous
17409 issues.

17410 **Issue 5**

17411 Normative text previously in the APPLICATION USAGE section is moved to the RETURN
17412 VALUE section.

17413 The *getlogin_r*( ) function is included for alignment with the POSIX Threads Extension.

17414 A note indicating that the *getlogin*( ) function need not be reentrant is added to the
17415 DESCRIPTION.

17416 **Issue 6**

17417 The *getlogin_r*( ) function is marked as part of the Thread-Safe Functions option.

17418 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

17419 The following new requirements on POSIX implementations derive from alignment with the
17420 Single UNIX Specification:

17421 - In the RETURN VALUE section, the requirement to set *errno* on error is added.

17422 - The [EMFILE], [ENFILE], and [ENXIO] optional error conditions are added.

17423 The APPLICATION USAGE section is updated to include a note on the thread-safe function and
17424 its avoidance of possibly using a static data area.

17425 **NAME**

17426 getmsg, getpmsg — receive next message from a STREAMS file (**STREAMS**)

17427 **SYNOPSIS**

17428 XSR
```
#include <stropts.h>

int getmsg(int fildes, struct strbuf *restrict ctlptr,
    struct strbuf *restrict dataptr, int *restrict flagsp);
int getpmsg(int fildes, struct strbuf *restrict ctlptr,
    struct strbuf *restrict dataptr, int *restrict bandp,
    int *restrict flagsp);
```

17435 **DESCRIPTION**

17436 The *getmsg*( ) function shall retrieve the contents of a message located at the head of the
17437 STREAM head read queue associated with a STREAMS file and place the contents into one or
17438 more buffers. The message contains either a data part, a control part, or both. The data and
17439 control parts of the message are placed into separate buffers, as described below. The semantics
17440 of each part are defined by the originator of the message.

17441 The *getpmsg*( ) function does the same thing as *getmsg*( ), but provides finer control over the
17442 priority of the messages received. Except where noted, all requirements on *getmsg*( ) also pertain
17443 to *getpmsg*( ).

17444 The *fildes* argument specifies a file descriptor referencing a STREAMS-based file.

17445 The *ctlptr* and *dataptr* arguments each point to a **strbuf** structure, in which the *buf* member points
17446 to a buffer in which the data or control information is to be placed, and the *maxlen* member
17447 indicates the maximum number of bytes this buffer can hold. On return, the *len* member
17448 contains the number of bytes of data or control information actually received. The *len* member is
17449 set to 0 if there is a zero-length control or data part and *len* is set to –1 if no data or control
17450 information is present in the message.

17451 When *getmsg*( ) is called, *flagsp* should point to an integer that indicates the type of message the
17452 process is able to receive. This is described further below.

17453 The *ctlptr* argument is used to hold the control part of the message, and *dataptr* is used to hold
17454 the data part of the message. If *ctlptr* (or *dataptr*) is a null pointer or the *maxlen* member is –1, the
17455 control (or data) part of the message is not processed and is left on the STREAM head read
17456 queue, and if the *ctlptr* (or *dataptr*) is not a null pointer, *len* is set to –1. If the *maxlen* member is
17457 set to 0 and there is a zero-length control (or data) part, that zero-length part is removed from
17458 the read queue and *len* is set to 0. If the *maxlen* member is set to 0 and there are more than 0 bytes
17459 of control (or data) information, that information is left on the read queue and *len* is set to 0. If
17460 the *maxlen* member in *ctlptr* (or *dataptr*) is less than the control (or data) part of the message,
17461 *maxlen* bytes are retrieved. In this case, the remainder of the message is left on the STREAM head
17462 read queue and a non-zero return value is provided.

17463 By default, *getmsg*( ) processes the first available message on the STREAM head read queue.
17464 However, a process may choose to retrieve only high-priority messages by setting the integer
17465 pointed to by *flagsp* to RS_HIPRI. In this case, *getmsg*( ) shall only process the next message if it is
17466 a high-priority message. When the integer pointed to by *flagsp* is 0, any message shall be
17467 retrieved. In this case, on return, the integer pointed to by *flagsp* is set to RS_HIPRI if a high-
17468 priority message was retrieved, or 0 otherwise.

17469 For *getpmsg*( ), the flags are different. The *flagsp* argument points to a bitmask with the following
17470 mutually-exclusive flags defined: MSG_HIPRI, MSG_BAND, and MSG_ANY. Like *getmsg*( ),
17471 *getpmsg*( ) processes the first available message on the STREAM head read queue. A process may

choose to retrieve only high-priority messages by setting the integer pointed to by *flagsp* to MSG_HIPRI and the integer pointed to by *bandp* to 0. In this case, *getpmsg*( ) shall only process the next message if it is a high-priority message. In a similar manner, a process may choose to retrieve a message from a particular priority band by setting the integer pointed to by *flagsp* to MSG_BAND and the integer pointed to by *bandp* to the priority band of interest. In this case, *getpmsg*( ) shall only process the next message if it is in a priority band equal to, or greater than, the integer pointed to by *bandp*, or if it is a high-priority message. If a process just wants to get the first message off the queue, the integer pointed to by *flagsp* should be set to MSG_ANY and the integer pointed to by *bandp* should be set to 0. On return, if the message retrieved was a high-priority message, the integer pointed to by *flagsp* is set to MSG_HIPRI and the integer pointed to by *bandp* shall be set to 0. Otherwise, the integer pointed to by *flagsp* shall be set to MSG_BAND and the integer pointed to by *bandp* shall be set to the priority band of the message.

If O_NONBLOCK is not set, *getmsg*( ) and *getpmsg*( ) shall block until a message of the type specified by *flagsp* is available at the front of the STREAM head read queue. If O_NONBLOCK is set and a message of the specified type is not present at the front of the read queue, *getmsg*( ) and *getpmsg*( ) shall fail and set *errno* to [EAGAIN].

If a hangup occurs on the STREAM from which messages are retrieved, *getmsg*( ) and *getpmsg*( ) continue to operate normally, as described above, until the STREAM head read queue is empty. Thereafter, they return 0 in the *len* members of *ctlptr* and *dataptr*.

RETURN VALUE

Upon successful completion, *getmsg*( ) and *getpmsg*( ) shall return a non-negative value. A value of 0 indicates that a full message was read successfully. A return value of MORECTL indicates that more control information is waiting for retrieval. A return value of MOREDATA indicates that more data is waiting for retrieval. A return value of the bitwise-logical OR of MORECTL and MOREDATA indicates that both types of information remain. Subsequent *getmsg*( ) and *getpmsg*( ) calls shall retrieve the remainder of the message. However, if a message of higher priority has come in on the STREAM head read queue, the next call to *getmsg*( ) or *getpmsg*( ) shall retrieve that higher-priority message before retrieving the remainder of the previous message.

If the high priority control part of the message is consumed, the message shall be placed back on the queue as a normal message of band 0. Subsequent *getmsg*( ) and *getpmsg*( ) calls shall retrieve the remainder of the message. If, however, a priority message arrives or already exists on the STREAM head, the subsequent call to *getmsg*( ) or *getpmsg*( ) retrieves the higher-priority message before retrieving the remainder of the message that was put back.

Upon failure, *getmsg*( ) and *getpmsg*( ) shall return –1 and set *errno* to indicate the error.

ERRORS

The *getmsg*( ) and *getpmsg*( ) functions shall fail if:

[EAGAIN] The O_NONBLOCK flag is set and no messages are available.

[EBADF] The *fildes* argument is not a valid file descriptor open for reading.

[EBADMSG] The queued message to be read is not valid for *getmsg*( ) or *getpmsg*( ) or a pending file descriptor is at the STREAM head.

[EINTR] A signal was caught during *getmsg*( ) or *getpmsg*( ).

[EINVAL] An illegal value was specified by *flagsp*, or the STREAM or multiplexer referenced by *fildes* is linked (directly or indirectly) downstream from a multiplexer.

17517 [ENOSTR] A STREAM is not associated with *fildes*.

17518 In addition, *getmsg*( ) and *getpmsg*( ) shall fail if the STREAM head had processed an
17519 asynchronous error before the call. In this case, the value of *errno* does not reflect the result of
17520 *getmsg*( ) or *getpmsg*( ) but reflects the prior error.

17521 **EXAMPLES**

17522 **Getting Any Message**

17523 In the following example, the value of *fd* is assumed to refer to an open STREAMS file. The call
17524 to *getmsg*( ) retrieves any available message on the associated STREAM-head read queue,
17525 returning control and data information to the buffers pointed to by *ctrlbuf* and *databuf*,
17526 respectively.

```
17527 #include <stropts.h>
17528 ...
17529 int fd;
17530 char ctrlbuf[128];
17531 char databuf[512];
17532 struct strbuf ctrl;
17533 struct strbuf data;
17534 int flags = 0;
17535 int ret;

17536 ctrl.buf = ctrlbuf;
17537 ctrl.maxlen = sizeof(ctrlbuf);

17538 data.buf = databuf;
17539 data.maxlen = sizeof(databuf);

17540 ret = getmsg (fd, &ctrl, &data, &flags);
```

17541 **Getting the First Message off the Queue**

17542 In the following example, the call to *getpmsg*( ) retrieves the first available message on the
17543 associated STREAM-head read queue.

```
17544 #include <stropts.h>
17545 ...

17546 int fd;
17547 char ctrlbuf[128];
17548 char databuf[512];
17549 struct strbuf ctrl;
17550 struct strbuf data;
17551 int band = 0;
17552 int flags = MSG_ANY;
17553 int ret;

17554 ctrl.buf = ctrlbuf;
17555 ctrl.maxlen = sizeof(ctrlbuf);

17556 data.buf = databuf;
17557 data.maxlen = sizeof(databuf);

17558 ret = getpmsg (fd, &ctrl, &data, &band, &flags);
```

17570 **Issue 5**

17571 Moved from X/OPEN UNIX extension to BASE.

17572 A paragraph regarding ‘‘high-priority control parts of messages’’ is added to the RETURN
17573 VALUE section.

17574 **Issue 6**

17575 This function is marked as part of the XSI STREAMS Option Group. |

17576 The **restrict** keyword is added to the *getmsg*( ) and *getpmsg*( ) prototypes for alignment with the |
17577 ISO/IEC 9899:1999 standard. |

17578 **NAME**

17579 getnameinfo — get name information

17580 ***Notes to Reviewers***

17581 *This section with side shading will not appear in the final copy. - Ed.*

17582 The IPv6 developers believe that *getnameinfo*( ) should not truncate the result if the user buffer is
17583 too small, but return an error status.

17584 **SYNOPSIS**

```
17585       #include <sys/socket.h>
17586       #include <netdb.h>

17587       int getnameinfo(const struct sockaddr *restrict sa, socklen_t salen,
17588           char *restrict node, socklen_t nodelen, char *restrict service,
17589           socklen_t servicelen, unsigned flags);
```

17590 **DESCRIPTION**

17591 The *getnameinfo*( ) function translates a socket address to a node name and service location, all of
17592 which are defined as in *getaddrinfo*( ).

17593 The *sa* argument points to a socket address structure to be translated.

17594 If the *node* argument is non-NULL and the *nodelen* argument is non-zero, then the *node* argument
17595 points to a buffer able to contain up to *nodelen* characters that receives the node name as a null-
17596 terminated string. If the *node* argument is NULL or the *nodelen* argument is zero, the node name
17597 shall not be returned. If the node's name cannot be located, the numeric form of the node's
17598 address is returned instead of its name.

17599 If the *service* argument is non-NULL and the *servicelen* argument is non-zero, then the *service*
17600 argument points to a buffer able to contain up to *servicelen* characters that receives the service
17601 name as a null-terminated string. If the *service* argument is NULL or the *servicelen* argument is
17602 zero, the service name shall not be returned. If the service's name cannot be located, the numeric
17603 form of the service address (for example, its port number) is returned instead of its name.

17604 The *node* and *service* arguments cannot both be NULL.

17605 The *flags* argument is a flag that changes the default actions of the function. By default the fully-
17606 qualified domain name (FQDN) for the host is returned, but:

17607 • If the flag bit NI_NOFQDN is set, only the node name portion of the FQDN shall be returned
17608 for local hosts.

17609 • If the flag bit NI_NUMERICHOST is set, the numeric form of the host's address shall be
17610 returned instead of its name, under all circumstances.

17611 • If the flag bit NI_NAMEREQD is set, an error shall be returned if the host's name cannot be
17612 located.

17613 • If the flag bit NI_NUMERICSERV is set, the numeric form of the service address shall be
17614 returned (for example, its port number) instead of its name, under all circumstances.

17615 • If the flag bit NI_DGRAM is set, this indicates that the service is a datagram service
17616 (SOCK_DGRAM). The default behavior shall assume that the service is a stream service
17617 (SOCK_STREAM).

17618 **Notes:**

17619 1. The two NI_NUMERICxxx flags are required to support the **–n** flag that many
17620 commands provide.

2. The NI_DGRAM flag is required for the few AF_INET and AF_INET6 port numbers (for example, 512-514) that represent different services for UDP and TCP.

The *getnameinfo*( ) function shall be thread-safe.

RETURN VALUE

A zero return value for *getnameinfo*( ) indicates successful completion; a non-zero return value indicates failure. The possible values for the failures are listed in the ERRORS section.

Upon successful completion, *getnameinfo*( ) shall return the *node* and *service* names, if requested, in the buffers provided. The returned names are always null-terminated strings, and may be truncated if the actual values are longer than can be stored in the buffers provided.

ERRORS

The *getnameinfo*( ) function shall fail and return the corresponding value if:

[EAI_AGAIN] The name could not be resolved at this time. Future attempts may succeed.

[EAI_BADFLAGS] The *flags* had an invalid value.

[EAI_FAIL] A non-recoverable error occurred.

[EAI_FAMILY] The address family was not recognized or the address length was invalid for the specified family.

[EAI_MEMORY] There was a memory allocation failure.

[EAI_NONAME] The name does not resolve for the supplied parameters.

NI_NAMEREQD is set and the host's name cannot be located, or both *nodename* and *servname* were null.

[EAI_SYSTEM] A system error occurred. The error code can be found in *errno*.

EXAMPLES

None.

APPLICATION USAGE

If the returned values are to be used as part of any further name resolution (for example, passed to *getaddrinfo*( )), applications shall either provide buffers large enough to store any result possible on the system or shall check for truncation and handle that case appropriately.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the *getnameinfo*( ) prototype for alignment with the ISO/IEC 9899:1999 standard.

17661 **NAME**

17662 getnetbyaddr — network database functions

17663 **SYNOPSIS**

17664 `#include <netdb.h>`

17665 `struct netent *getnetbyaddr(uint32_t net, int type);`

17666 **DESCRIPTION**

17667 Refer to *endnetent*( ).

17668 **NAME**

17669 getnetbyname — network database functions

17670 **SYNOPSIS**

17671 `#include <netdb.h>`

17672 `struct netent *getnetbyname(const char *`*`name`*`);`

17673 **DESCRIPTION**

17674 Refer to *endnetent*( ).

17675 **NAME**

17676 getnetent — network database functions

17677 **SYNOPSIS**

17678 `#include <netdb.h>`

17679 `struct netent *getnetent(void);`

17680 **DESCRIPTION**

17681 Refer to *endnetent*( ).

17682 **NAME**

17683 getopt, optarg, opterr, optind, optopt — command option parsing

17684 **SYNOPSIS**

17685 ```
#include <unistd.h>
```

17686 ```
int getopt(int argc, char * const argv[], const char *optstring);
```
17687 ```
extern char *optarg;
```
17688 ```
extern int optind, opterr, optopt;
```

17689 **DESCRIPTION**

17690 The *getopt*( ) function is a command-line parser that can be used by applications that follow
17691 Utility Syntax Guidelines 3, 4, 5, 6, 7, 9, and 10 in the Base Definitions volume of
17692 IEEE Std. 1003.1-200x, Section 12.2, Utility Syntax Guidelines. The remaining guidelines are not
17693 addressed by *getopt*( ) and are the responsibility of the application.

17694 The parameters *argc* and *argv* are the argument count and argument array as passed to *main*( )
17695 (see *exec*). The argument *optstring* is a string of recognized option characters; if a character is
17696 followed by a colon, the option takes an argument. All option characters allowed by Utility
17697 Syntax Guideline 3 are allowed in *optstring*. The implementation may accept other characters as
17698 an extension.

17699 The variable *optind* is the index of the next element of the *argv*[ ] vector to be processed. It is
17700 initialized to 1 by the system, and *getopt*( ) updates it when it finishes with each element of
17701 *argv*[ ]. When an element of *argv*[ ] contains multiple option characters, it is unspecified how
17702 *getopt*( ) determines which options have already been processed.

17703 The *getopt*( ) function shall return the next option character (if one is found) from *argv* that
17704 matches a character in *optstring*, if there is one that matches. If the option takes an argument,
17705 *getopt*( ) shall set the variable *optarg* to point to the option-argument as follows:

17706 1. If the option was the last character in the string pointed to by an element of *argv*, then
17707 *optarg* contains the next element of *argv*, and *optind* is incremented by 2. If the resulting
17708 value of *optind* is greater than *argc*, this indicates a missing option-argument, and *getopt*( )
17709 shall return an error indication.

17710 2. Otherwise, *optarg* points to the string following the option character in that element of
17711 *argv*, and *optind* is incremented by 1.

17712 If, when *getopt*( ) is called:

17713 ```
argv[optind]
```  is a null pointer
17714 ```
*argv[optind]
```  is not the character –
17715 ```
argv[optind]
```  points to the string "–"

17716 *getopt*( ) shall return –1 without changing *optind*. If:

17717 ```
argv[optind]
```  points to the string "––"

17718 *getopt*( ) shall return –1 after incrementing *optind*.

17719 If *getopt*( ) encounters an option character that is not contained in *optstring*, it shall return the
17720 question-mark (`'?'`) character. If it detects a missing option-argument, it shall return the colon
17721 character (`':'`) if the first character of *optstring* was a colon, or a question-mark character (`'?'`)
17722 otherwise. In either case, *getopt*( ) shall set the variable *optopt* to the option character that caused
17723 the error. If the application has not set the variable *opterr* to 0 and the first character of *optstring*
17724 is not a colon, *getopt*( ) shall also print a diagnostic message to *stderr* in the format specified for
17725 the *getopts* utility.

The *getopt*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

## RETURN VALUE

The *getopt*( ) function shall return the next option character specified on the command line.

A colon (':') shall be returned if *getopt*( ) detects a missing argument and the first character of *optstring* was a colon (':').

A question mark ('?') shall be returned if *getopt*( ) encounters an option character not in *optstring* or detects a missing argument and the first character of *optstring* was not a colon (':').

Otherwise, *getopt*( ) shall return –1 when all command line options are parsed.

## ERRORS

No errors are defined.

## EXAMPLES

### Parsing Command Line Options

The following code fragment shows how you might process the arguments for a utility that can take the mutually-exclusive options *a* and *b* and the options *f* and *o*, both of which require arguments:

```
#include <unistd.h>

int
main(int argc, char *argv[ ])
{
    int c;
    int bflg, aflg, errflg;
    char *ifile;
    char *ofile;
    extern char *optarg;
    extern int optind, optopt;
    . . .
    while ((c = getopt(argc, argv, ":abf:o:")) != -1) {
        switch(c) {
        case 'a':
            if (bflg)
                errflg++;
            else
                aflg++;
            break;
        case 'b':
            if (aflg)
                errflg++;
            else {
                bflg++;
                bproc();
            }
            break;
        case 'f':
            ifile = optarg;
            break;
        case 'o':
```

```
                ofile = optarg;
                break;
                case ':':       /* -f or -o without operand */
                        fprintf(stderr,
                                "Option -%c requires an operand\n", optopt);
                        errflg++;
                        break;
            case '?':
                        fprintf(stderr,
                                "Unrecognized option: -%c\n", optopt);
                errflg++;
            }
        }
        if (errflg) {
            fprintf(stderr, "usage: . . . ");
            exit(2);
        }
        for ( ; optind < argc; optind++) {
            if (access(argv[optind], R_OK)) {
        . . .
    }
```

This code accepts any of the following as equivalent:

```
cmd –ao arg path path
cmd –a –o arg path path
cmd –o arg –a path path
cmd –a –o arg –– path path
cmd –a –oarg path path
cmd –aoarg path path
```

Checking Options and Arguments

The following example parses a set of command line options and prints messages to standard output for each option and argument that it encounters.

```
#include <unistd.h>
#include <stdio.h>
...
int c;
char *filename;
extern char *optarg;
extern int optind, optopt, opterr;
...
while ((c = getopt(argc, argv, ":abf:")) != -1) {
    switch(c) {
    case 'a':
        printf("a is set\n");
        break;
    case 'b':
        printf("b is set\n");
        break;
    case 'f':
        filename = optarg;
```

```
            printf("filename is %s\n", filename);
            break;
        case ':':
            printf("-%c without filename\n", optopt);
            break;
        case '?':
            printf("unknown arg %c\n", optopt);
            break;
        }
    }
```

Selecting Options from the Command Line

The following example selects the type of database routines the user wants to use based on the *Options* argument.

```
#include <unistd.h>
#include <string.h>
...
char *Options = "hdbtl";
...
int dbtype, i;
char c;
char *st;
...
dbtype = 0;
while ((c = getopt(argc, argv, Options)) != -1) {
    if ((st = strchr(Options, c)) != NULL) {
        dbtype = st - Options;
        break;
    }
}
```

APPLICATION USAGE

The *getopt*( ) function is only required to support option characters included in Utility Syntax Guideline 3. Many historical implementations of *getopt*( ) support other characters as options. This is an allowed extension, but applications that use extensions are not maximally portable. Note that support for multi-byte option characters is only possible when such characters can be represented as type **int**.

RATIONALE

The *optopt* variable represents historical practice and allows the application to obtain the identity of the invalid option.

The description has been written to make it clear that *getopt*( ), like the *getopts* utility, deals with option-arguments whether separated from the option by <blank> characters or not. Note that the requirements on *getopt*( ) and *getopts* are more stringent than the Utility Syntax Guidelines.

The *getopt*( ) function shall return –1, rather than EOF, so that **<stdio.h>** is not required.

The special significance of a colon as the first character of *optstring* makes *getopt*( ) consistent with the *getopts* utility. It allows an application to make a distinction between a missing argument and an incorrect option letter without having to examine the option letter. It is true that a missing argument can only be detected in one case, but that is a case that has to be considered.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 4

The following changes are incorporated for alignment with the ISO POSIX-2 standard:

- The **<unistd.h>** header is added to the SYNOPSIS section and **<stdio.h>** is deleted.
- The type of argument *argv* is changed from **char**** to **char*const**[ ].
- The integer *optopt* is added to the list of external data items.
- The DESCRIPTION is largely rewritten, without functional change, for alignment with the ISO POSIX-2 standard, although the following differences should be noted:
  - If the function detects a missing option-argument, it returns a colon (':') and sets *optopt* to the option character.
  - The termination conditions under which *getopt*( ) returns –1 are extended. Also note that the termination condition is explicitly –1, rather than the value of EOF.
- The EXAMPLES section is changed to illustrate the new functionality.

Issue 5

A note indicating that the *getopt*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

IEEE PASC Interpretation 1003.2 #150 is applied.

17892 **NAME**

17893 getpeername — get the name of the peer socket

17894 **SYNOPSIS**

17895 `#include <sys/socket.h>`

17896 `int getpeername(int socket, struct sockaddr *restrict address,`
17897 `socklen_t *address_len);`

17898 **DESCRIPTION**

17899 The *getpeername*( ) function shall retrieve the peer address of the specified socket, store this
17900 address in the **sockaddr** structure pointed to by the *address* argument, and store the length of this
17901 address in the object pointed to by the *address_len* argument.

17902 If the actual length of the address is greater than the length of the supplied **sockaddr** structure,
17903 the stored address shall be truncated.

17904 If the protocol permits connections by unbound clients, and the peer is not bound, then the value
17905 stored in the object pointed to by *address* is unspecified.

17906 **RETURN VALUE**

17907 Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to
17908 indicate the error.

17909 **ERRORS**

17910 The *getpeername*( ) function shall fail if:

17911 [EBADF] The *socket* argument is not a valid file descriptor.

17912 [EINVAL] The socket has been shut down.

17913 [ENOTCONN] The socket is not connected or otherwise has not had the peer prespecified.

17914 [ENOTSOCK] The *socket* argument does not refer to a socket.

17915 [EOPNOTSUPP] The operation is not supported for the socket protocol.

17916 The *getpeername*( ) function may fail if:

17917 [ENOBUFS] Insufficient resources were available in the system to complete the call.

17918 **EXAMPLES**

17919 None.

17920 **APPLICATION USAGE**

17921 None.

17922 **RATIONALE**

17923 None.

17924 **FUTURE DIRECTIONS**

17929 **CHANGE HISTORY**

17930 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

17931 The **restrict** keyword is added to the *getpeername*( ) prototype for alignment with the
17932 ISO / IEC 9899: 1999 standard.

NAME

getpgid — get the process group ID for a process

SYNOPSIS

XSI
```
#include <unistd.h>

pid_t getpgid(pid_t pid);
```

DESCRIPTION

The *getpgid*( ) function shall return the process group ID of the process whose process ID is equal to *pid*. If *pid* is equal to 0, *getpgid*( ) shall return the process group ID of the calling process.

RETURN VALUE

Upon successful completion, *getpgid*( ) shall return a process group ID. Otherwise, it shall return (**pid_t**)–1 and set *errno* to indicate the error.

ERRORS

The *getpgid*( ) function shall fail if:

[EPERM] The process whose process ID is equal to *pid* is not in the same session as the calling process, and the implementation does not allow access to the process group ID of that process from the calling process.

[ESRCH] There is no process with a process ID equal to *pid*.

The *getpgid*( ) function may fail if:

[EINVAL] The value of the *pid* argument is invalid.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

exec, *fork*( ), *getpgrp*( ), *getpid*( ), *getsid*( ), *setpgid*( ), *setsid*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<unistd.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

17968 **NAME**

17969 getpgrp — get the process group ID of the calling process

17970 **SYNOPSIS**

17971 `#include <unistd.h>`

17972 `pid_t getpgrp(void);`

17973 **DESCRIPTION**

17974 The *getpgrp*( ) function shall return the process group ID of the calling process.

17975 **RETURN VALUE**

17976 The *getpgrp*( ) function is always successful and no return value is reserved to indicate an error.

17977 **ERRORS**

17978 No errors are defined.

17979 **EXAMPLES**

17980 None.

17981 **APPLICATION USAGE**

17982 None.

17983 **RATIONALE**

17984 4.3 BSD provides a *getpgrp*( ) function that returns the process group ID for a specified process.
17985 Although this function is used to support job control, all known job control shells always specify
17986 the calling process with this function. Thus, the simpler System V *getpgrp*( ) suffices, and the
17987 added complexity of the 4.3 BSD *getpgrp*( ) has been omitted from this volume of
17988 IEEE Std. 1003.1-200x.

17989 **FUTURE DIRECTIONS**

17990 None.

17991 **SEE ALSO**

17992 *exec*, *fork*( ), *getpgid*( ), *getpid*( ), *getppid*( ), *kill*( ), *setpgid*( ), *setsid*( ), the Base Definitions volume of
17993 IEEE Std. 1003.1-200x, **<sys/types.h>**, **<unistd.h>**

17994 **CHANGE HISTORY**

17995 First released in Issue 1. Derived from Issue 1 of the SVID.

17996 **Issue 4**

17997 The **<sys/types.h>** header is now marked as optional (OH); this header need not be included on
17998 XSI-conformant systems.

17999 The **<unistd.h>** header is added to the SYNOPSIS section.

18000 The following change is incorporated for alignment with the ISO POSIX-1 standard:

18001 - The argument list is explicitly defined as **void**.

18002 **Issue 6**

18003 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

18004 The following new requirements on POSIX implementations derive from alignment with the
18005 Single UNIX Specification:

18006 - The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
18007 required for conforming implementations of previous POSIX specifications, it was not
18008 required for UNIX applications.

18009 **NAME**

18010 getpid — get the process ID

18011 **SYNOPSIS**

18012
```
#include <unistd.h>
```

18013
```
pid_t getpid(void);
```

18014 **DESCRIPTION**

18015 The *getpid*( ) function shall return the process ID of the calling process.

18016 **RETURN VALUE**

18017 The *getpid*( ) function is always successful and no return value is reserved to indicate an error.

18018 **ERRORS**

18019 No errors are defined.

18020 **EXAMPLES**

18021 None.

18022 **APPLICATION USAGE**

18023 None.

18024 **RATIONALE**

18025 None.

18026 **FUTURE DIRECTIONS**

18027 None.

18086 **Issue 6**

18087 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

18088 The following new requirements on POSIX implementations derive from alignment with the
18089 Single UNIX Specification:

18090 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
18091 required for conforming implementations of previous POSIX specifications, it was not
18092 required for UNIX applications.

18093 **NAME**

18094 getpriority, setpriority — get or set the nice value

18095 **SYNOPSIS**

18096 XSI
```
#include <sys/resource.h>

int getpriority(int which, id_t who);
int setpriority(int which, id_t who, int value);
```
18099

18100 **DESCRIPTION**

18101 The *getpriority*( ) function obtains the nice value of a process, process group, or user. The
18102 *setpriority*( ) function sets the nice value of a process, process group, or user to *value*+ {NZERO}.

18103 Target processes are specified by the values of the *which* and *who* arguments. The *which*
18104 argument may be one of the following values: PRIO_PROCESS, PRIO_PGRP, or PRIO_USER,
18105 indicating that the *who* argument is to be interpreted as a process ID, a process group ID, or an
18106 effective user ID, respectively. A 0 value for the *who* argument specifies the current process,
18107 process group, or user.

18108 The nice value set with *setpriority*( ) shall be applied to the process. If the process is multi-
18109 threaded, the nice value shall affect all system scope threads in the process.

18110 If more than one process is specified, *getpriority*( ) shall return value {NZERO} less than the
18111 lowest nice value pertaining to any of the specified processes, and *setpriority*( ) sets the nice
18112 values of all of the specified processes to *value*+ {NZERO}.

18113 The default nice value is {NZERO}; lower nice values cause more favorable scheduling. While
18114 the range of valid nice values is [0,{NZERO}*2 –1], implementations may enforce more
18115 restrictive limits. If *value*+ {NZERO} is less than the system's lowest supported nice value,
18116 *setpriority*( ) sets the nice value to the lowest supported value; if *value*+ {NZERO} is greater than
18117 the system's highest supported nice value, *setpriority*( ) sets the nice value to the highest
18118 supported value.

18119 Only a process with appropriate privileges can lower its nice value.

18120 PS | TPS Any processes or threads using SCHED_FIFO or SCHED_RR are unaffected by a call to
18121 *setpriority*( ). This is not considered an error.

18122 The effect of changing the nice value may vary depending on the process-scheduling algorithm
18123 in effect.

18124 Because *getpriority*( ) can return the value –1 on successful completion, it is necessary to set *errno*
18125 to 0 prior to a call to *getpriority*( ). If *getpriority*( ) returns the value –1, then *errno* can be checked
18126 to see if an error occurred or if the value is a legitimate nice value.

18127 **RETURN VALUE**

18128 Upon successful completion, *getpriority*( ) shall return an integer in the range from –{NZERO} to
18129 {NZERO}–1. Otherwise, –1 shall be returned and *errno* set to indicate the error.

18130 Upon successful completion, *setpriority*( ) shall return 0; otherwise, –1 shall be returned and *errno*
18131 set to indicate the error.

18132 **ERRORS**

18133 The *getpriority*( ) and *setpriority*( ) functions shall fail if:

18134 [ESRCH] No process could be located using the *which* and *who* argument values |
18135 specified.

[EINVAL] The value of the *which* argument was not recognized, or the value of the *who* argument is not a valid process ID, process group ID, or user ID.

In addition, *setpriority*( ) may fail if:

[EPERM] A process was located, but neither the real nor effective user ID of the executing process match the effective user ID of the process whose nice value is being changed.

[EACCES] A request was made to change the nice value to a lower numeric value and the current process does not have appropriate privileges.

EXAMPLES

Using getpriority( )

The following example returns the current scheduling priority for the process ID returned by the call to *getpid*( ).

```
#include <sys/resource.h>
...
int which = PRIO_PROCESS;
id_t pid;
int ret;

pid = getpid();
ret = getpriority(which, pid);
```

Using setpriority( )

The following example sets the priority for the current process ID to –20.

```
#include <sys/resource.h>
...
int which = PRIO_PROCESS;
id_t pid;
int priority = -20;
int ret;

pid = getpid();
ret = setpriority(which, pid, priority);
```

APPLICATION USAGE

The *getpriority*( ) and *setpriority*( ) functions work with an offset nice value (nice value –{NZERO}). The nice value is in the range [0,2*{NZERO} –1], while the return value for *getpriority*( ) and the third parameter for *setpriority*( ) are in the range [–{NZERO},{NZERO} –1].

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The DESCRIPTION is reworded in terms of the nice value rather than *priority* to avoid confusion with functionality in the POSIX Realtime Extension.

18182 **NAME**

18183 getprotobyname — network protocol database functions

18184 **SYNOPSIS**

18185 `#include <netdb.h>`

18186 `struct protoent *getprotobyname(const char *`*`name`*`);`

18187 **DESCRIPTION**

18188 Refer to *endprotoent*( ).

18189 **NAME**

18190 getprotobynumber — network protocol database functions

18191 **SYNOPSIS**

18192 `#include <netdb.h>`

18193 `struct protoent *getprotobynumber(int proto);`

18194 **DESCRIPTION**

18195 Refer to *endprotoent*( ).

18196 **NAME**

18197 getprotoent — network protocol database functions

18198 **SYNOPSIS**

18199 `#include <netdb.h>`

18200 `struct protoent *getprotoent(void);`

18201 **DESCRIPTION**

18202 Refer to *endprotoent*( ).

18203 **NAME**

18204 getpwent — get user database entry

18205 **SYNOPSIS**

18206 XSI
```
#include <pwd.h>
```

18207
```
struct passwd *getpwent(void);
```

18208

18209 **DESCRIPTION**

18210 Refer to *endpwent*( ).

18211 **NAME**

18212 getpwnam, getpwnam_r — search user database for a name

18213 **SYNOPSIS**

18214 ```
#include <pwd.h>
```

18215 ```
struct passwd *getpwnam(const char *name);
```

18216 TSF ```
int getpwnam_r(const char *name, struct passwd *pwd, char *buffer,
```

18217 ```
    size_t bufsize, struct passwd **result);
```

18218

18219 **DESCRIPTION**

18220 The *getpwnam*( ) function shall search the user database for an entry with a matching *name*.

18221 The *getpwnam*( ) function need not be reentrant. A function that is not required to be reentrant is
18222 not required to be thread-safe.

18223 Applications wishing to check for error situations should set *errno* to 0 before calling
18224 *getpwnam*( ). If *getpwnam*( ) returns a null pointer and *errno* is non-zero, an error occurred.

18225 TSF The *getpwnam_r*( ) function updates the **passwd** structure pointed to by *pwd* and stores a pointer
18226 to that structure at the location pointed to by *result*. The structure shall contain an entry from
18227 the user database with a matching *name*. Storage referenced by the structure is allocated from
18228 the memory provided with the *buffer* parameter, which is *bufsize* characters in size.

18229 ***Notes to Reviewers***

18230 *This section with side shading will not appear in the final copy. - Ed.*

18231 D3, XSH, ERN 301 says that the size above is in bytes, not characters, and proposes changing
18232 "characters" to "bytes".

18233 The maximum size needed for this buffer can be determined with the
18234 {_SC_GETPW_R_SIZE_MAX} *sysconf*( ) parameter. A NULL pointer shall be returned at the
18235 location pointed to by *result* on error or if the requested entry is not found.

18236 **RETURN VALUE**

18237 The *getpwnam*( ) function shall return a pointer to a **struct passwd** with the structure as defined
18238 in **<pwd.h>** with a matching entry if found. A null pointer shall be returned if the requested
18239 entry is not found, or an error occurs. On error, *errno* shall be set to indicate the error.

18240 The return value may point to a static area which is overwritten by a subsequent call to
18241 *getpwent*( ), *getpwnam*( ), or *getpwuid*( ).

18242 TSF If successful, the *getpwnam_r*( ) function shall return zero; otherwise, an error number shall be
18243 returned to indicate the error.

18244 **ERRORS**

18245 The *getpwnam*( ) and *getpwnam_r*( ) functions may fail if:

18246 [EIO] An I/O error has occurred.

18247 [EINTR] A signal was caught during *getpwnam*( ).

18248 [EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

18249 [ENFILE] The maximum allowable number of files is currently open in the system.

18250 TSF The *getpwnam_r*( ) function may fail if:

18251 TSF [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to
18252 be referenced by the resulting **passwd** structure.

EXAMPLES

Getting an Entry for the Login Name

The following example uses the *getlogin*( ) function to return the name of the user who logged in; this information is passed to the *getpwnam*( ) function to get the user database entry for that user.

```
#include <sys/types.h>
#include <pwd.h>
#include <unistd.h>
#include <stdio.h>
#include <stdlib.h>
...
char *lgn;
struct passwd *pw;
...
if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
    fprintf(stderr, "Get of user information failed.\n"); exit(1);
}
...
```

APPLICATION USAGE

Three names associated with the current process can be determined: *getpwuid*(*geteuid*( )) returns the name associated with the effective user ID of the process; *getlogin*( ) returns the name associated with the current login activity; and *getpwuid*(*getuid*( )) returns the name associated with the real user ID of the process.

The *getpwnam_r*( ) function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

getpwuid( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<limits.h>**, **<pwd.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 1. Derived from System V Release 2.0.

Issue 4

The DESCRIPTION is clarified.

The **<sys/types.h>** header is now marked as optional (OH); this header need not be included on XSI-conformant systems.

The last sentence in the RETURN VALUE section, indicating that *errno* is set on error, is marked as an extension.

The errors [EIO], [EINTR], [EMFILE], and [ENFILE] are marked as extensions.

The APPLICATION USAGE section is expanded to warn about possible reuses of the area used to pass the return value, and to indicate how applications should check for errors.

The following change is incorporated for alignment with the ISO POSIX-1 standard:

- The type of argument *name* is changed from **char*** to **const char***.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The *getpwnam_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *getpwnam*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *getpwnam_r*( ) function is marked as part of the Thread-Safe Functions option.

The Open Group corrigenda item U028/3 has been applied correcting text in the DESCRIPTION describing matching the *name*.

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EMFILE], [ENFILE], and [ENXIO] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

18318 **NAME**

18319 getpwuid, getpwuid_r — search user database for a user ID

18320 **SYNOPSIS**

18321 `#include <pwd.h>`

18322 `struct passwd *getpwuid(uid_t uid);`

18323 TSF `int getpwuid_r(uid_t uid, struct passwd *pwd, char *buffer,`

18324 `size_t bufsize, struct passwd **result);`

18325

18326 **DESCRIPTION**

18327 The *getpwuid*( ) function shall search the user database for an entry with a matching *uid*.

18328 The *getpwuid*( ) function need not be reentrant. A function that is not required to be reentrant is
18329 not required to be thread-safe.

18330 Applications wishing to check for error situations should set *errno* to 0 before calling *getpwuid*( ). |
18331 If *getpwuid*( ) returns a null pointer and *errno* is set to non-zero, an error occurred. |

18332 TSF The *getpwuid_r*( ) function updates the **passwd** structure pointed to by *pwd* and stores a pointer |
18333 to that structure at the location pointed to by *result*. The structure shall contain an entry from
18334 the user database with a matching *uid*. Storage referenced by the structure is allocated from the
18335 memory provided with the *buffer* parameter, which is *bufsize* characters in size. The maximum
18336 size needed for this buffer can be determined with the {_SC_GETPW_R_SIZE_MAX} *sysconf*( )
18337 parameter. A NULL pointer shall be returned at the location pointed to by *result* on error or if the
18338 requested entry is not found. |

18339 **RETURN VALUE**

18340 The *getpwuid*( ) function shall return a pointer to a **struct passwd** with the structure as defined in
18341 **<pwd.h>** with a matching entry if found. A null pointer shall be returned if the requested entry |
18342 is not found, or an error occurs. On error, *errno* shall be set to indicate the error. |

18343 The return value may point to a static area which is overwritten by a subsequent call to
18344 *getpwent*( ), *getpwnam*( ), or *getpwuid*( ).

18345 TSF If successful, the *getpwuid_r*( ) function shall return zero; otherwise, an error number shall be
18346 returned to indicate the error.

18347 **ERRORS**

18348 The *getpwuid*( ) and *getpwuid_r*( ) functions may fail if: |

18349 [EIO] An I/O error has occurred. |

18350 [EINTR] A signal was caught during *getpwuid*( ). |

18351 [EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process. |

18352 [ENFILE] The maximum allowable number of files is currently open in the system. |

18353 TSF The *getpwuid_r*( ) function may fail if:

18354 TSF [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to |
18355 be referenced by the resulting **passwd** structure.

EXAMPLES

Getting an Entry for the Root User

The following example gets the user database entry for the user with user ID 0 (root).

```
#include <sys/types.h>
#include <pwd.h>
...
uid_t id = 0;
struct passwd *pwd;

pwd = getpwuid(id);
```

Finding the Name for the Effective User ID

The following example defines *pws* as a pointer to a structure of type **passwd**, which is used to store the structure pointer returned by the call to the *getpwuid*( ) function. The *geteuid*( ) function shall return the effective user ID of the calling process; this is used as the search criteria for the *getpwuid*( ) function. The call to *getpwuid*( ) shall return a pointer to the structure containing that user ID value.

```
#include <unistd.h>
#include <sys/types.h>
#include <pwd.h>
...
struct passwd *pws;
pws = getpwuid(geteuid());
```

Finding an Entry in the User Database

The following example uses *getpwuid*( ) to search the user database for a user ID that was previously stored in a **stat** structure, then prints out the user name if it is found. If the user is not found, the program prints the numeric value of the user ID for the entry.

```
#include <sys/types.h>
#include <pwd.h>
#include <stdio.h>
...
struct stat statbuf;
struct passwd *pwd;
...
if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
    printf(" %-8.8s", pwd->pw_name);
else
    printf(" %-8d", statbuf.st_uid);
```

APPLICATION USAGE

Three names associated with the current process can be determined: *getpwuid*(*geteuid*( )) returns the name associated with the effective user ID of the process; *getlogin*( ) returns the name associated with the current login activity; and *getpwuid*(*getuid*( )) returns the name associated with the real user ID of the process.

The *getpwuid_r*( ) function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

18399 **RATIONALE**

18406 **CHANGE HISTORY**

18407 First released in Issue 1. Derived from System V Release 2.0. |

18408 **Issue 4**

18409 The DESCRIPTION is clarified.

18410 The **<sys/types.h>** header is now marked as optional (OH); this header need not be included on
18411 XSI-conformant systems.

18412 The last sentence in the RETURN VALUE section, indicating that *errno* is set on error, is marked
18413 as an extension.

18414 The errors [EIO], [EINTR], [EMFILE], and [ENFILE] are marked as extensions.

18415 A note is added to the APPLICATION USAGE section indicating how an application should
18416 check for errors.

18417 **Issue 5**

18418 Normative text previously in the APPLICATION USAGE section is moved to the RETURN
18419 VALUE section.

18420 The *getpwuid_r*( ) function is included for alignment with the POSIX Threads Extension.

18421 A note indicating that the *getpwuid*( ) function need not be reentrant is added to the
18422 DESCRIPTION.

18423 **Issue 6**

18424 The *getpwuid_r*( ) function is marked as part of the Thread-Safe Functions option. |

18425 The Open Group corrigenda item U028/3 has been applied correcting text in the DESCRIPTION
18426 describing matching the *uid*.

18427 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

18428 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

18429 The following new requirements on POSIX implementations derive from alignment with the
18430 Single UNIX Specification:

18431 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
18432 required for conforming implementations of previous POSIX specifications, it was not
18433 required for UNIX applications.

18434 • In the RETURN VALUE section, the requirement to set *errno* on error is added.

18435 • The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

18436 The APPLICATION USAGE section is updated to include a note on the thread-safe function and
18437 its avoidance of possibly using a static data area.

18438 **NAME**

18439 getrlimit, setrlimit — control maximum resource consumption

18440 **SYNOPSIS**

18441 XSI
```
#include <sys/resource.h>

int getrlimit(int resource, struct rlimit *rlp);
int setrlimit(int resource, const struct rlimit *rlp);
```
18444

18445 **DESCRIPTION**

18446 Limits on the consumption of a variety of resources by the calling process may be obtained with
18447 *getrlimit*( ) and set with *setrlimit*( ).

18448 Each call to either *getrlimit*( ) or *setrlimit*( ) identifies a specific resource to be operated upon as
18449 well as a resource limit. A resource limit is represented by an **rlimit** structure. The *rlim_cur*
18450 member specifies the current or soft limit and the *rlim_max* member specifies the maximum or
18451 hard limit. Soft limits may be changed by a process to any value that is less than or equal to the
18452 hard limit. A process may (irreversibly) lower its hard limit to any value that is greater than or
18453 equal to the soft limit. Only a process with appropriate privileges can raise a hard limit. Both
18454 hard and soft limits can be changed in a single call to *setrlimit*( ) subject to the constraints
18455 described above.

18456 The value RLIM_INFINITY, defined in **<sys/resource.h>**, shall be considered to be larger than
18457 any other limit value. If a call to *getrlimit*( ) returns RLIM_INFINITY for a resource, it means the
18458 implementation shall not enforce limits on that resource. Specifying RLIM_INFINITY as any
18459 resource limit value on a successful call to *setrlimit*( ) inhibits enforcement of that resource limit.

18460 The following resources are defined:

18461 RLIMIT_CORE — This is the maximum size of a core file in bytes that may be created by a
18462 process. A limit of 0 shall prevent the creation of a core file. If this limit is
18463 exceeded, the writing of a core file shall terminate at this size.

18464 RLIMIT_CPU — This is the maximum amount of CPU time in seconds used by a process.
18465 If this limit is exceeded, SIGXCPU shall be generated for the process. If
18466 the process is catching or ignoring SIGXCPU, or all threads belonging to
18467 that process are blocking SIGXCPU, the behavior is unspecified.

18468 RLIMIT_DATA — This is the maximum size of a process' data segment in bytes. If this limit
18469 is exceeded, the *malloc*( ) function shall fail with *errno* set to [ENOMEM].

18470 RLIMIT_FSIZE — This is the maximum size of a file in bytes that may be created by a
18471 process. If a write or truncate operation would cause this limit to be
18472 exceeded, SIGXFSZ shall be generated for the thread. If the thread is
18473 blocking, or the process is catching or ignoring SIGXFSZ, continued
18474 attempts to increase the size of a file from end-of-file to beyond the limit
18475 shall fail with *errno* set to [EFBIG].

18476 RLIMIT_NOFILE — This is a number one greater than the maximum value that the system
18477 may assign to a newly-created descriptor. If this limit is exceeded,
18478 functions that allocate new file descriptors may fail with *errno* set to
18479 [EMFILE]. This limit constrains the number of file descriptors that a
18480 process may allocate.

18481 RLIMIT_STACK — This is the maximum size of a process' stack in bytes. The
18482 implementation does not automatically grow the stack beyond this limit.
18483 If this limit is exceeded, SIGSEGV shall be generated for the thread. If the

thread is blocking SIGSEGV, or the process is ignoring or catching SIGSEGV and has not made arrangements to use an alternate stack, the disposition of SIGSEGV shall be set to SIG_DFL before it is generated.

RLIMIT_AS — This is the maximum size of a process' total available memory, in bytes. If this limit is exceeded, the *malloc*( ) and *mmap*( ) functions shall fail with *errno* set to [ENOMEM]. In addition, the automatic stack growth fails with the effects outlined above.

When using the *getrlimit*( ) function, if a resource limit can be represented correctly in an object of type **rlim_t**, then its representation is returned; otherwise, if the value of the resource limit is equal to that of the corresponding saved hard limit, the value returned shall be RLIM_SAVED_MAX; otherwise, the value returned shall be RLIM_SAVED_CUR.

When using the *setrlimit*( ) function, if the requested new limit is RLIM_INFINITY, the new limit shall be ''no limit''; otherwise, if the requested new limit is RLIM_SAVED_MAX, the new limit shall be the corresponding saved hard limit; otherwise, if the requested new limit is RLIM_SAVED_CUR, the new limit shall be the corresponding saved soft limit; otherwise, the new limit shall be the requested value. In addition, if the corresponding saved limit can be represented correctly in an object of type **rlim_t** then it shall be overwritten with the new limit.

The result of setting a limit to RLIM_SAVED_MAX or RLIM_SAVED_CUR is unspecified unless a previous call to *getrlimit*( ) returned that value as the soft or hard limit for the corresponding resource limit.

The determination of whether a limit can be correctly represented in an object of type **rlim_t** is implementation-defined. For example, some implementations permit a limit whose value is greater than RLIM_INFINITY and others do not.

The *exec* family of functions also cause resource limits to be saved.

RETURN VALUE

Upon successful completion, *getrlimit*( ) and *setrlimit*( ) shall return 0. Otherwise, these functions shall return −1 and set *errno* to indicate the error.

ERRORS

The *getrlimit*( ) and *setrlimit*( ) functions shall fail if:

[EINVAL] — An invalid *resource* was specified; or in a *setrlimit*( ) call, the new *rlim_cur* exceeds the new *rlim_max*.

[EPERM] — The limit specified to *setrlimit*( ) would have raised the maximum limit value, and the calling process does not have appropriate privileges.

The *setrlimit*( ) function may fail if:

[EINVAL] — The limit specified cannot be lowered because current usage is already higher than the limit.

EXAMPLES

None.

APPLICATION USAGE

If a process attempts to set the hard limit or soft limit for RLIMIT_NOFILE to less than the value of {_POSIX_OPEN_MAX} from **<limits.h>**, unexpected behavior may occur.

18525 **RATIONALE**

18526 None.

18527 **FUTURE DIRECTIONS**

18528 None.

18529 **SEE ALSO**

18530 *exec*, *fork*( ), *malloc*( ), *open*( ), *sigaltstack*( ), *sysconf*( ), *ulimit*( ), the Base Definitions volume of |
18531 IEEE Std. 1003.1-200x, **<stropts.h>**, **<sys/resource.h>** |

18532 **CHANGE HISTORY**

18533 First released in Issue 4, Version 2.

18534 **Issue 5**

18535 Moved from X/OPEN UNIX extension to BASE and an APPLICATION USAGE section is added.

18536 Large File Summit extensions are added.

18537 **NAME**

18538 getrusage — get information about resource utilization

18539 **SYNOPSIS**

18540 XSI
```
#include <sys/resource.h>

int getrusage(int who, struct rusage *r_usage);
```
18541

18542

18543 **DESCRIPTION**

18544 The *getrusage*( ) function provides measures of the resources used by the current process or its
18545 terminated and waited-for child processes. If the value of the *who* argument is RUSAGE_SELF,
18546 information shall be returned about resources used by the current process. If the value of the *who*
18547 argument is RUSAGE_CHILDREN, information shall be returned about resources used by the
18548 terminated and waited-for children of the current process. If the child is never waited for (for
18549 example, if the parent has SA_NOCLDWAIT set or sets SIGCHLD to SIG_IGN), the resource
18550 information for the child process is discarded and not included in the resource information
18551 provided by *getrusage*( ).

18552 The *r_usage* argument is a pointer to an object of type **struct rusage** in which the returned
18553 information is stored.

18554 **RETURN VALUE**

18555 Upon successful completion, *getrusage*( ) shall return 0; otherwise, –1 shall be returned and *errno*
18556 set to indicate the error.

18557 **ERRORS**

18558 The *getrusage*( ) function shall fail if:

18559 [EINVAL] The value of the *who* argument is not valid. |

18560 **EXAMPLES**

18561 **Using getrusage( )**

18562 The following example returns information about the resources used by the current process.

```
18563 #include <sys/resource.h>
18564 ...
18565 int who = RUSAGE_SELF;
18566 struct rusage usage;
18567 int ret;

18568 ret = getrusage(who, &usage);
```

18569 **APPLICATION USAGE**

18570 None.

18571 **RATIONALE**

18572 None.

18573 **FUTURE DIRECTIONS**

18574 None.

18575 **SEE ALSO**

18577 **<sys/resource.h>**

18578 **CHANGE HISTORY**

18579 First released in Issue 4, Version 2.

18580 **Issue 5**

18581 Moved from X/OPEN UNIX extension to BASE.

18582 **NAME**

18583 gets — get a string from a stdin stream

18584 **SYNOPSIS**

18585 ```
#include <stdio.h>
```

18586 ```
char *gets(char *s);
```

18587 **DESCRIPTION**

18588 CX The functionality described on this reference page is aligned with the ISO C standard. Any
18589 conflict between the requirements described here and the ISO C standard is unintentional. This
18590 volume of IEEE Std. 1003.1-200x defers to the ISO C standard.

18591 The *gets*( ) function shall read bytes from the standard input stream, *stdin*, into the array pointed
18592 to by *s*, until a newline is read or an end-of-file condition is encountered. Any newline is
18593 discarded and a null byte is placed immediately after the last byte read into the array.

18594 CX The *gets*( ) function may mark the *st_atime* field of the file associated with *stream* for update. The
18595 *st_atime* field shall be marked for update by the first successful execution of *fgetc*( ), *fgets*( ),
18596 *fread*( ), *getc*( ), *getchar*( ), *gets*( ), *fscanf*( ), or *scanf*( ) using *stream* that returns data not supplied by
18597 a prior call to *ungetc*( ).

18598 **RETURN VALUE**

18599 Upon successful completion, *gets*( ) shall return *s*. If the stream is at end-of-file, the end-of-file
18600 indicator for the stream shall be set and *gets*( ) shall return a null pointer. If a read error occurs,
18601 CX the error indicator for the stream shall be set, *gets*( ) shall return a null pointer and set *errno* to
18602 indicate the error.

18603 **ERRORS**

18604 Refer to *fgetc*( ).

18605 **EXAMPLES**

18606 None.

18607 **APPLICATION USAGE**

18608 Reading a line that overflows the array pointed to by *s* results in undefined behavior. The use of
18609 *fgets*( ) is recommended.

18610 Since the user cannot specify the length of the buffer passed to *gets*( ), use of this function is
18611 discouraged. The length of the string read is unlimited. It is possible to overflow this buffer in
18612 such a way as to cause applications to fail, or possible system security violations.

18613 It is recommended that the *fgets*( ) function should be used to read input lines.

18614 **RATIONALE**

18615 None.

18616 **FUTURE DIRECTIONS**

18617 None.

18618 **SEE ALSO**

18619 *feof*( ), *ferror*( ), *fgets*( ), the Base Definitions volume of IEEE Std. 1003.1-200x, **<stdio.h>**

18620 **CHANGE HISTORY**

18621 First released in Issue 1. Derived from Issue 1 of the SVID.

18622 **Issue 4**

18623 In the DESCRIPTION:

18624 • The text is changed to make it clear that the function reads bytes rather than (possibly multi-
18625 byte) characters.

- The list of functions that may cause the *st_atime* field to be updated is revised.

Issue 6

Extensions beyond the ISO C standard are now marked.

18629 **NAME**

18630 getservbyname — network services database functions

18631 **SYNOPSIS**

18632 `#include <netdb.h>`

18633 `struct servent *getservbyname(const char *`*`name`*`, const char *`*`proto`*`);`

18634 **DESCRIPTION**

18635 Refer to *endservent*( ).

18636 **NAME**

18637 getservbyport — network services database functions

18638 **SYNOPSIS**

18639 `#include <netdb.h>`

18640 `struct servent *getservbyport(int` *`port`*`, const char *`*`proto`*`);`

18641 **DESCRIPTION**

18642 Refer to *endservent*( ).

18643 **NAME**

18644 getservent — network services database functions

18645 **SYNOPSIS**

18646 `#include <netdb.h>`

18647 `struct servent *getservent(void);`

18648 **DESCRIPTION**

18649 Refer to *endservent*( ).

18650 **NAME**

18651 getsid — get the process group ID of a session leader

18652 **SYNOPSIS**

18653 XSI
```
#include <unistd.h>
```

18654
```
pid_t getsid(pid_t pid);
```

18655

18656 **DESCRIPTION**

18657 The *getsid*( ) function obtains the process group ID of the process that is the session leader of the
18658 process specified by *pid*. If *pid* is (**pid_t**)0, it specifies the calling process.

18659 **RETURN VALUE**

18660 Upon successful completion, *getsid*( ) shall return the process group ID of the session leader of
18661 the specified process. Otherwise, it shall return (**pid_t**)–1 and set *errno* to indicate the error.

18662 **ERRORS**

18663 The *getsid*( ) function shall fail if:

18664 [EPERM] The process specified by *pid* is not in the same session as the calling process, |
18665 and the implementation does not allow access to the process group ID of the
18666 session leader of that process from the calling process.

18667 [ESRCH] There is no process with a process ID equal to *pid*. |

18668 **EXAMPLES**

18669 None.

18670 **APPLICATION USAGE**

18671 None.

18672 **RATIONALE**

18673 None.

18674 **FUTURE DIRECTIONS**

18675 None.

18676 **SEE ALSO**

18677 *exec*, *fork*( ), *getpid*( ), *getpgid*( ), *setpgid*( ), *setsid*( ), the Base Definitions volume of |
